TAKEOFF UPDATE

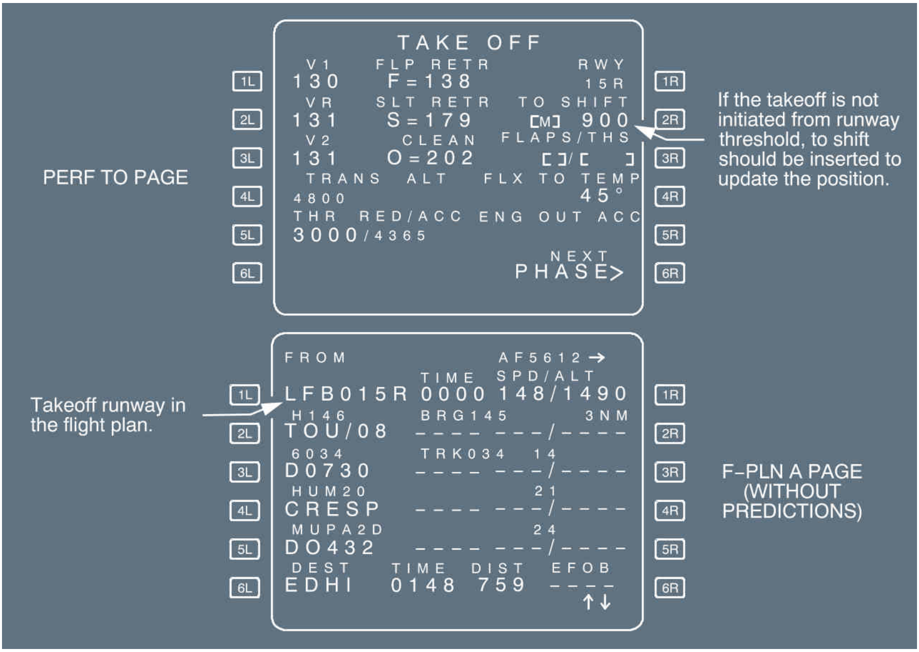
Ident.: DSC-22_20-20-10-00010137.0017001 / 04 AUG 16

Applicable to: ALL

A takeoff update requires that the takeoff runway be part of the flight plan. This provides the most accurate position update.

If the takeoff run starts at an intersection, enter a takeoff shift on the PERF TO page to refine the takeoff update.

An accurate takeoff update ensures a precise aircraft position during departure.



PERF TO PAGE

```
          TAKE OFF
 V1    FLP RETR          RWY
130    F=138             15R
 VR    SLT RETR     TO SHIFT
131    S=179        [M]  900
 V2       CLEAN   FLAPS/THS
131    O=202         [ ]/[  ]
 TRANS   ALT    FLX TO TEMP
4800                     45°
THR  RED/ACC  ENG OUT ACC
3000/4365
                     NEXT
                    PHASE>
```

If the takeoff is not initiated from runway threshold, to shift should be inserted to update the position.

Takeoff runway in the flight plan.

NAVIGATION MODES

Ident.: DSC-22_20-20-10-00010138.0001001 / 12 MAY 22

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

The FMGS updates the FM position via the use of radio navaids or GPS, if available. It can use four different FM navigation modes to make this update.

The decreasing order of priority is:
- IRS-GPS
- IRS-DME/DME
- IRS-VOR/DME
- IRS only.

During approach flown with ILS / MLS ⊲ / GLS ⊲ / SLS ⊲ / the system performs a temporary lateral update, via one of the following modes:
- IRS-GPS/LOC
- IRS-DME/DME-LOC

- IRS-VOR/DME-LOC
- IRS-LOC.

GENERAL

Ident.: DSC-22_20-20-20-00010448.0023001 / 27 MAY 13

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The FMGS continuously computes an Estimated Position Uncertainty (EPU).
It is an estimate of how much the FM position diverged, and it is a function of the navigation mode that the system uses.

CURRENT NAV MODE	**EPU (RATE or THRESHOLD)**	**REMARK**
IRS/GPS	$\sqrt{(FOM^2 + 100^2)}$ (in meters).	FOM = Figure of Merit of GPS. If above 0.28 NM, the FMS rejects the GPS position.
IRS/DME/DME	Moves toward 0.28 NM.	EPU decreases from initial value to 0.28 NM.
IRS/VOR/DME	0.1 NM + 0.05 X DME DIST. Minimum : 0.28 NM.	Dependent on the distance between the aircraft and the VOR/DME.
IRS ONLY	+8 nm/h for the first 30 min. 0 nm/h for the following 60 min. +4 nm/h for the following 30 min. 0 nm/h for the following 60 min. +2 nm/h after.	EPU increases continuously.

Note: *After an IRS alignment or at takeoff, the EPU is set to 0.2 NM.*

GENERAL

Ident.: DSC-22_20-20-20-00010448.0044001 / 27 MAY 13

Applicable to: MSN 04827-04860

The FMGS continuously computes an Estimated Position Uncertainty (EPU).
It is an estimate of how much the FM position diverged, and it is a function of the navigation mode that the system uses.

CURRENT NAV MODE	**EPU (RATE or THRESHOLD)**	**REMARK**
IRS/GPS	0.05 NM.	
IRS/DME/DME	0.27 NM - 0.37 NM.	
IRS/VOR/DME	0.30 NM - 0.42 NM.	Dependent on the distance between the aircraft and the VOR/DME.
IRS ONLY	+6 nm/h for the first 40 min. 0 nm/h for the following 50 min. +4 nm/h for the following 40 min. 0 nm/h for the following 45 min. +2 nm/h after.	EPU increases continuously.

Note: - *After an IRS alignment, the EPU is set at 5 NM.*
- *At takeoff, the EPU is set at 0.2 NM.*

ESTIMATED POSITION UNCERTAINTY

Ident.: DSC-22_20-20-20-00010499.0077001 / 23 JUN 15
Applicable to: MSN 04827-04860

The FMS displays the EPU to the flight crew and compares it with the Required Navigation Performance (RNP):
- If the EPU does not exceed the RNP, accuracy is HIGH
- If the EPU exceeds the RNP, accuracy is LOW.

The RNP is displayed in the REQUIRED field of the PROG page. The displayed RNP is (in a decreasing order of priority):
- The value that the flight crew entered
- The navigation database procedure value
- The system's default value.

When a flight crew enters an RNP that is higher than the published value, one of the following messages is displayed : "PROCEDURE RNP IS XX.XX", or "AREA RNP IS XX.XX". When this occurs, the flight crew should verify the RNP value that was manually entered in the REQUIRED field of the PROG page, and clear or modify it if necessary.
The "AREA RNP IS XX.XX" message is also displayed at the change of flight area if the new RNP (default value) is smaller than the displayed RNP (manually entered).

DEFAULT AREA RNP VALUES	
EN ROUTE	2.0 NM
TERMINAL	1.0 NM
APPROACH	GPS / RNAV(GNSS) 0.3 NM OTHER CASES 0.5 NM

When one FMGC changes the NAV accuracy from LOW to HIGH (or HIGH to LOW), the MCDU and the ND display the "NAV ACCUR UPGRAD" (or DOWNGRAD) message.

NAV ACCUR UPGRAD
This message appears on the ND and any MCDU page

When in IRS/GPS mode, the GPS PRIMARY status combines two different criteria:

- The accuracy criterion previously described (HIGH/LOW accuracy)
- An integrity criterion: This is the capability to detect a failure and provide appropriate warning of it. This criterion indicates the confidence that the flight crew can have in the FMS position.

If the GPS PRIMARY status complies with both criteria, "GPS PRIMARY" is displayed on the MCDU (PROG page, [5R] field and scratchpad) and temporarily on the ND.
If the GPS PRIMARY status no longer complies with one of these criteria (Navigation downgraded or integrity lost), the GPS PRIMARY status is lost and the MCDU and the ND display the "GPS PRIMARY LOST" message. It is possible to clear the scratchpad message on the MCDU, but not on the ND.

CAUTION	"HIGH" or "LOW" on the PROG page indicates the FM position accuracy, based on estimated uncertainty. When GPS PRIMARY mode is lost, the flight crew must periodically check this position accuracy. In GPS PRIMARY mode, the position accuracy is always at HIGH.

Applicable to: ALL

When the GPS PRIMARY function is active, and either of the FM positions deviate from the GPS positions 1 or 2 by more than:

- A longitude threshold that depends on the latitude:
  - 0.5' for latitudes below 55°
  - 0.9' for latitudes at or above 55°, and below 70°.
- A latitude threshold of 0.5', regardless of the latitude,

then, the lower ECAM displays the NAV FM/GPS POS DISAGREE amber caution. The master caution light comes on and the single chime sounds.
This amber caution is inhibited during the takeoff phase.
Above 70° of latitude, a longitude difference does not trigger the alarm.

Intentionally left blank

GENERAL

Ident.: DSC-22_20-20-30-00010478.0001001 / 17 AUG 10
Applicable to: ALL

Radio navaids are tuned for two different purposes: Display and computation.

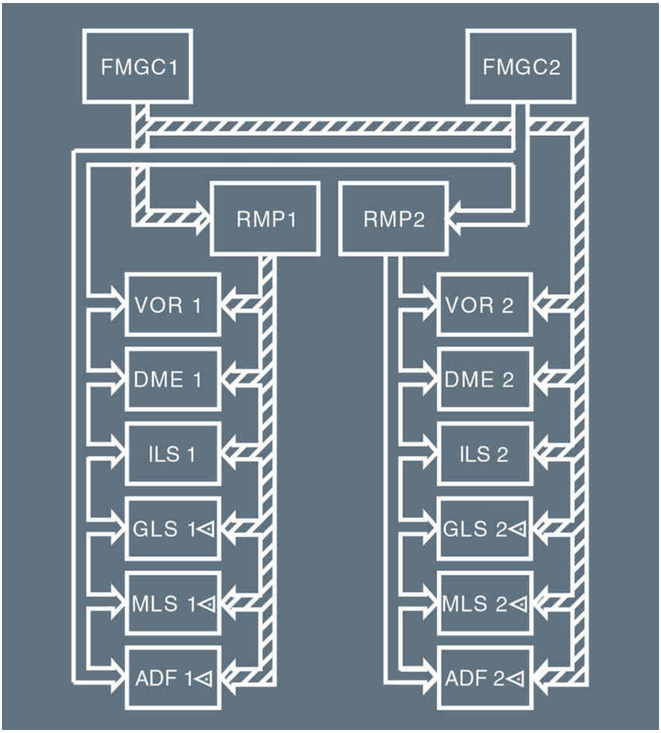
It is possible to perform tuning for display in three different ways:
- Automatic tuning via FMGC software
- Manual tuning via the MCDU RAD NAV page
- Manual tuning via the Radio Management Panel (RMP) if both FMGCs or both MCDUs fail.

The FMGS automatically tunes the radio navaids for computation of the radio position.

Note: *The manual selection of a VOR or VOR/DME may prevent the FMGS from automatically tuning a VOR/DME to compute position. In this case, the related MCDU displays “TUNE BBB FFF.FF” (BBB = ident, FFF.FF = frequency).*

ARCHITECTURE

Ident.: DSC-22_20-20-30-00010479.0001001 / 31 AUG 17
Applicable to: ALL



- In dual mode and independent mode, each FMGC simultaneously tunes the navaids on its own side (one VOR, one DME, one ILS, one GLS ◁ , one MLS ◁ and one ADF). In these modes, the flight crew can also manually tune the VOR (and associated DME), ILS, GLS ◁ , MLS ◁ and ADF ◁ .
- In single mode, the valid FMGC tunes navaids on both sides. The flight crew can also use the RAD NAV page to manually tune both VORs, both ADFs ◁ , and the ILS / GLS ◁ / MLS ◁ .

Manual tuning has priority over automatic tuning.

Note: *If one receiver fails, both FMGCs use the operative radio receiver to compute the position of the aircraft.*

VOR

Ident.: DSC-22_20-20-30-00010480.0001001 / 17 AUG 10
Applicable to: ALL

Each FMGC may tune only one VOR (manually or automatically).

Automatic tuning complies with the following priorities for tuning the VOR:
1. The specified navaid for the approach
2. The navaid that the flight crew should use to compute the current radio position
3. For display purposes:
   - A navaid specified for the active flight leg
   - The “TO” waypoint (TO WPT), if it is a navaid
   - The “FROM” waypoint (FROM WPT), if it is a navaid
   - A waypoint farther along the flight path, if it is a navaid
   - The navaid closest to the current position of the aircraft.

The scratchpad displays “SPECIFIC VOR-D UNAVAIL”, if the VOR or the VOR/DME that the flight crew requires for tuning is deselected.

DME

Ident.: DSC-22_20-20-30-00010481.0001001 / 17 AUG 10
Applicable to: MSN 04827-04860

Each FMGC automatically uses its five DME frequencies as follows:
- One DME frequency for display. It is possible to tune it manually or automatically.
- Two DME frequencies in DME/DME mode for calculating the radio position of the aircraft. The FMGC automatically tunes these as a function of their best accuracy. The flight crew does not receive any indication that this process is happening.
- One DME frequency automatically tuned for radio position. This occurs in the VOR/DME mode, when the DME/DME is not available and the flight crew complies with the conditions for a VOR/DME update. In this case, the VOR/DME that the flight crew uses for display, is identical to the VOR/DME navaid that the flight crew uses for computation of the radio position.
- One DME frequency is connected to the ILS/DME.

DME

Ident.: DSC-22_20-20-30-00010481.0002001 / 17 AUG 10
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

Each FMGC automatically uses its four DME frequencies as follows:
- One DME frequency for display. It is possible to tune it manually or automatically. This DME frequency is also used for VOR/DME position computation.
- Two DME frequencies in DME/DME mode for calculating the radio position of the aircraft. The FMGC automatically tunes these as a function of their best accuracy. The flight crew does not receive any indication that this process is happening.
- One DME frequency is connected to the ILS/DME.

ADF

Ident.: DSC-22_20-20-30-00010482.0001001 / 17 AUG 10
Applicable to: ALL

The FMGC automatically tunes one ADF, when the flight plan specifies a Non Directional Beacon (NDB) approach and a fix in the approach is the “TO” waypoint.
The scratchpad displays “SPECIFIC NDB UNAVAIL”, if the NDB that the flight crew requires for autotuning is deselected.

ILS

Ident.: DSC-22_20-20-30-00010483.0001001 / 17 AUG 10
Applicable to: ALL

Each FMGC automatically tunes one ILS frequency:
- In the PREFLIGHT or TAKEOFF phase, when the takeoff runway has an associated ILS.
- In the CLIMB, CRUISE, DESCENT, APPROACH, or GO-AROUND phase, when the type of approach in the flight plan is ILS.

The scratchpad displays “RWY/ILS MISMATCH” when the flight crew manually tunes the ILS and the entered frequency does not agree with the ILS or the LOC IDENT/FREQ that the flight crew requests for automatic tuning. The FMGS logic does not enable the flight crew to modify the course of an ILS when its frequency is identical to the ILS selected in the F-PLN.

GLS

Ident.: DSC-22_20-20-30-00012868.0001001 / 16 MAR 11
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

Each FMGC autotunes one GLS channel in the CLIMB, CRUISE, DESCENT, APPROACH, or GO-AROUND phase, when the type of approach in the flight plan is GLS.

The scratchpad displays “RWY/LS MISMATCH” when the flight crew has manually tuned the GLS and the entered channel does not match the GLS IDENT/CHAN requested for autotuning.
The FMGS logic does not allow the flight crew to modify the course of a GLS when its channel is identical to the GLS selected in the F-PLN.

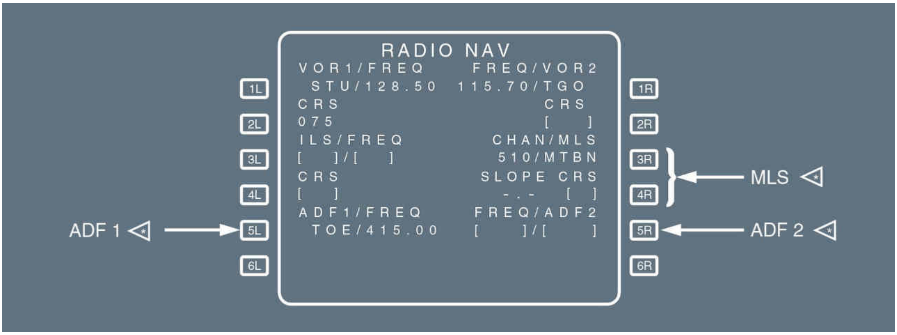
SELECTION OF NAVAIDS ON MCDU PAGES

Ident.: DSC-22_20-20-30-00010485.0032001 / 31 AUG 17
Applicable to: ALL

The MCDU displays the navaids tuned by the FMGC on two pages:
- RADIO NAV Page
- SELECTED NAVAIDS Page.

RADIO NAV PAGE

This page shows which navaids have been tuned automatically or manually for display purposes.



```
               RADIO NAV

- **If the MCDU displays "NOT IN DATA BASE":**

  INSERT the frequency.

  DISREGARD the ident that appears in small font on the MCDU.

  When a frequency is entered in the VOR field, the FMGC automatically associates to the tuned frequency the closest navaid identifier with the same frequency, and displays it on the RAD NAV page. This identifier may not correspond to the tuned navaid.

If the closest navaid, found in the database, is of a different type (e.g. VOR instead of VOR/DME), the flight crew will obtain a partial tuning (e.g. VOR indication instead of VOR/DME indication).

ENTER the course.

NAVAID IDENTIFICATION

Ident.: DSC-22_20-20-30-00010487.0001001 / 12 MAY 22
Applicable to: ALL

CHECK the xLS (ILS or GLS or MLS or SLS) identifier decoded on the PFD, and the VOR or ADF on the ND.
When the navaid identifier is decoded in agreement with that published, no audio check is necessary.
When the decoding is different from the published one, check the audio. Due to morse coding inaccuracy, wrong decoding may sometimes occur.
For GLS , the audio signal may be inaudible. However, the GLS identifier displayed on ND and PFD is raw data. Consequently, for GLS , no audio check is necessary.
For SLS , no audio signal is available.

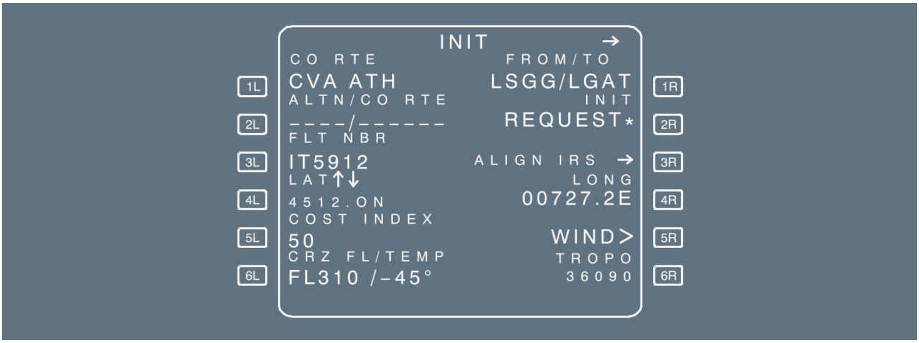
Note: *When a DME or a TACAN only is selected using either its identifier or its frequency, the NDs do not display the decoded indication.*

ALIGNMENT OF INERTIAL REFERENCE SYSTEM

Ident.: DSC-22_20-20-40-00010143.0002001 / 01 OCT 12

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

The FMGS uses the reference point coordinates of the departure airport to align the IRS.
It calls these up from the database automatically after the flight crew has entered a company route or an origin-destination city pair and pressed the ALIGN IRS key on the MCDU. The flight crew can adjust these coordinates manually to the gate position. A normal alignment takes 10 min, a fast alignment 30 s.
Fast alignment is used to refine a position when time is limited.



```
                  INIT                 →
CO RTE                     FROM/TO
CVA ATH                   LSGG/LGAT
ALTN/CO RTE                     INIT
----/------               REQUEST*
FLT NBR
IT5912                  ALIGN IRS →
LAT↑↓                           LONG
4512.0N                     00727.2E
COST INDEX
50                             WIND>
CRZ FL/TEMP                    TROPO
FL310 /-45°                    36090
```

Note: *If "ALIGN" flashes on the ADIRS overhead CDU during the alignment process, it indicates one of the following:*
- *It has detected excessive motion. (It automatically restarts the alignment)*
- *It has detected a disagreement between the position the MCDU has sent to the IRS, and the last memorized IRS position. The flight crew must enter new coordinates in the MCDU, and realign the IRS*
- *It has detected a disagreement between the latitude the MCDU has sent to the IRS, and the latitude the IRS has computed during the alignment*
- *The IRS has not received a position from the MCDU or the ADIRS overhead CDU.*

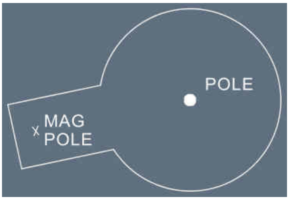
POLAR NAVIGATION

Ident.: DSC-22_20-20-40-00010145.0001001 / 27 MAY 13
Applicable to: MSN 02887

IRS are able to provide MAG HEADING between latitudes 82°N and 60°S, except in the vicinity of North magnetic pole.
The FMGC computes the aircraft position within polar area even at North pole using the MIX IRS position.

Note: *The IRS may be aligned up to latitude 73° without any particular procedures. Between 73° and 82° (North or South), the required alignment time is greater and a specific procedure has to be performed. Beyond 82° North or South, no ADIRS alignment is possible.*



As a general rule, the MCDU displays all parameters referenced to North according to the NORTH REF pb-sw position.
In order to provide the SAFEST and most FLEXIBLE operation, a MAG/TRUE NORTH REF pb-sw is available, with various messages provided on the EFIS ND, the MCDU, and the ECAM, indicating to the flight crew what reference should be applicable in the flight area the aircraft is located.

GENERAL

Ident.: DSC-22_20-20-50-00010410.0001001 / 09 MAR 15
Applicable to: ALL

Overall navigation performance is mainly based on two elements:
- The accuracy of the aircraft position calculation
- The validity of the flight path definition, as extracted from the navigation database.

The level of validation depends on the type of operations. For example, JAA TGL 10 requires that, for Precision RNAV in terminal area, providers and operators implement a quality assurance program for the navigation database, which may include a navigation database validation process. The highest level of validation is required for RNAV approach, with lateral and vertical navigation.
The navigation databases are revised every 28 days (AIRAC cycle). Flights should be conducted with a navigation database that is within its cycle. This should be checked on the AIRCRAFT STATUS MCDU page.

Intentionally left blank

GENERAL

1 Ident.: DSC-22_20-20-60-00013736.0001001 / 18 MAR 11
Applicable to: MSN 11531

The FMS Landing System (FLS) function allows the flight crew to fly VOR, VOR/DME, NDB, NDB/DME, RNAV or LOC only approaches, in managed lateral and vertical modes, and with an ILS-look alike way. This only applies to approaches stored in the navigation database.
The FMS computes a final approach path, called the FLS beam, and sends it to the MMR.
The MMR then computes the deviations between the aircraft position and the FLS beam, and sends these deviations to the FG for guidance purpose.
The flight crew can use the FLS function to fly an ILS approach with glideslope out, or a LOC only approach. In this case, the FG uses the ILS LOC beam for lateral guidance, associated to the FLS F-G/S beam.

FLS BEAM COMPUTATION

Applicable to: MSN 11531

2 Ident.: DSC-22_20-20-60-A-00013743.0001001 / 29 MAY 13

GENERAL

The FMS computes a FLS beam when the flight crew:
- Inserts a VOR, VOR/DME, NDB, NDB/DME, RNAV or LOC only approach, or
- Inserts an ILS approach and deselects the glideslope

The FLS beam represents the final approach leg of the non-precision approach.

The FLS beam is defined by:
- An anchor point
- A course
- A slope.

The aircraft can capture the FLS beam up to 100 NM from the destination.

CAUTION	The FLS beam is a virtual beam of 100 NM and may interfere with terrain obstacles outside the published approach. The obstacle clearance outside the published approach is the responsibility of the flight crew.

The FMS does not compute the FLS beam:
- For IGS without G/S, SDF and LDA approaches, or
- If the angle between the course of the final approach leg and the runway course is more than 50 °.

In such cases, the FLS function is not available and the MCDU displays the message “NO FLS FOR THIS APPR”.

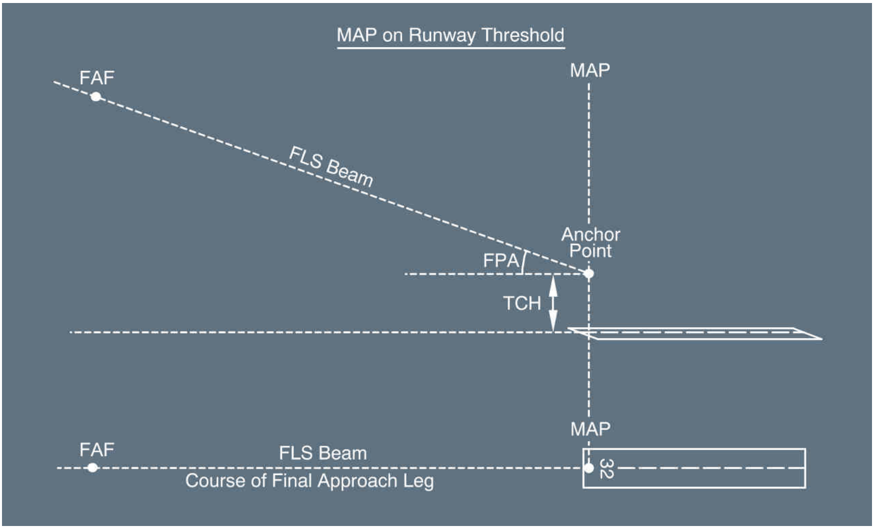
When FLS function is available and the flight crew presses the LS pb, the FMA displays the FLS capability and the FLS data. The FLS capability can be:
- F-APP, or
- F-APP + RAW, or
- RAW ONLY.

Note: *Prior to LS selection, the ECAM status info indicates any degradation of the FLS capability.*

The layout of the FLS beam is based on the relative position of the Missed Approach Point (MAP) to the runway threshold.

FLS BEAM COMPUTATION WHEN THE MAP IS ON THE RUNWAY THRESHOLD

When the MAP of the selected approach is defined on the runway threshold (+/- 0.14 NM):
- The anchor point is located on the runway threshold Crossing Height, TCH (or threshold height +50 ft if no threshold crossing height is stored in the database). The ident of the anchor point is RWYxxx, where xxx is the ident of the runway threshold (e.g. RWY33L)
- The course of the FLS beam in the course of the final approach leg
- The slope of the FLS beam is the Flight Path Angle (FPA), stored with the runway threshold in the navigation database.

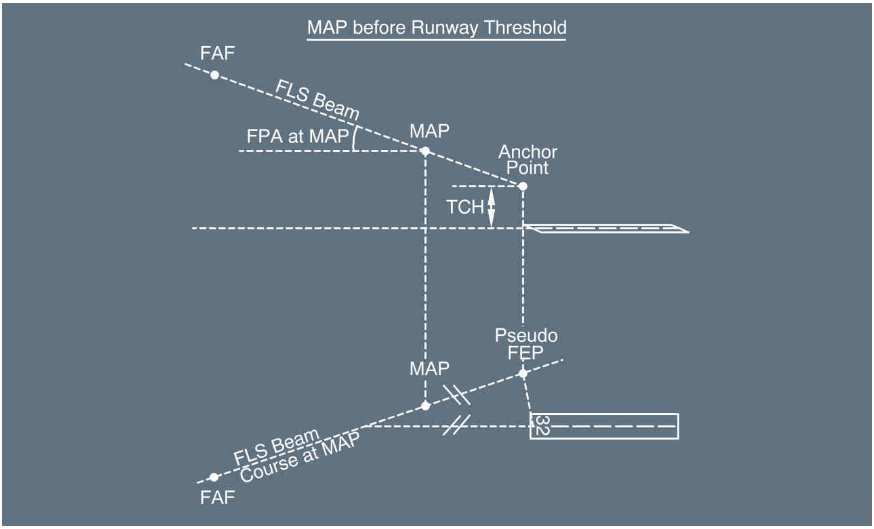


FLS BEAM COMPUTATION WHEN THE MAP IS BEFORE THE RUNWAY THRESHOLD

When the MAP of the selected approach is before the runway threshold:

- The anchor point is located on a pseudo final end point (that is computed by the FMS) at the Threshold Crossing Height, TCH (or threshold height +50 ft if no threshold crossing height is stored in the database).
  The ident of the anchor point is EPxxx, where EP stands for End Point, and xxx is the ident of the runway (e.g. EP33L).

  Note: *When the anchor point is closer than 0.1 NM to the runway threshold, the ident of the anchor point is RWYxxx.*
- The course of the FLS beam is the course that is stored with the MAP in the navigation database
- The slope of the FLS beam is the Flight Path Angle (FPA) stored with the MAP in the navigation database.



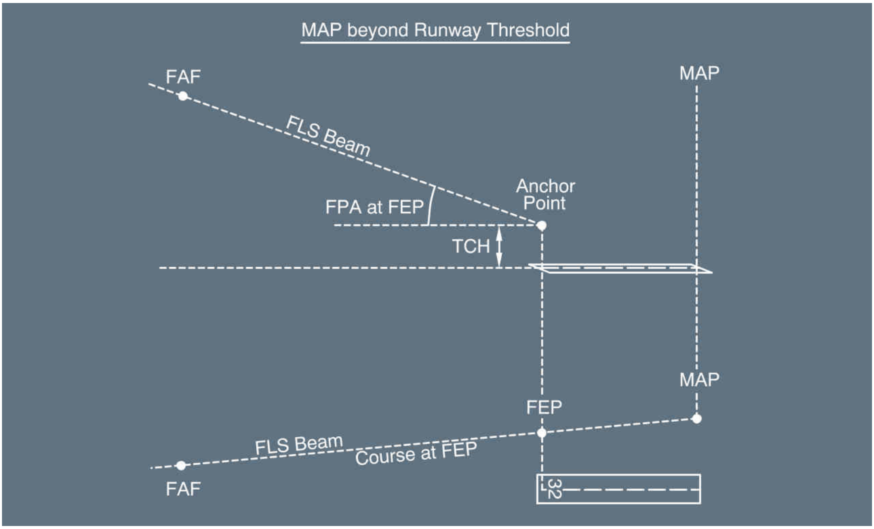
MAP before Runway Threshold
FAF
FLS Beam
FPA at MAP
MAP
Anchor Point
TCH
Pseudo FEP
MAP
32
FLS Beam Course at MAP
FAF

FLS BEAM COMPUTATION WHEN THE MAP IS BEYOND THE RUNWAY THRESHOLD

When the MAP of the selected approach is beyond the runway threshold:

- The anchor point is located on the final end point (that is stored in the navigation database) at the Threshold Crossing Height, TCH (or threshold height +50 ft if no threshold crossing height is stored in the database).
  The ident of the anchor point is the ident of the final en point (e.g. EP33L).

  Note: *When the anchor point is closer than 0.1 NM to the runway threshold, the ident of the anchor point is RWYxxx.*
- The course of the FLS beam is the course that is stored with the final end point in the navigation database
- The slope of the FLS beam is the Flight Path Angle (FPA) stored with the final end point in the navigation database.



3 Ident.: DSC-22_20-20-60-A-00013744.0001001 / 18 MAR 11

BARO CORRECTION OF THE FLS VERTICAL DEVIATION

When the baro setting is STD:

- The computation of the FLS beam and of the F-G/S deviation is based on the QNH that the flight crew entered on the PERF APPR page.
- FMS uses 1 013 hPa if the flight crew did not enter any value on the PERF APPR page. However, in such cases, no F-G/S deviation is computed.
  When the baro setting is QNH, the computation of the FLS beam and of the F-G/S deviation is based on the current QNH.

4 Ident.: DSC-22_20-20-60-A-00013745.0001001 / 18 MAR 11

COLD WEATHER CORRECTION OF THE FLS BEAM

When the temperature at destination (on the PERF APPR page) is below the ISA temperature, the computation of the FLS beam and of the F-G/S deviation is corrected with the entered temperature. If the flight crew did not enter any temperature, the FMS takes into account the ISA temperature.

Intentionally left blank

FLIGHT PLANNING

Ident.: DSC-22_20-30-05-00010492.0002001 / 17 AUG 10
Applicable to: ALL

The flight crew uses the MCDU to insert flight plans into the FMGS:
- A lateral flight plan that defines the intended horizontal flight path
- A vertical flight plan that defines the intended speed and altitude profile for the aircraft to follow while flying the lateral flight plan.

Note: *The flight planning function is available for both the primary and secondary flight plans.*

The FMGS can contain two different flight plans:
- The ACTIVE flight plan, which is the basis for:
  - Lateral and vertical guidance
  - MCDU and ND display
  - Radio navigation autotuning
  - Performance predictions
  - Fuel planning.
- The SECONDARY flight plan which the flight crew may use:
  - When an alternate takeoff runway is probable
  - To plan a diversion
  - To prepare the next flight
  - To compare predictions or evaluations.

Each flight plan is composed of the same elements:
- The primary flight plan, from origin to destination and missed approach
- The alternate flight plan, from destination to alternate destination.

The flight crew enters the flight plan in either of two ways:
- Automatically by selecting a company route. Such a selection will call all the elements of the route out of the database.
- Manually by selecting an ORIGIN/DEST pair, and then selecting all successive waypoints, procedures, and vertical constraints on the MCDU.

The flight crew may then modify the flight plan on the ground or in flight, by making lateral and vertical revisions.

General

GENERAL

Ident.: DSC-22_20-30-10-05-00011075.0005001 / 25 MAY 21
1 **Applicable to: MSN 10949-11597**

To insert the lateral flight plan, the flight crew can use either a company route number or an ICAO four-letter city pair.

The lateral flight plan includes the following elements:
- Departure
  - Takeoff runway
  - SID
  - En route transition.
- En route
  - En route waypoints and airways.
- Arrival
  - En route transition
  - STARs/VIAs
  - Landing runway with selected approach
  - Missed approach.
- Alternate flight plan.

These elements are defined by waypoints and legs between the waypoints.

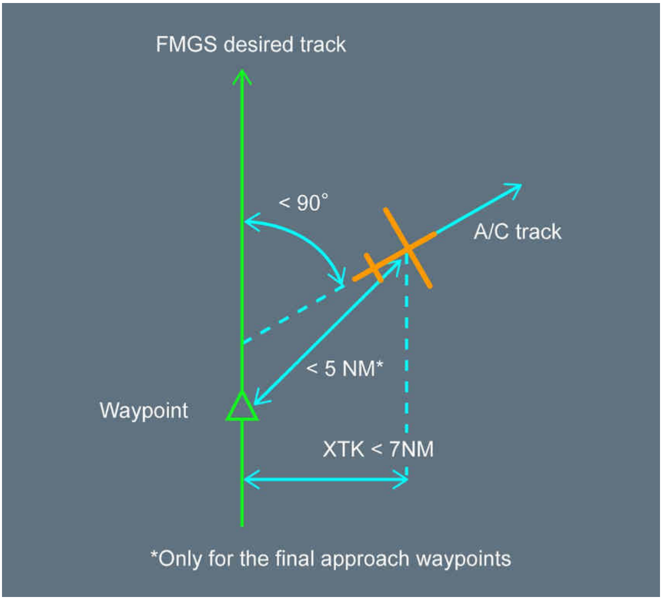
The FMGC strings the legs in sequence automatically.
The flight plan has a discontinuity if any two waypoints do not have a leg defined between them.
The computer assumes that the aircraft will fly a direct leg between the two waypoints that define the discontinuity.

Note: *When the aircraft enters a flight plan discontinuity, the NAV mode automatically switches to the HDG/TRK mode.*

In HDG/TRK mode, a flight plan waypoint is sequenced if the following conditions are met:
- The waypoint is behind the aircraft
- The cross track is less than 7 NM
- The angle between the current aircraft track and the track of the leg is less than 90 °.

Note: *If the waypoint is part of the final approach procedure, the waypoint is sequenced if all above conditions are met and the direct distance to the waypoint is less than 5 NM.*

The same conditions apply in NAV mode, except that no distance to the waypoint is taken into account.



Note: *If the flight crew revises the lateral flight plan with the DIR TO INTERCEPT function, the waypoints of the revised flight plan are sequenced when the aircraft is in the above mentioned conditions.*

The FMGS automatically strings additional types of legs, when departure or arrival procedures (SID - STAR - TRANS) are defined.

Those strings correspond to specific patterns that are heading or track referenced and are defined in the database, such as:
- DME arc leg
- Holding pattern to a fix, or reverse turn

- Course-to-fix leg
- Radius-to-fix leg
- Heading leg
- MANUAL leg.

The flight crew cannot create these types of legs: they are part of the stored departure/arrival procedures they have selected.
The flight crew can only create direct legs between manually defined geographic points (navaids, airports, waypoints).

Note: *The departure and arrival procedures are defined in the database to minimize the amount of memory required.*

They are divided as follows:
- *DEPARTURE = SID + EN ROUTE TRANSITION*
- *ARRIVAL = APPR VIA + STAR + EN ROUTE TRANSITION*

The SID is the central common part of the departure procedure, as the STAR is for the arrival procedure. En route transitions are the various possible trajectories defined between the last point of the SID and the first en route waypoints, and between the last en route waypoint and the first fix of the STAR. "APPR VIAs" are the possible trajectories, defined between the last STAR point and the first point of the approach.

MANUAL LEGS

Ident.: DSC-22_20-30-10-05-00010629.0001001 / 17 AUG 10
Applicable to: ALL

A MANUAL leg stays on a constant TRK or HDG and has no termination point. The flight crew cannot insert it into a flight plan manually: it is part of a given procedure such as a SID or a STAR. When the aircraft is flying a MANUAL leg, the NAV mode remains engaged and predictions assume that the aircraft will fly a direct leg from its present position to the next waypoint (DIR TO). When the aircraft is cleared to fly to the next waypoint of the flight plan, the flight crew performs a DIR TO.

Note: *1. In NAV mode, a MANUAL leg is sequenced only by performing a DIR TO.*
2. The use of the descent mode (DES) on a MANUAL leg is not recommended.

FLIGHT PLAN CAPACITY

Ident.: DSC-22_20-30-10-05-00010631.0009001 / 30 AUG 18

3 **Applicable to: MSN 10949-11597**

In terms of flight plan capacity, the FMS takes into account all the following flight plans:
- The active flight plan
- The secondary flight plan
- The temporary flight plan.

Each flight plan can contain up to 250 legs. If a flight plan contains 250 legs, and if the flight crew attempts to perform a lateral revision that increases the number of legs of this flight plan, the FMS rejects the revision and the MCDU displays the “F-PLN FULL” message. For the active and secondary flight plans, the primary parts must contain less than 215 legs, and the alternate parts must contain less than 35 legs.

FLIGHT PLAN CAPACITY

Ident.: DSC-22_20-30-10-05-00010631.0002001 / 04 NOV 20
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

In terms of flight plan capacity, the FMS takes into account 3 flight plans:
- The active flight plan
- The secondary flight plan
- The temporary flight plan.

Each flight plan can contain up to 200 legs. If a flight plan contains 200 legs, and if the flight crew attempts to perform a lateral revision that increases the number of legs of this flight plan, the FMS rejects the revision and the MCDU displays the F-PLN FULL message.
For the active and secondary flight plans, the primary parts must contain less than 165 legs, and the alternate parts must contain less than 35 legs.

FLIGHT PLAN CAPACITY

Ident.: DSC-22_20-30-10-05-00010631.0008001 / 17 AUG 10
Applicable to: MSN 04827-04860

In terms of flight plan capacity, the FMS takes into account 5 elements:
- The primary part of the active flight plan
- The alternate part of the active flight plan
- The primary part of the secondary flight plan
- The alternate part of the secondary flight plan
- The temporary flight plan.

Each element can contain up to 200 legs. If an element contains 200 legs, and if the flight crew attempts to perform a lateral revision that increases the number of legs of this element, the FMS rejects the revision and the MCDU displays the “F-PLN FULL” message.

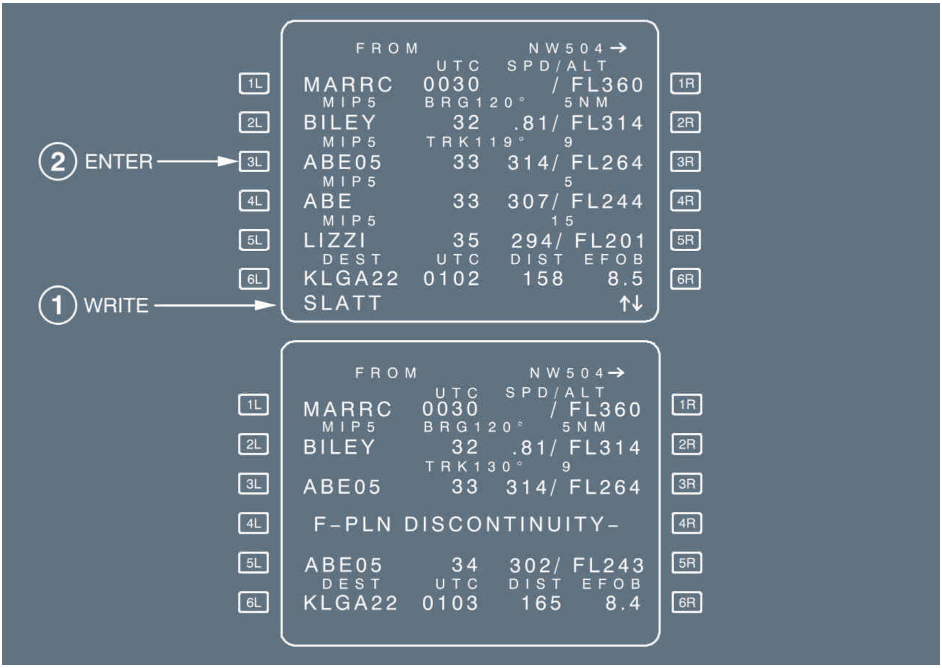
LATERAL REVISIONS

Ident.: DSC-22_20-30-10-05-00010632.0002001 / 07 APR 17

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The flight crew can revise the lateral flight plan following two types of revisions:

1. Lateral revisions that have an immediate effect on the active flight plan:
   - The flight crew inserts a new waypoint directly on the F-PLN page, deletes, or changes a waypoint from it:



```

```

   When the flight crew enters a new waypoint, which does not exist in the flight plan, the following waypoint moves down the flight plan, with a discontinuity shown after the new waypoint.
   - The flight crew adds a direct leg (DIR TO) from his present position to a selected waypoint: The flight crew can change the “TO” waypoint of the active leg. The DIR TO function gives access to DIR TO, DIR TO ABEAM, or DIR TO/INTERCEPT. The active leg then goes from the present position (T/P) to the waypoint selected or inserted as the new “TO” waypoint.

2. Lateral revisions that lead to a temporary flight plan (TMPY) before they take effect:
   The flight crew creates a temporary flight plan, then inserts it as a revision to the active flight plan. The flight crew does this when selecting, deleting, or modifying several waypoints of an airway or procedure at once (SID, STAR, HOLD, TAKEOFF or LANDING RWY). This modification is made on specific "LAT REV" pages from the flight plan page.

Possible revisions are:
- Insert or modify the departure procedure
- Insert or modify the arrival procedure
- Insert a waypoint
- Change the destination
- Insert an airway
- Insert an offset
- Insert a holding pattern
- Select or enable an alternate flight plan
- Fix information.

The purpose of the temporary flight plan is to allow the flight crew to check a revision on the MCDU and on the ND before inserting the changes into the active flight plan. It is a copy of the active flight plan that has been changed according to the flight crew revision. While it is displayed, the aircraft will continue to follow the original active flight plan.
No predictions are computed or displayed on the pages of the temporary flight plan.

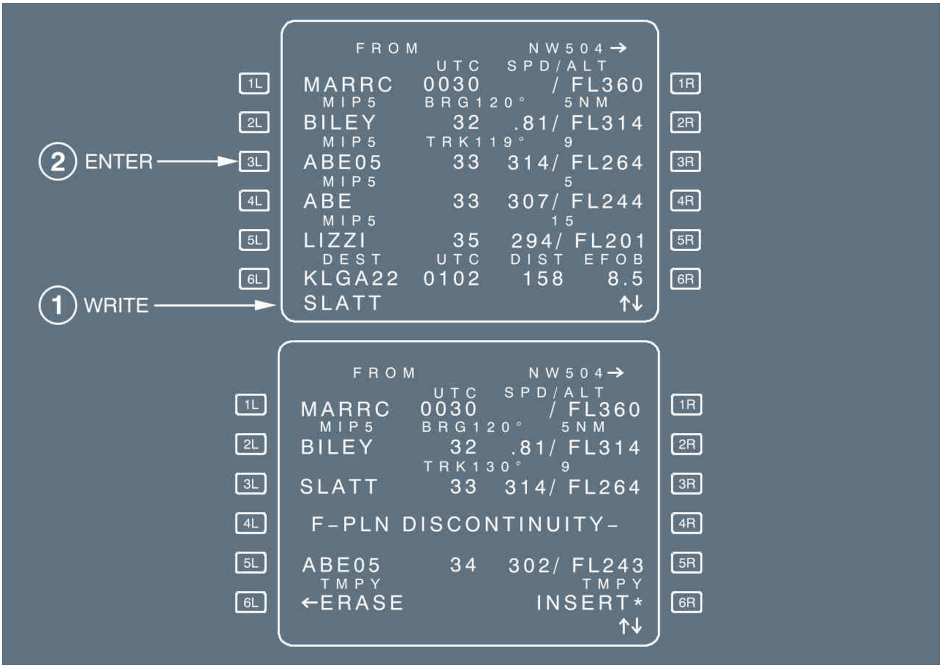
LATERAL REVISIONS

Ident.: DSC-22_20-30-10-05-00010632.0005001 / 23 JUN 15
Applicable to: MSN 04827-04860

The flight crew can revise the lateral flight plan in three ways. All lateral revisions of the F-PLN lead the FMS to create a temporary flight plan (TMPY) before they take effect:

- The flight crew inserts a new waypoint directly on the F-PLN page, deletes, or changes a waypoint from it:



```
  FROM                  NW504→
           UTC     SPD/ALT
MARRC     0030        / FL360

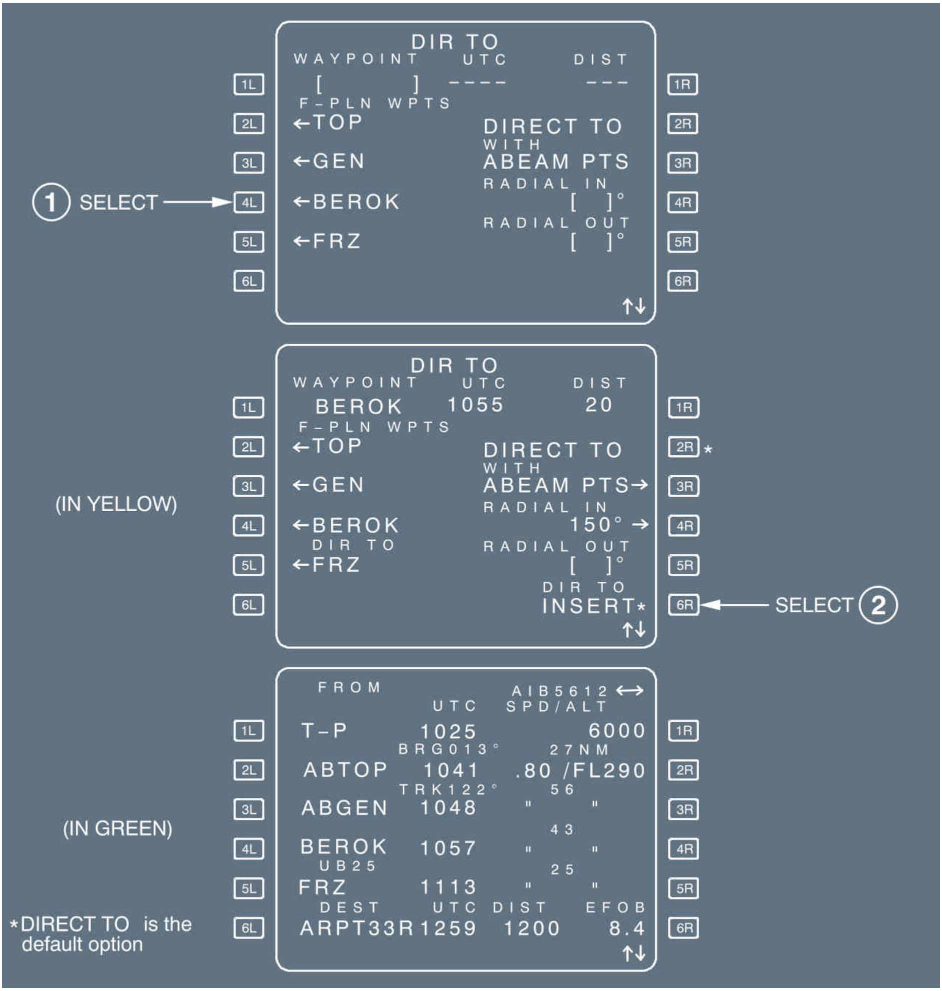
   F-PLN DISCONTINUITY-
ABE05       34     302/ FL243
  TMPY                  TMPY
←ERASE               INSERT*
                            ↑↓
```

- After inserting a waypoint, a F-PLN discontinuity is inserted between the inserted waypoint and the following one.
- After deleting a waypoint, a F-PLN discontinuity is inserted between the preceding waypoint and the following one.

The flight crew should clear the discontinuity as appropriate, check the temporary F-PLN and insert it in the active F-PLN.

- The flight crew adds a direct leg (DIR TO):



```
           DIR TO
WAYPOINT     UTC          DIST

```

*DIRECT TO is the default option

The flight crew can perform a “DIR TO” to a waypoint in the F-PLN. Different options may be used to perform a “DIR TO”: DIRECT TO, DIR TO WITH ABEAM POINTS, RADIAL IN, RADIAL OUT. A single revision DIR TO temporary F-PLN specific to the DIR TO action is automatically created when the waypoint has been selected. After inserting the “DIR TO”, the active leg goes from present position (T/P) to the selected waypoint.

- The flight crew uses the LAT REV function. Possible revisions are:
  - Insert or modify the departure procedure
  - Insert or modify the arrival procedure
  - Insert a waypoint
  - Change the destination
  - Insert an airway
  - Insert an offset
  - Insert a holding pattern
  - Select or enable an alternate flight plan
  - Radial fix information
  - Insert LAT/LONG crosssing waypoint.

  The purpose of the temporary flight plan is to allow the flight crew to check a revision on the MCDU and on the ND before inserting the changes into the active flight plan. It is a copy of the active flight plan that has been changed according to the flight crew revision. While it is displayed, the aircraft will continue to follow the original active flight plan.

  Predictions are computed or displayed on the pages of the temporary flight plan.

FMS2 HONEYWELL

GENERAL

Ident.: DSC-22_20-30-10-15-00005067.0001001 / 26 OCT 22

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The lateral revision function allows the flight crew to create or modify the following parts of the flight plan:

- Airway
- Waypoint
- New destination
- Holding pattern
- Offset
- Alternate
- Fix information
  Each time the flight crew activates one of the above-listed revisions, the flight crew accesses a temporary flight plan that enables the modification to be checked before inserting it in the active flight plan. The flight crew selects these functions by pressing the left keys on F-PLN A or B.
- Direct to and overfly functions are accessed via the MCDU keys. No temporary flight plan is created with these functions.
- “Update at” capability is a specific function that manually updates the FM position. It does not use a temporary flight plan, but the flight crew must confirm its insertion before it is activated.

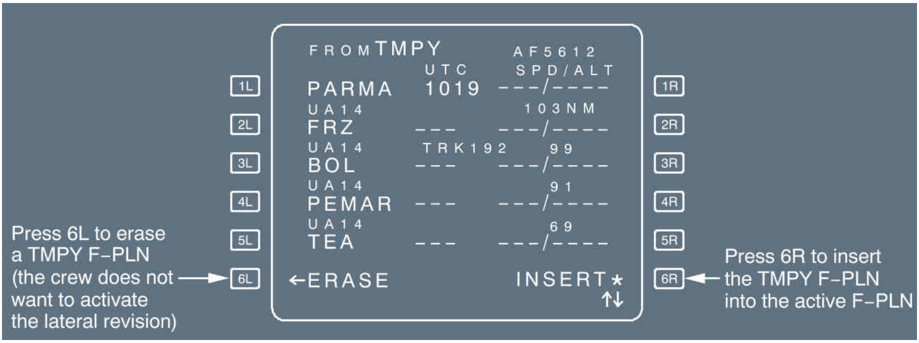
TEMPORARY F-PLN (TMPY)

Ident.: DSC-22_20-30-10-15-00000460.0001001 / 01 OCT 12

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

When a pilot makes a lateral revision to the F-PLN, the FMGS creates a temporary flight plan. This is a copy of the active F-PLN, but is corrected by the lateral revision in progress.
The aircraft continues to follow the active F-PLN, until the temporary revision is inserted.
The revision appears in yellow font on both MCDUs and NDs.

- Lateral and vertical revisions cannot be made to a temporary F-PLN.
- Only one temporary F-PLN may be accessed at a time.
- The “DIRECT TO” function, when used, erases a temporary F-PLN.
- When a DIR TO is in process, a temporary revision cannot be displayed on the other MCDU.
- A TMPY F-PLN changes the title of the flight plan pages. (TMPY appears in all titles).
- No predictions are computed for a temporary flight plan (dashes are displayed).



```
FROM TMPY           AF5612
         UTC        SPD/ALT

WRITE the second airway in the scratchpad (here UB25).
PRESS [2L] to insert it into the VIA field.

The system automatically determines the first downpath intersection point between the 2 airways.
- If the airways have a common waypoint, the system selects it as the ending point of the first VIA.
- If they have no common waypoint, but have a single intersection, the system creates this intersection as an FM-computed point and displays X followed by the airway IDENT (here XUB25).
- If they have no common waypoint or intersection, the system displays NO INTERSECTION FOUND in the scratchpad.

Once the flight crew has entered the required airways (up to 5), the flight crew must enter the ending point of the last selected airways:

FLIGHT PLAN INSERTION

The flight crew either inserts the flight plan directly from the AIRWAYS page, or from the TMPY F-PLN page. In both cases:

PRESS [6R] to insert the temporary flight plan. Clear flight plan discontinuity, as needed.

INSERTING A WAYPOINT

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_20-30-10-15-F-00012832.0001001 / 09 FEB 11

7

GENERAL

Waypoints can be inserted in two ways:
- Directly into the flight plan. All modifications go directly into the active flight plan. No temporary flight plan is created.
- By means of a lateral revision at the “NEXT WAYPOINT”, a process that creates a temporary flight plan.

The second method enables the temporary flight plan to be checked before it is inserted.

Ident.: DSC-22_20-30-10-15-F-00012833.0001001 / 09 FEB 11

8

WAYPOINT IDENTIFICATION

The pilot can identify a waypoint by:
- Its identifier (if it is in the navigation database).
- A Latitude/Longitude (LL).
- A Place/Bearing/Distance (PBD). The waypoint is defined by its bearing and distance from a place.
- A Place-Bearing/Place-Bearing (PBX). The waypoint is defined by the interception of 2 radials from 2 places.
- A Place/Distance (PD). The waypoint is defined by a distance from a place, along the F-PLN.

Note: *If a slash or a dash is not entered properly, the MCDU displays a “FORMAT ERROR” message.*

When the Flight Management Guidance System receives a waypoint that is not in the database, it identifies it as LLxx or PBD xx or PBX xx or PD xx (xx is a two-digit number between 01 and 20) and stores it in the stored waypoints file of the database.

<u>Note:</u> *When NAV mode is engaged, the crew cannot modify the "TO" waypoint (active leg) using the waypoint insertion function. If the crew wants to modify it, the DIR TO function will be used.*

WRITE the waypoint identifier or LAT/LONG, Place/Bearing/Distance or Place-Bearing/Place-Bearing into the scratchpad. (Example: Place: LMG, Bearing: 330 °, Distance: 135 NM).
PRESS the appropriate key to enter the waypoint into the flight plan. The rule is that the new waypoint appears next to the pressed key, and the previous waypoint moves down the flight plan path.

This operation creates a discontinuity between the new waypoint and the previous one.
The new flight plan will have to be cleared of the discontinuity and some waypoints erased.

WRITE the waypoint identifier and distance from this place.

According to the sign of the distance, the crew may define an along track waypoint before or after the revised place. (Example: AMB/-040).

PRESS the appropriate key adjacent to the place identifier. The system automatically positions the waypoint in the flight plan.

This operation does not create any discontinuity.
The system does not accept an along track waypoint entered at the FROM waypoint.

WRITE the latitude (NXX, XXN, SXX or XXS), the required increment in degrees between the successive waypoints, and the number of required waypoints.

(Example: The pilot wants to obtain 3 points, every degree from latitude N46: He enters N46/1/3).

PRESS [2R] to insert it into the LL XING/INCR/NO field.
PRESS [6R] to insert the new waypoints in the flight plan without discontinuity.

The system does not store these waypoints in the database.

FIX INFO

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_20-30-10-15-G-00012838.0008001 / 09 FEB 11

13

GENERAL

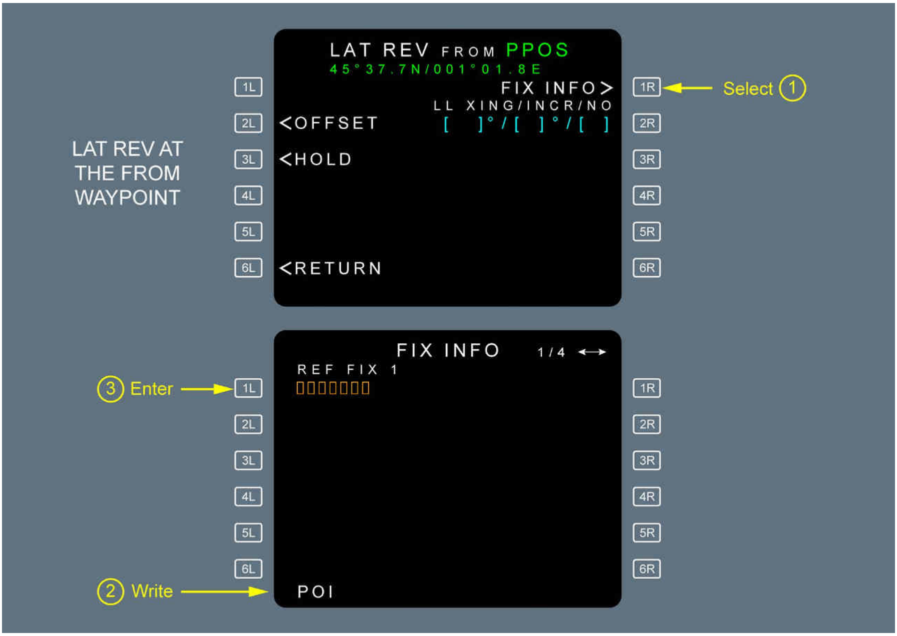
When using the FIX INFO function, the flight crew defines waypoint intersections of the flight plan with radials, circle or abeam associated to a fix.
When the flight crew inserts the intersection points, the system automatically identifies these points, but does not store them in the navigation database.

Ident.: DSC-22_20-30-10-15-G-00012839.0008001 / 10 MAY 21

14

INSERTING A RADIAL INTERCEPT WAYPOINT

The flight crew accesses the radial intercept function from the lateral revision page at the origin or “from” waypoint.



LAT REV AT THE FROM WAYPOINT

```
        LAT REV FROM PPOS
        45°37.7N/001°01.8E
                       FIX INFO>

SELECT FIX INFO in [1R].
WRITE the reference fix IDENT into the scratchpad (for example, POI), and ENTER in [1L].

Note: *It may be any database or pilot-defined fix.*

WRITE the radial into the scratchpad (for example, 120 °) and ENTER in [2L].

Note:
- *The defined radial appears as a blue dashed line on the ND*
- *If the radial line intersects the active flight plan, an asterisk is displayed next to the entered radial and degree sign. The system computes the time, distance to go, and the altitude at the intersection point*
- *Up to two radials can be entered.*

SELECT in [2L] or [3L] the required radial to insert the associated waypoint into the flight plan.
When a radial has been inserted into the flight plan, an additional radial from the selected waypoint can be inserted as well in the flight plan.

Note: *The system automatically assigns its IDENT as the three first characters of the reference fix IDENT, followed by the radial (for example, ABC 140). The blue dashed line disappears from the ND.*

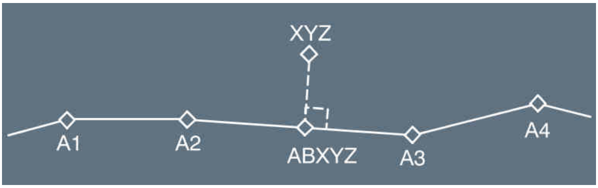
ABEAM INTCPT POINT IS COMPUTED AND INSERTABLE

WRITE the reference fix identifier into the scratchpad (here POI), and ENTER it [1L]
SELECT the ABEAM prompt [5L]:

A blue dashed line from the reference fix and perpendicular to the flight plan appears on the ND. The system computes the radial, time, distance to go, altitude and predictions related to the waypoint abeam the reference fix.

SELECT [5L] to insert the abeam intercept waypoint into the flight plan (if needed):

The system automatically assigns its identifier as AB, followed by the first five characters of the reference fix identifier (Example ABXYZ). The blue dashed line disappears from the ND.



INSERTING A NEW DESTINATION

Ident.: DSC-22_20-30-10-15-00000471.0001001 / 14 MAY 12

17 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The pilot may define a new destination and insert it via the lateral revision page. The pilot may then call up the new destination from any waypoint along the flight plan, except the FROM waypoint, the destination, and the missed-approach waypoint. When the new destination has been inserted, a flight plan discontinuity appears between the revision waypoint and the new destination. All waypoints beyond the revision waypoint (including the previous destination and associated missed approach) are deleted.

SELECT the lateral revision function at an appropriate waypoint.
WRITE the new destination in the scratchpad.
Enter it in the brackets under “NEW DEST”.
INSERT the temporary flight plan ([6R] key), and complete the flight plan to the new destination.

HOLDING PATTERN

Ident.: DSC-22_20-30-10-15-A-00007222.0001001 / 09 FEB 11

18 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

GENERAL

This section describes holding patterns, associated guidance and flight crew procedures.
The Flight Management and Guidance Computer (FMGC) has three types of holding patterns that the pilot can use in a flight plan.

Ident.: DSC-22_20-30-10-15-A-00007163.0001001 / 01 OCT 12

19 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

HOLD TO FIX (HF)

The holding pattern is always part of an arrival or departure procedure. The aircraft flies it once and then automatically exits the holding pattern at the fix. The predicted speed in the holding pattern is the lowest of the ICAO speed limit, max endurance speed, or any speed constraint. Guidance to the fix in the holding pattern is similar to that on any leg of a flight plan. The HF patterns are part of the navigation database and cannot be created by the crew.

HOLD TO ALTITUDE (HA)

The aircraft flies the hold until it reaches the specified altitude. Then, it automatically exits the hold at the fix.
The predicted speed for the holding pattern is the lowest of the ICAO speed limits, the max endurance speed, or any speed constraint.
The size of the holding pattern is a function of the predicted speed.
Guidance in a hold to altitude (HA) is similar to that for any leg of a flight plan.
The HAs are in the navigation database, as part of the arrival or departure procedures, and cannot be created by the crew.

HOLD TO ALTITUDE AT LFBO
(DEPARTURE PROCEDURE)

HOLD WITH MANUAL TERMINATION (HM)

This type of holding pattern may be part of an arrival procedure, or the flight crew may enter it at the present position or at any flight plan waypoint.
The flight crew will use this type of holding pattern to comply with a defined procedure or a clearance limit, or to meet an operational need (such as losing altitude, holding for weather improvement, or absorbing an ATC delay).
This type of holding pattern is exited according to the flight crew's decision, not automatically.
There are 3 types of HMs, and all are modifiable.

DATABASE HOLD

PREDICTIONS AND GUIDANCE ASSOCIATED WITH A HM HOLDING PATTERN (HOLD WITH MANUAL TERMINATION)

Before Deceleration

If an altitude constraint is defined at the hold entry fix, then the FMS duplicates this constraint on the hold exit.
However, different constraints may be inserted at entry and exit fixes.
Although the hold is inserted in the flight plan, the FMS does not take it into account for predictions until the aircraft enters the hold.
However, if the hold is not deleted by the flight crew, the FMS schedules a deceleration point and displays it on the ND.

The FMS predicts the estimated time and amount of fuel remaining at which the aircraft must exit holding, so as to comply with the fuel policy specified on the FUEL PRED page.
When the aircraft enters the holding pattern, the FMS revises all predictions and assumes the aircraft will fly one turn of the holding pattern.

Each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding circuit.

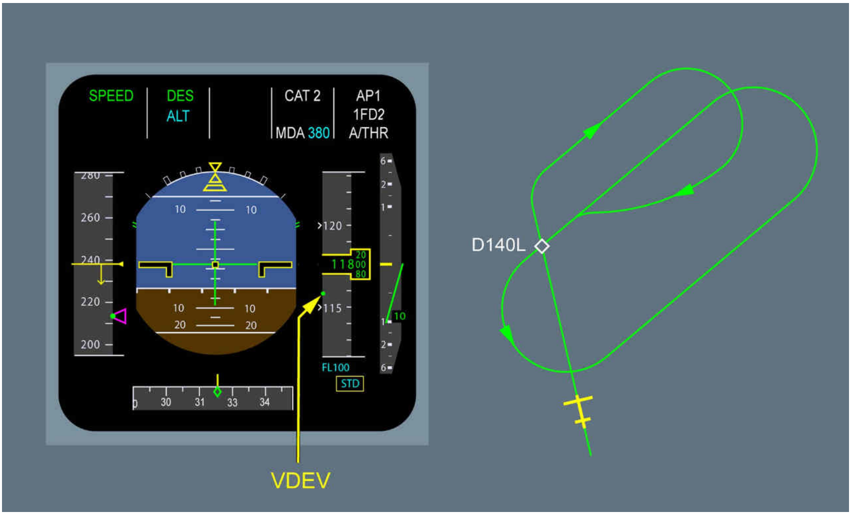
Upon Reaching the Speed Change Pseudo Waypoint

The FMS either causes the aircraft to decelerate to the hold speed (if managed speed is active and NAV mode engaged), or display SET HOLD SPEED on the MCDU and SET HOLD SPEED on the PFD, if the flight crew selected a speed target.

The default hold speed is the lowest of the following:
- Maximum endurance speed
- ICAO limit holding speed
- Speed constraint (if any).

When no specific speed limit applies, the default hold speed is approximately equal to the following:
- Green Dot speed on the A318, A319, A320 (CFM or PW) and A321, or
- Green Dot +20 kt for altitude lower than 20 000 ft, on the A320 (IAE), or
- Green Dot +5 kt for altitude higher than 20 000 ft, on the A320 (IAE).

The flight plan predictions for time and fuel do not yet consider that the hold will be flown. However, the ND shows the hold entry and holding pattern trajectory.



Deceleration receives priority, so that when in DES mode, the aircraft will deviate above the descent path to decelerate. (VDEV becomes positive on the PROG page).
The F-PLN displays IMM EXIT prompt.

If the flight crew presses the key next to IMM EXIT, before arriving at the holding fix, the aircraft will not enter the holding pattern, but will resume its applicable manage speed of the current flight phase.

                             ↑↓
```

<u>After Reaching the Hold Entry Fix</u>

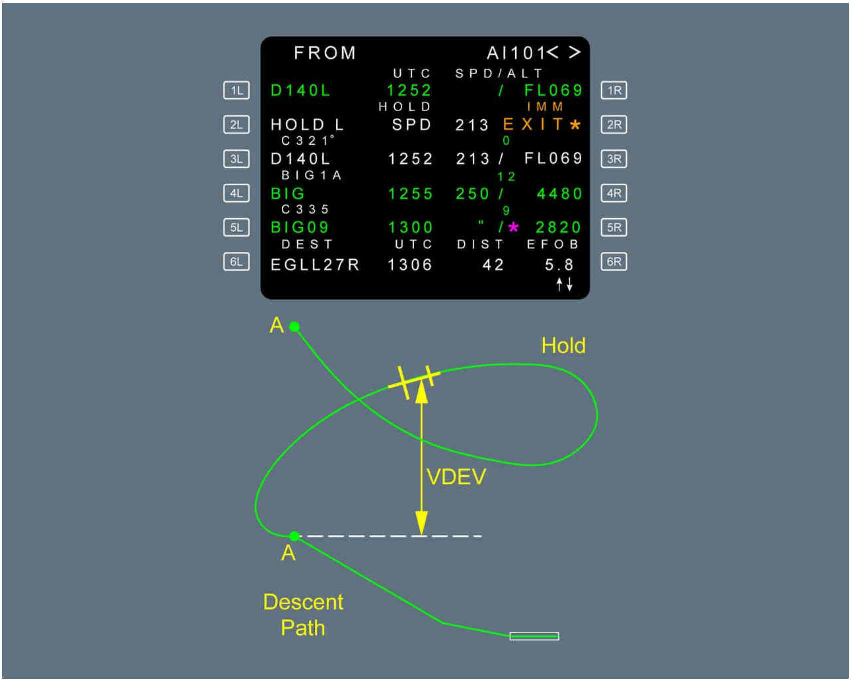
The aircraft enters the hold. The HOLD page displays the associated holding data:

- The inbound course (INB CRS)
- The TURN direction (L or R)
- The TIME/DIST
- The LAST EXIT time and the associated fuel to reach the alternate airport with no extra fuel.

The FMS assumes that the aircraft will fly one turn of the holding pattern, and revises the predictions accordingly.

When the holding pattern is defined by a leg time (and not a leg distance), the FMS revises the size of the hold as a function of the target speed:

- If managed speed is active, the FMS uses the predicted holding speed to calculate the size of the holding pattern
- If the selected speed is active, the FMS uses the target speed selected by the flight crew at the entry fix sequencing to calculate the size of the holding pattern
- The VDEV displayed on the PFD and the PROG page, when the aircraft is flying in the HM is the difference between the aircraft’s current altitude and the altitude at which it should be when it reaches the hold exit fix in order to be correctly positioned on the descent path.



```

```

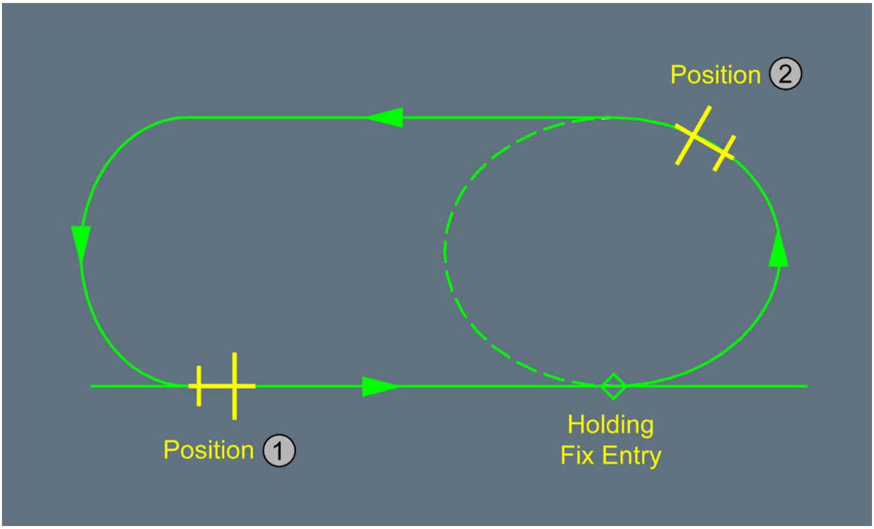
HOLD EXIT PROCEDURE



At position (1), If the flight crew selects IMM EXIT, the aircraft will exit at the next fix overfly.
At position (2), If the flight crew selects IMM EXIT, the aircraft will make an immediate turn to the fix where the hold will be exited.

If managed speed is active, the FMS sets the target speed to the applicable speed of the current phase (for example, speed constraint, ECON speed, or speed limit).
The FMS then assumes that the flight crew will continue on the descent path, if the aircraft is in descent.

If DES mode is engaged, the following applies:
- The holding pattern is never included in the descent path computation
- The flight crew cannot enter altitude and speed constraints at the hold exit fix (this is only allowed at the hold entry fix)
- The vertical guidance in the HM, during the descent phase, is set to -1 000 ft/min but the FMS considers altitude constraints that will take effect farther down the flight path. The FMS will not allow the aircraft to descend below the next altitude constraint, neither to the FCU selected altitude. If the aircraft reaches the next altitude constraint, it will level off and the ALT CST mode will engage.

With RESUME HOLD Pressed

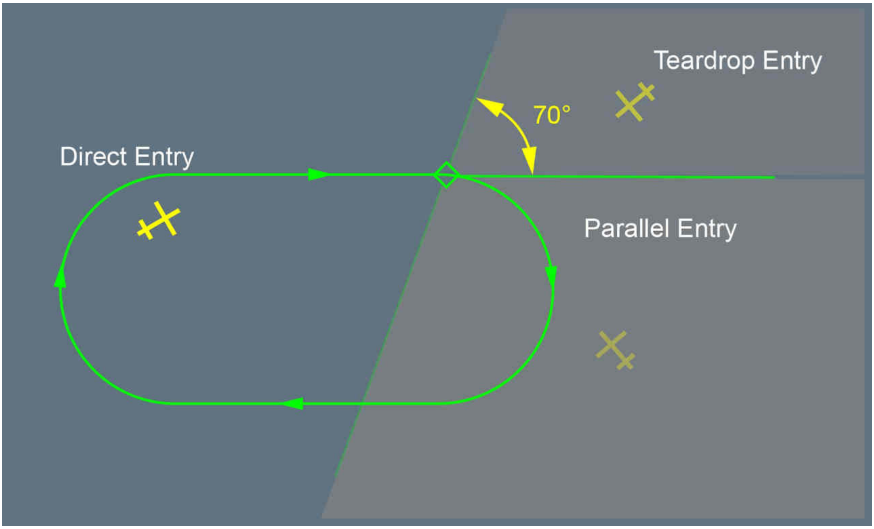
If the flight crew presses the key next to RESUME HOLD, the aircraft remains in the holding pattern, and IMM EXIT is displayed again.

After that, each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding circuit.

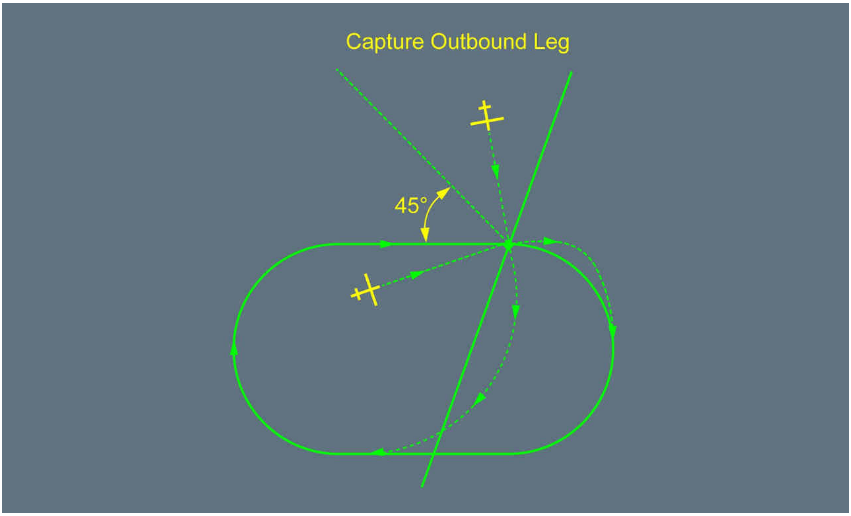
HOLDING PATTERN ENTRIES

The FMS offers three types of entry into holding patterns:

1. Direct entry
2. Teardrop entry
3. Parallel entry.

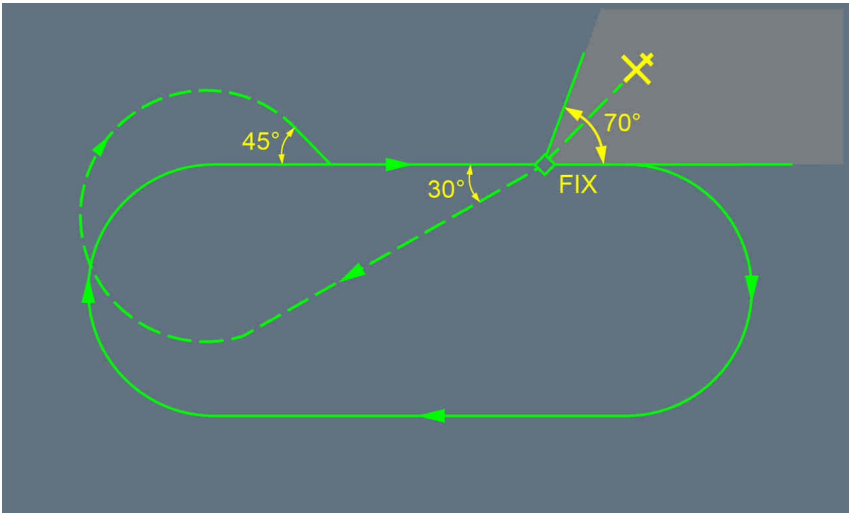


1. Direct entry

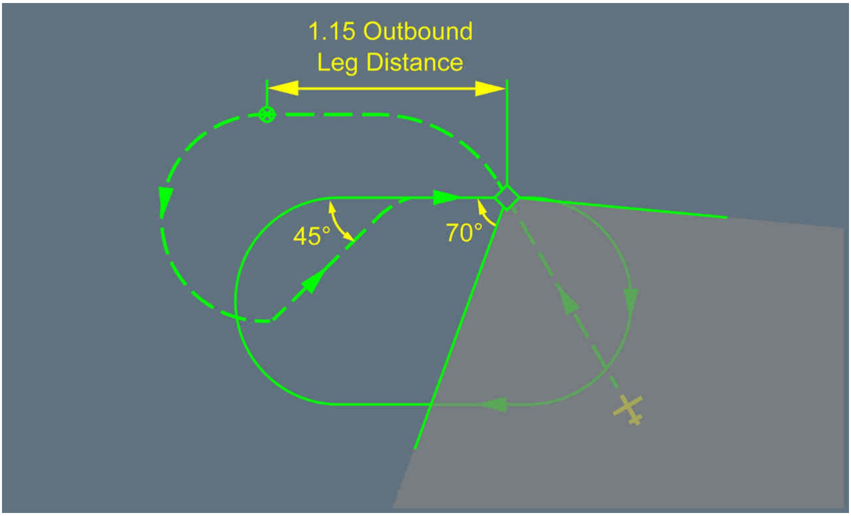


Capture Outbound Leg
45°

2. Teardrop entry



3. Parallel entry



1.15 Outbound
Leg Distance
45°
70°

Note: *If the leg the aircraft is flying toward the holding fix is on a "limit" between a teardrop entry and a parallel entry, the FMS may compute and display either of the two entries. The flight crew should keep this in mind, and should not assume that the FMS is malfunctioning.*
If the flight plan leg toward the hold entry fix is on a course that is the reciprocal of the inbound course of the holding pattern, the aircraft will fly a parallel entry.

GENERAL

Offset allows the flight crew to define on offset of the active flight plan. The offset can be immediate or deferred to start on a downstream leg. The offset will end by default or at a pre-planned end waypoint. Additionally, the flight crew can specify the intercept angle used for the transitions to and from the offset path.
In most cases, the pilot will use it enroute because of an ATC clearance, or to avoid bad weather expected along the flight plan route.
This page is accessed from LAT REV page at the FROM waypoint or at any waypoint downpath the flight plan, except the destination airport.
After inserting the offset in the flight plan, the flight plan page shows OFST in its title, left or right arrows are displayed on every label line between the start and end waypoints of the offset, and the navigation display shows the offset flight plan with a solid green line and the original flight plan with a dashed green line.

The offset is cleared:
- Automatically (holding pattern, approach), or
- Manually with the clear (CLR) key, or by entering “o” in the offset value field [1L] or by using the delete prompt in the OFFSET page.

Note: *If the pilot enters an OFFSET when the aircraft is too close to the TO waypoint, the FMGS may refuse to accept it, in which case the MCDU displays the “ENTRY OUT OF RANGE” message.*

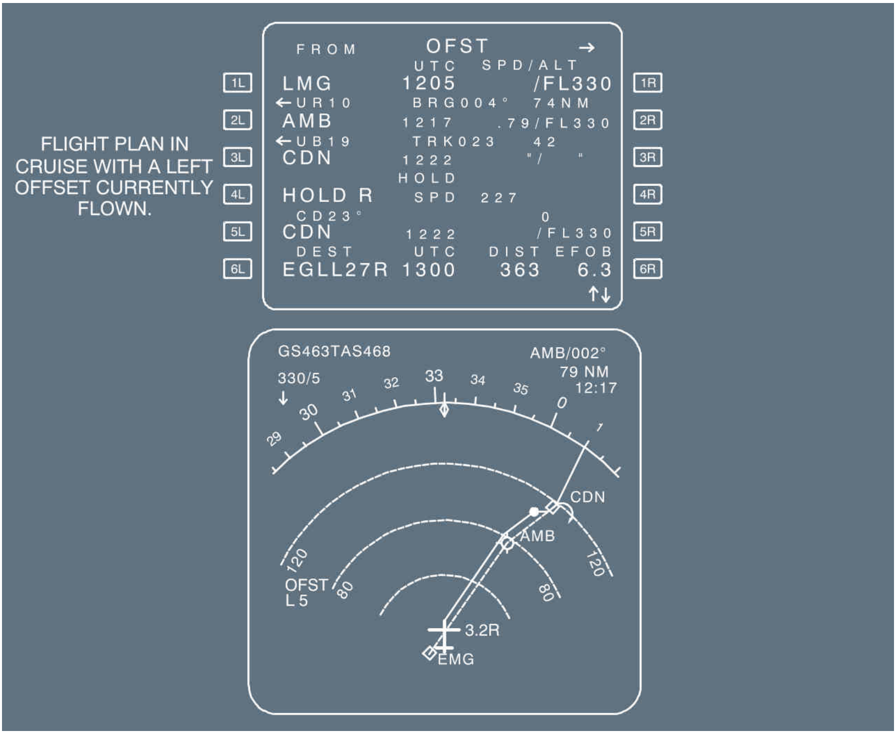
INSERTING AN OFFSET

SELECT LAT REV page at a waypoint.
SELECT OFFSET function by pressing [2L].
WRITE the required offset value and direction (for example, L5 or 5L), and enter it into [1L] field.
CHECK or INSERT the START WPT from the list in [3L] - [5L] fields or manually enter it.
CHECK or ENTER the INTCP ANGLE in [1R] field.
CHECK OR INSERT the END WPT from the list in [3R] - [5R] fields or manually enter it.
PRESS INSERT in [6R] field to activate the OFFSET.



FLIGHT PLAN IN CRUISE WITH A LEFT OFFSET CURRENTLY FLOWN.

MANUAL CANCELLATION OF AN OFFSET

There are two standard methods for cancelling an offset:
1. SELECT DIR TO a waypoint (the next waypoint, for example).
2. SELECT a Lateral Revision (LAT REV) at FROM WPT.

CLEAR the OFFSET field or enter “0” in the OFFSET value field [1L], and press INSERT* in [6R] to activate the temporary flight plan (cancelling OFFSET), or
PRESS the OFFSET DELETE prompt [6R] to activate the temporary flight plan (cancelling OFFSET).

ALTERNATE FUNCTION

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_20-30-10-15-C-00007240.0001001 / 09 FEB 11

26

GENERAL

The ALTERNATE FUNCTION performs two actions:

- It reviews and defines alternate airports and inserts them into the flight plan.
- It allows a diversion to be activated through the ENABLE ALTN command.

Ident.: DSC-22_20-30-10-15-C-00007217.0009001 / 23 JUN 15

27

REVIEW AND SELECTION OF ALTERNATE AIRPORT

Several alternate airfields may be stored in the database and assigned to a destination. When the pilot selects a company route (CO RTE) (or a city pair), the computer strings the preferred alternate into the active flight plan.

The pilot may review the alternate airports on the ALTN page and, if the one selected is not suitable because of weather or fuel considerations, another alternate may be strung into the active flight plan.
The pilot may define an additional alternate airport into the list, if necessary.
The ALTERNATE page shows the track and distance (airway or direct) between destination and alternate, as well as fuel management data (EXTRA fuel, assuming the associated airfield is the alternate airport). This data will help the pilot change the preferred alternate, if necessary.
Access the ALTERNATE page through the ALTN prompt on the LAT REV page at destination.
Alternate airfields are attached to the destination.

ENTERING NEW ALTERNATE INTO THE F-PLN

If the preferred alternate is unsuitable, proceed as follows:

SELECT F-PLN key on MCDU.
SELECT LAT REV at destination.
SELECT ALTN [5L].
SELECT an AIRFIELD IDENTIFIER.
INSERT the temporary flight plan.

Note: *If weather and destination airfield conditions permit, you may select “NO ALTN”. Fuel predictions will be computed without alternate fuel.*

SELECTION OF ANOTHER ALTERNATE

Fuel management information for flight to another alternate airfield may be obtained by selecting the OTHER ALTN field.

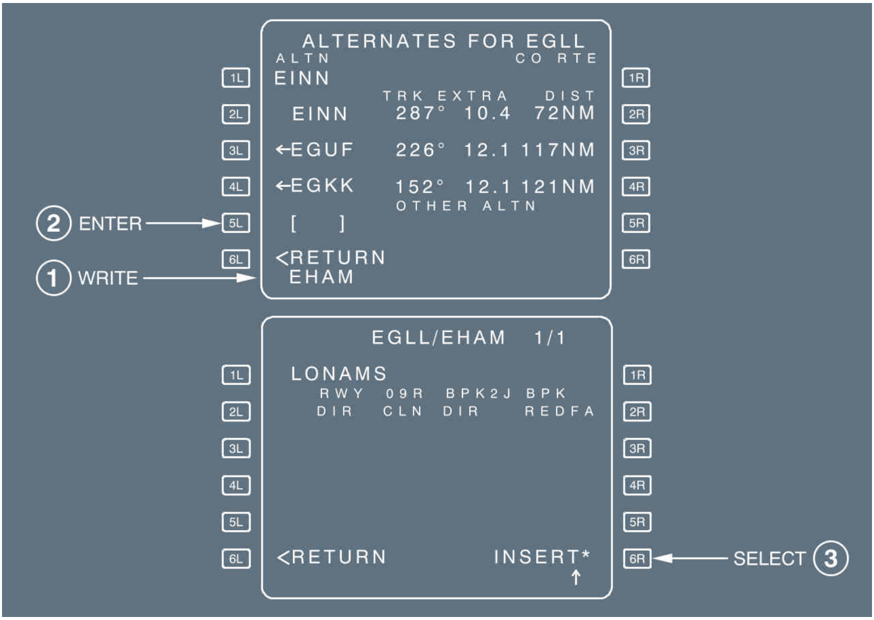
SELECT LAT REV at DESTINATION.
SELECT ALTN [5L].

ENTER the airfield identifier in the brackets.

- *If the airfield is not in the database, the NEW RUNWAY page automatically appears.*
- *If the airfield is in the database and there is a company route (CO RTE) to it, the ROUTE SELECTION page automatically appears.*

SELECT the route, as appropriate, or RETURN to the ALTN page.
ENTER the distance in the brackets (if required). XTRA fuel and track (TRK) will appear.
SELECT the other alternate (OTHER ALTN) as a primary alternate if convenient. (EXTRA fuel and DIST revert to AIRWAY distance).
INSERT it, if you want to have it as a primary alternate.

<u>Note:</u>
- *The pilot can always overwrite the “OTHER ALTN”. The new “OTHER ALTN” then replaces the previous one, which is lost.*
- *The pilot can select OTHER ALTN as a primary alternate (active flight plan), to replace any alternate on the initial list.*
- *If the pilot selects the other alternate as a primary alternate, and overwrites the OTHER ALTN field by entering a new airport, the first one will remain a primary alternate and the system will memorize a second OTHER ALTN.*



```

The pilot may enter a distance in the OTHER ALTN field. The system will compute the extra fuel and the track for this distance.

PREDICTED DATA FOR ALTERNATE

Data predictions are based on:

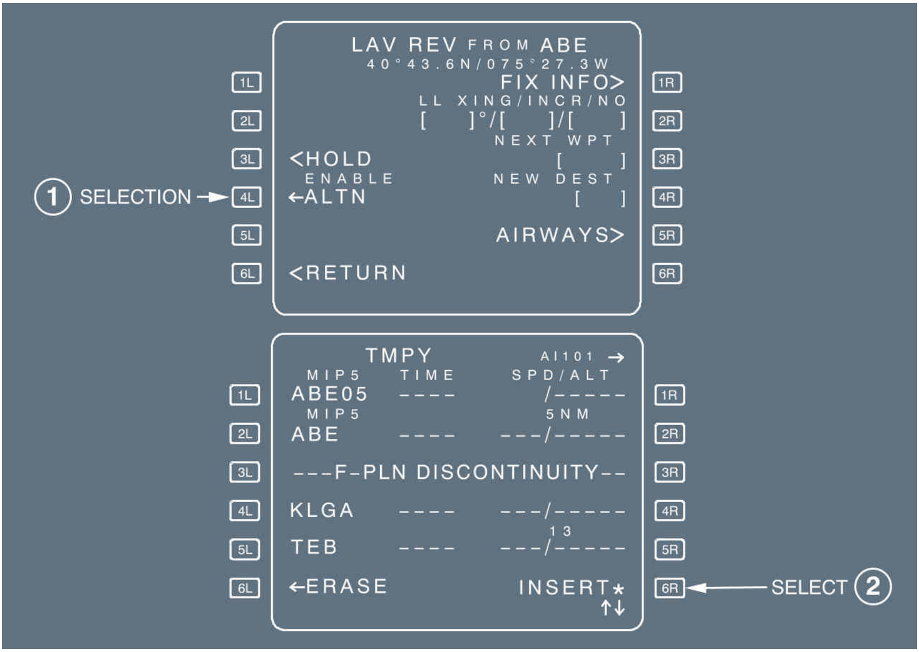
- Aircraft weight being equal to landing weight at primary destination.
- Flight at FL 100 if the alternate F-PLN length is less than 100 NM , at FL 220 if the alternate F-PLN length is comprised between 100 and 200 NM , or else at FL 310.
- Cost index 0.
- Constant wind (as entered in the alternate field of the DES WIND page).
- Constant delta ISA (equal to delta ISA at primary destination).
- The along flight path distance from the destination to the alternate airport. If the flight crew enters an ALTN fuel value, this value is the one taken into account.

ENABLE ALTN

Ident.: DSC-22_20-30-10-15-00000467.0009001 / 01 OCT 12

28 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This enables the pilot to initiate a diversion by entering the alternate flight plan just after the revision waypoint (with a discontinuity).
The pilot may have to adjust the resulting flight plan (use “direct to”, or add or suppress waypoints), depending on the circumstances.



```

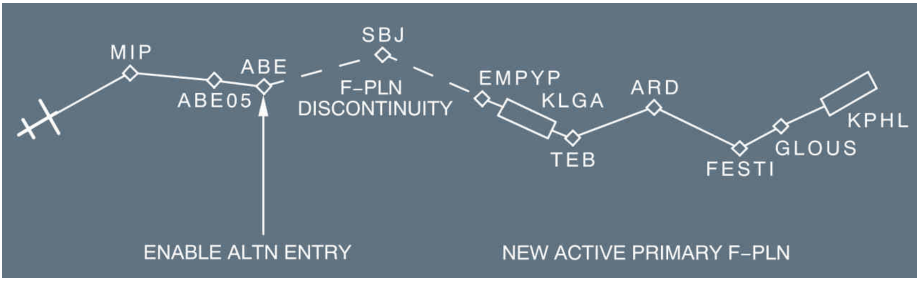
TO ACTIVATE THE PRIMARY ALTN:

SELECT a LAT REV at the “TO” waypoint (or at another suitable waypoint).
PRESS the ENABLE ALTN key.
INSERT the temporary flight plan.
ENTER an appropriate waypoint in DIRECT TO and adjust the flight plan.
ADJUST the cost index on the PERF page and the defaulted cruise flight level (CRZ FL) on the PROG page, as required.



When ENABLE ALT is pressed at ABE, a flight plan discontinuity is created from ABE down to destination and the alternate route is linked to the active flight plan.

DIR KEY (DIRECT-TO-FUNCTION)

Ident.: DSC-22_20-30-10-15-D-00007243.0001001 / 30 MAR 18

29

GENERAL

The pilot uses the “Direct To” function to define a direct leg from the present position to any waypoint on the active flight plan or to any waypoint.

The designated waypoint may be entered by its identifier (if it is stored in the database) or by a latitude/longitude, place/bearing/distance, or a place-bearing/place-bearing.

Note: 1. *If the autopilot or flight director is in the heading/track or localizer mode, the DIR TO function engages the NAV mode.*
2. *A lateral revision of the flight plan obtained with a DIR TO may also affect the vertical profile of the flight plan.*

Three functions are available through the DIR TO key:

- The DIR TO defines a direct leg from the present position to a specified waypoint.
  NAV mode engages simultaneously to the DIR TO selection.
  When the pilot uses DIR TO, the present position (PPOS) becomes the “FROM” waypoint and the active flight plan shows it as the T-P (turn point).
- The DIR TO/ABEAM function, defines the abeam waypoints along the direct leg. These waypoints are the projection on the direct leg of the initial F-PLN waypoints located between the aircraft position and the specified waypoint.
  NAV mode engages simultaneously to the DIR TO/ABEAM selection.
- The DIR TO/INTCPT function allows the definition of a specified RADIAL INBOUND or OUTBOUND at an inserted waypoint. The current aircraft track is used to compute the INTCPT point with the specified radial.
  NAV mode is armed simultaneously to the DIR TO/INTCPT selection.

The ND displays the DIR TO leg as a temporary flight plan leg between current aircraft position and specified waypoint. In case of a DIR TO/INTCPT, the leg is not displayed when the angle between the current aircraft track and the intercept radial exceeds 160 °.

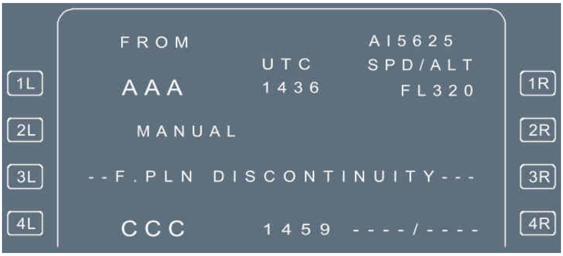
31

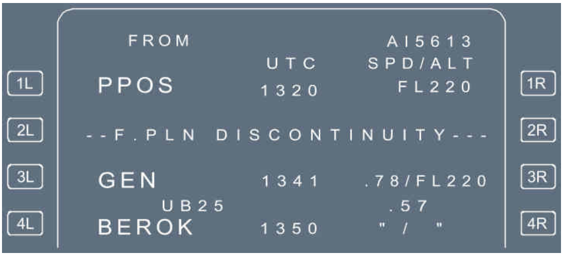
PARTICULAR CASES FOR USE OF DIR TO

- If the pilot is flying a manual leg (part of a SID or STAR), the flight plan page displays “F-PLN DISCONTINUITY”, preceded by “MANUAL” (see below).
  These legs are specific heading or track legs flown with no defined end waypoint.



```
     FROM                    AI5625
                   UTC      SPD/ALT
1L   AAA           1436       FL320    1R
      MANUAL                           
2L                                     2R
3L  --F.PLN DISCONTINUITY---           3R
4L   CCC           1459    ----/----   4R
```

- When the pilot encounters a flight plan discontinuity, or if a major reset occurs, the flight plan page displays “PPOS - F-PLAN DISCONTINUITY”, and the pilot looses managed guidance in both the lateral and vertical plans.
  The autopilot or flight director reverts to the basic HDG V/S (or TRK FPA) modes. Predictions remain available and are based on the assumption that the aircraft will fly a direct leg from its present position to the next waypoint.



```
     FROM                    AI5613
                   UTC      SPD/ALT
1L  PPOS           1320       FL220    1R
2L  --F.PLN DISCONTINUITY---           2R
3L  GEN            1341    .78/FL220   3R
         UB25               .57
4L  BEROK          1350     "  /  "    4R
```

- **In both of these cases, the only way to get back to a standard flight plan is to perform a “ DIR TO ” to a designated waypoint.**
- Following a DIR TO, the message “MAP PARTLY DISPLAYED” may appear on the NDs, if the new flight plan includes a very long leg, (*Refer to DSC-31-45 Flags and Messages Displayed on ND*). When this message comes up, enter an intermediate waypoint to shorten the leg.

Note: *During cruise, the DIR TO function is not available as long as uplink wind data, received through ACARS ◁ , is not inserted or cancelled on the CRUISE WIND page.*

Note: 1. *If, between two waypoints projected on the direct leg, there was a discontinuity in the original flight plan, this discontinuity disappears between the corresponding abeam points on the direct leg.*

2. *. Abeam waypoints computed from latitude/longitude-type waypoints are renamed by the system as "AB XXXXX", where "xxxxx" is an abbreviation in 5 characters, of the latitude and longitude of the initial waypoints.*

PROCEDURE FOR DIR TO/INTERCEPT

PRESS the DIR key.
WRITE the waypoint identifier into the scratchpad.
PRESS [1L] to enter the waypoint in the DIR TO field.

In the [1R] and [2R] fields, the MCDU displays the functions radial inbound and radial outbound from the waypoint.
If the waypoint belongs to the flight plan, the system displays the flight plan track as the default inbound radial. The crew can modify it.

WRITE the required in or out radial into the scratchpad.
PRESS [1R] or [2R] to enter the radial in the required field.

The ND displays the entered radial as an amber dotted line : The pilot can still modify it.

PRESS [1R] or [2R] to confirm the DIR TO/INTERCEPT selection.

The display reverts to the F-PLN A page, the system arms the NAV mode, and engages the HDG mode. The FROM waypoint is the aircraft position at the time of the DIR TO/INTERCEPT selection. The MCDU indicates it as INBND or OUTBND.

<u>*Note:*</u>
1. *If the waypoint does not belong to the flight plan, the system strings the DIR TO/INTERCEPT leg to this waypoint, and inserts a discontinuity following the waypoint.*
2. *A DIR TO/INTERCEPT cancels any active offset.*
3. *If the current AP/FD lateral mode is HDG or TRK, NAV becomes armed.* *If the NAV mode was engaged, NAV becomes armed. FCU HDG or TRK must be used to guide the aircraft.* *The ND displays an intercept point, if the intercept angle is less than 120 °. The system constantly updates it to reflect the current aircraft track and position with respect to the intercept radial. The NAV mode engages when reaching the intercept point.*

OVFY (OVERFLY) KEY

Ident.: DSC-22_20-30-10-15-00000469.0001001 / 01 OCT 12

34 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The overfly key programs the Flight Management Guidance Computer to fly over a specific waypoint or NAVAID. To use it:

PRESS the “OVFY” key.

A “Δ” appears in the scratchpad.

INSERT it by pressing the key adjacent to the waypoint to be overflown. [3L] in this example.

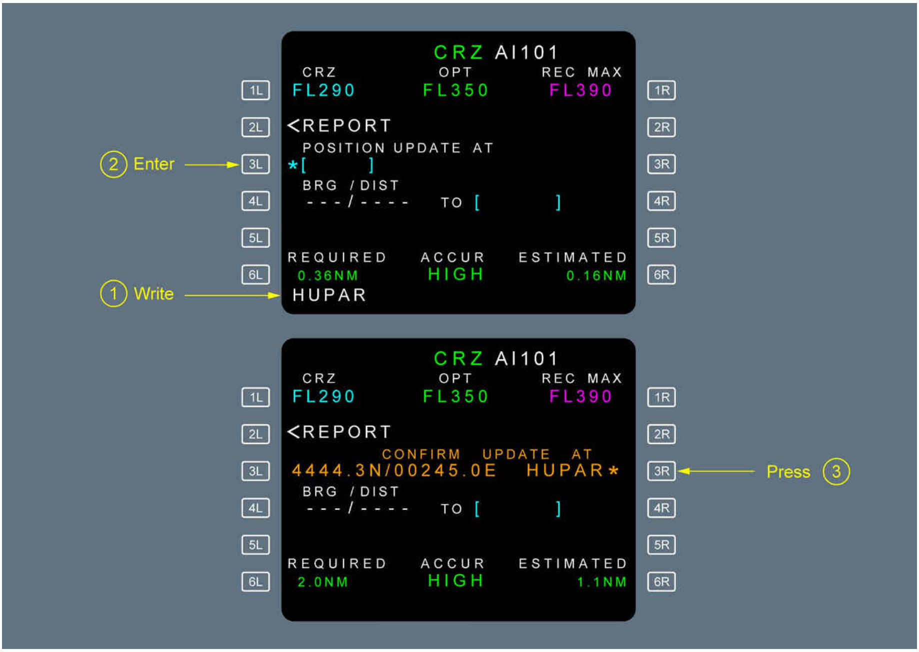
POSITION UPDATE AT

Ident.: DSC-22_20-30-10-15-00000470.0003001 / 04 JUN 19

35 **Applicable to: MSN 01376-01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

To manually change the position computed by the FMGC (FM position and bias), the pilot uses "POSITION UPDATE AT" on the progress page.
Use this facility with extreme caution: It is apt to be inaccurate, because it relies on the pilot's estimation of when a designated position has been reached.



```
          CRZ AI101

 BRG / DIST
 ---/----        TO [        ]

REQUIRED     ACCUR    ESTIMATED
 2.0NM       HIGH         1.1NM
```

WRITE the ident for the NAVAID (or waypoint or airport), or the coordinates, or the PBD or PBX (Place/Bearing-Place/Bearing) at which the update is intended.
Press [3L] to ENTER the ident in the "POSITION UPDATE AT" field. The coordinates of the point, along with its identifier (or "ENTRY", if the identifier is not in the database), appear in that field.
PRESS [3R] to activate the update, when you estimate that you are at the position.

Note: *The system reinitializes the Estimated Position Error computation when a position update is performed. This may lead to the appearance of a "NAV ACCUR DOWNGRAD" or "NAV ACCUR UPGRAD" message.*

If the “POSITION UPDATE AT” does not properly take effect, it corrupts the FM position.

- In an area with good radio NAVAID coverage:
  - If the update error is small, subsequent radio position updating will correct the FM position.
  - If the update error is large, the system will reject any radio updating because its internal “reasonableness test” will reject the various NAVAIDs. Thus, the FM position will only be the MIX IRS position corrected by the position bias, determined at the time of the update, and the error will be maintained.
- In an area without proper NAVAID coverage, radio position updating will not be available and the FM position, if incorrect, will remain incorrect until a new manual update is performed.
- Therefore, the pilot should only use “POSITION UPDATE AT” in case of a major position problem, such as:
  - On the ground, no flight plan appears on the navigation display and ARC/ROSE NAV mode is selected.
  - A “CHECK IRS/FM POSITION” message appears on the MCDU.
  - A “FM/IR POSITION DISAGREE” message appears on the ECAM.

When the GPS PRIMARY ◁ is operative, the POSITION UPDATE AT is inhibited.

UPDATE AT

Ident.: DSC-22_20-30-10-15-00000470.0001001 / 04 JUN 19

36 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

To manually change the position computed by the FMGC (FM position and bias), the pilot uses “UPDATE AT” on the progress page.
Use this facility with extreme caution: It is apt to be inaccurate, because it relies on the pilot's estimation of when a designated position has been reached.

REQUIRED   ACCUR   ESTIMATED
 2.0NM     HIGH        1.1NM
```

WRITE the ident for the NAVAID (or waypoint or airport), or the coordinates, or the PBD or PBX (Place/Bearing-Place/Bearing) at which the update is intended.
Press [3L] to ENTER the ident in the “UPDATE AT” field. The coordinates of the point, along with its identifier (or “ENTRY”, if the identifier is not in the database), appear in that field.
PRESS [3R] to activate the update, when you estimate that you are at the position.

Note: *The system reinitializes the Estimated Position Error computation when a position update is performed. This may lead to the appearance of a “NAV ACCUR DOWNGRAD” or “NAV ACCUR UPGRAD” message.*

If the “UPDATE AT” does not properly take effect, it corrupts the FM position.

- In an area with good radio NAVAID coverage:
  - If the update error is small, subsequent radio position updating will correct the FM position.
  - If the update error is large, the system will reject any radio updating because its internal “reasonableness test” will reject the various NAVAIDs. Thus, the FM position will only be the MIX IRS position corrected by the position bias, determined at the time of the update, and the error will be maintained.
- In an area without proper NAVAID coverage, radio position updating will not be available and the FM position, if incorrect, will remain incorrect until a new manual update is performed.
- Therefore, the pilot should only use “UPDATE AT” in case of a major position problem, such as:
  - On the ground, no flight plan appears on the navigation display and ARC/ROSE NAV mode is selected.
  - A “CHECK IRS/FM POSITION” message appears on the MCDU.
  - A “FM/IR POSITION DISAGREE” message appears on the ECAM.

When GPS PRIMARY ◁ is operative, the FM position will always converge towards the GPS position at a rate depending on the aircraft altitude. Therefore, when GPS PRIMARY is operative, an inaccurate “update at” will have a temporary effect on the FM position.

Intentionally left blank

FMS2 Thales

GENERAL

Ident.: DSC-22_20-30-10-18-00005068.0004001 / 03 NOV 21
Applicable to: MSN 04827-04860

The lateral revision function enables the flight crew to create or modify the following parts of the flight plan:
- Airway
- Waypoint
- New destination
- Holding pattern
- Offset
- Alternate
- Fix information
  Each time the flight crew activates one of the above-listed revisions, the flight crew accesses a temporary flight plan that enables the modification to be checked before inserting it in the active flight plan. The flight crew selects these functions by pressing the left keys on F-PLN A or B.
- Direct to and overfly functions are accessed via the MCDU keys. No temporary flight plan is created with these functions.
- “Position Update at” capability is a specific function that manually updates the FM position. It does not use a temporary flight plan, but the flight crew must confirm its insertion before it is activated.

TEMPORARY F-PLN (TMPY)

Ident.: DSC-22_20-30-10-18-00000472.0002001 / 23 JUN 15
Applicable to: MSN 04827-04860

A temporary F-PLN is created whenever a revision is performed on either of the following pages:
- The F-PLN A or B pages, or
- The LAT REV page, or
- The VERT REV page.

The flight crew can perform several revisions in the same temporary flight plan before inserting it.
The TMPY F-PLN is a copy of the active F-PLN, but is corrected by the lateral or vertical revisions in progress.
The UNDO function is available when there is more than one pending revision in the temporary F-PLN. It can only be used once by the crew to cancel the last revision in the temporary F-PLN.
The temporary F-PLN created subsequently to a DIR TO function can only be modified once.
The aircraft continues to follow the active F-PLN, until the temporary revision is inserted.
The temporary F-PLN is continually sequenced as the active F-PLN, until it diverges from the active F-PLN.

The revision data appears in yellow (except Missed approach and Alternate parts that are displayed in blue) on both MCDUs and NDs.

- Lateral and vertical revisions can be made on a temporary F-PLN
- Only one temporary F-PLN may be accessed at a time
- A TMPY F-PLN cannot be created when a DIR TO is already in process. (The “DIR TO IN PROCESS” message appears on the MCDU).
- A TMPY F-PLN changes the title of the flight plan pages. (TMPY appears in all titles)
- The predictions are continually updated for a temporary flight plan.

                       ↑↓
```

Press 6L to cancel the last revision in the temporary F–PLN

Once inserted temporary data becomes active and is displayed in green.
As soon as a TMPY F-PLN is created, "TMPY F-PLN and "TMPY INSERT" are displayed on most pages in [6L] and [6R] fields. "TMPY F-PLN" allows access to temporary flight plan page, and "TMPY INSERT" allows insertion of the TMPY F-PLN.
The temporary flight plan can be inserted from the TMPY F-PLN page or from some other MCDU pages through the TMPY INSERT prompt.
Prior to insertion the flight crew should check the temporary flight plan. This check can be performed through:

- A simple check of parameters entered on the MCDU (e.g. for altitude or speed constraints entries)
- A visual check of the TMPY F-PLN on ND (e.g. for holds and offsets insertions)
- An access to the TMPY F-PLN page and a precise review of all this flight plan (e.g. for departure or arrival entries).

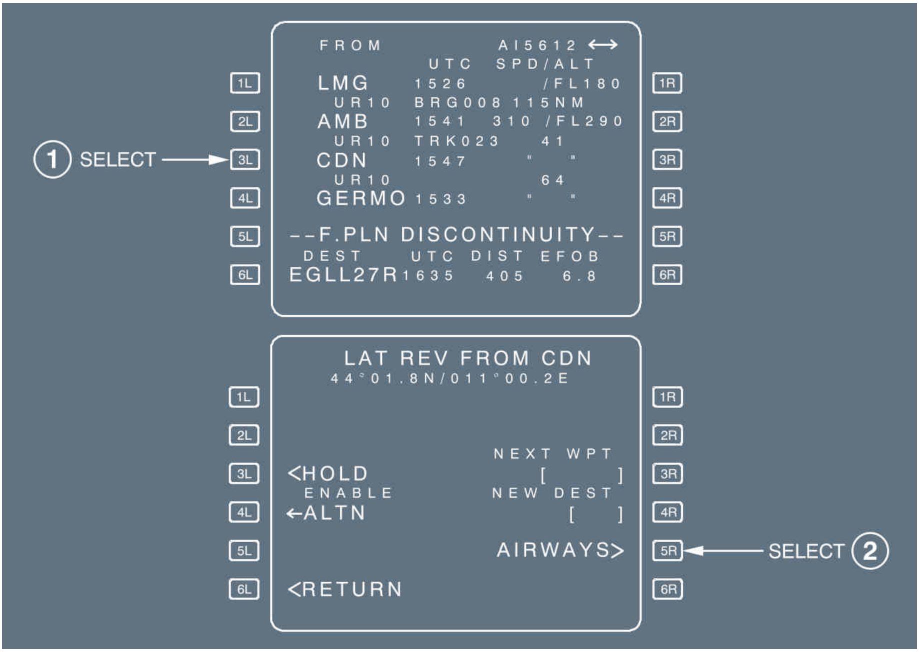
It is up to the flight crew to determine which check is necessary depending on the complexity of the revision and the moment when this revision is performed.

INSERTING AN AIRWAY WITH "VIA"

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-A-00000473.0003001 / 01 OCT 12

In the active F-PLN, the crew can insert up to 5 successive airway segments, going from a revised waypoint or ending at a given waypoint of the flight plan.



```
 FROM              AI5612 ↔
          UTC    SPD/ALT

WRITE the first airway ident in the scratchpad (here: "UB19").
PRESS [1L] to insert it into the VIA field.
WRITE the second airway ident in the scratchpad (here: "UB25").
PRESS [2L] to insert it into the VIA field.

The system automatically determines the first downpath intersection point between the two airways.

- If the airways have a common waypoint, the system selects it as the ending point of the first airway.
- If they have no common waypoint, but have a single intersection, the system creates this intersection as an FM-computed point and displays “X”, followed by the second airway’s ident (here XUB25).
- If they have no common waypoint or intersection, the system displays NO INTERSECTION FOUND in the scratchpad.

When the required airways (up to 5) have been entered, the crew enters the ending point of the last selected airway :

WRITE the ending waypoint in the scratchpad (here PON).
PRESS [1R] to insert it into the TO field.

Note:
- *If the revise waypoint, or the ending waypoint, does not belong to the entered airway, the system displays AWY/WPT MISMATCH in the scratchpad.*
- *If two waypoints with the same ident belong to the same airway, the DUPLICATE NAMES page will not be called up, and the system selects the first one in the database.*

Ident.: DSC-22_20-30-10-18-A-00009503.0003001 / 24 JAN 11

FLIGHT PLAN INSERTION

The flight crew uses the “< TMPY F-PLN” prompt to access and review the TMPY F-PLN. When the TMPY F-PLN has been checked, and if necessary modified, the crew inserts it.

CHECK and INSERT the TMPY F-PLN, or continue with the next revision

INSERTING A WAYPOINT

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-B-00000474.0007001 / 24 JAN 11

GENERAL

Waypoints can be inserted by means of a lateral revision at the “NEXT WAYPOINT”. This process creates a temporary flight plan. This method enables the temporary flight plan to be checked before it is inserted.

Ident.: DSC-22_20-30-10-18-B-00009504.0001001 / 24 JAN 11

WAYPOINT IDENTIFICATION

The pilot can identify a waypoint by :

- Its identifier (if it is in the navigation database).
- A Latitude/Longitude (LL).
- A Place/Bearing/Distance (PBD). The waypoint is defined by its bearing and distance from a place.
- A Place-Bearing/Place-Bearing (PBX). The waypoint is defined by the interception of 2 radials from 2 places.
- A Place/Distance (PD). The waypoint is defined by a distance from a place, along the F-PLN.

Note: *If a slash or a dash is not entered properly, the MCDU displays a “FORMAT ERROR” message.*

When the Flight Management Guidance System receives a pilot defined waypoint that is not in the database, it identifies it as LLxx, or PBD xx, or PBX xx, or PD xx (xx is a two-digit number between 01 and 20) and stores it in the stored waypoints file of the database.

Note: *When NAV mode is engaged, the crew cannot modify the "TO" waypoint (active leg) using the waypoint insertion function. If the crew wants to modify it, the DIR TO function will be used.*

Ident.: DSC-22_20-30-10-18-B-00009505.0001001 / 14 MAY 12

ALONG TRACK OFFSET WAYPOINT INSERTION

On the F-PLN or STEP ALTS page, the pilot can enter an along track offset waypoint, defined as a place/distance waypoint. This results in the creation of a temporary F-PLN. The function has no effect on the active F-PLN until the temporary F-PLN is inserted.

WRITE the waypoint identifier and the distance from this place.

According to the sign of the distance, the crew may define an along track waypoint before or after the revised place (Example : AMB/-040).

PRESS the appropriate key adjacent to the place identifier. The system automatically positions the waypoint in the flight plan.

This operation does not create any discontinuity.
The system does not accept an along track waypoint entered at the FROM waypoint.

PRESS the [6L] key to access the temporary F-PLN. Revise as necessary.
PRESS the [6R] key to insert the temporary into the active F-PLN.

SELECT the lateral revision (LAT REV) function at an appropriate waypoint.
WRITE the waypoint identifier, or LAT/LONG, or Place/Bearing/Distance, or Place-Bearing in the scratchpad.
ENTER it in the brackets under the NEXT WPT (next waypoint). A temporary F-PLN is automatically displayed.
CLEAR the F-PLN discontinuity, as appropriate, in the temporary F-PLN. Revise as necessary.
PRESS the [6R] key to insert the temporary into the active F-PLN.

FIX INFO

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-H-00012787.0001001 / 24 JAN 11

When using the FIX INFO function, the flight crew defines waypoint intersections of the flight plan with radials, circle or abeam associated to a fix.
When the flight crew inserts the intersection points, the system automatically identifies these points, but does not store them in the navigation database.

Ident.: DSC-22_20-30-10-18-H-00012788.0001001 / 01 OCT 12

The flight crew accesses the radial intercept function from the LAT REV page at the origin, at the FROM waypoint, or at a waypoint.

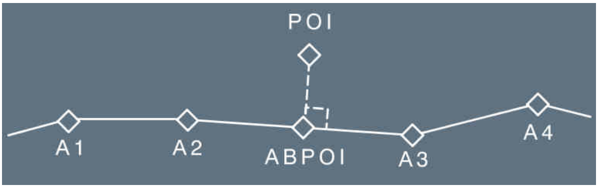
ABEAM INTCPT POINT IS COMPUTED AND INSERTABLE

WRITE the reference fix identifier into the scratchpad (here POI), and ENTER it [1L].
SELECT the ABEAM prompt [5L]:

A blue dashed line from the REF FIX and perpendicular to the flight plan appears on the ND. The system computes the radial, time, along path distance, altitude and predictions related to the waypoint abeam the reference fix.

SELECT [5L] to insert the abeam intercept waypoint into the flight plan, if needed:

The system automatically assigns its identifier as AB, followed by the first five characters of the reference fix identifier (Example ABPOI). The blue dashed line disappears from the ND.



INSERTING A NEW DESTINATION

Ident.: DSC-22_20-30-10-18-00000475.0001001 / 01 OCT 12
Applicable to: MSN 04827-04860

The pilot may define a new destination, and insert it via the lateral revision page. This results in the creation of a temporary F-PLN. The function has no effect on the active F-PLN, until the temporary F-PLN is inserted. The pilot may then call up the new destination from any waypoint along the flight plan, except the FROM waypoint, the destination, and the missed-approach waypoint. When the new destination has been inserted, a flight plan discontinuity appears between the revision waypoint and the new destination. All waypoints beyond the revision waypoint (including the previous destination and associated missed approach) are deleted.

SELECT the lateral revision function at an appropriate waypoint.
WRITE the new destination in the scratchpad.
Enter it in the brackets under “NEW DEST”. A temporary F-PLN is automatically displayed.
CLEAR the F-PLN discontinuity in the temporary F-PLN. Revise as necessary.
PRESS the [6R] key to insert the temporary into the active F-PLN.

HOLDING PATTERN

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-C-00000476.0001001 / 24 JAN 11

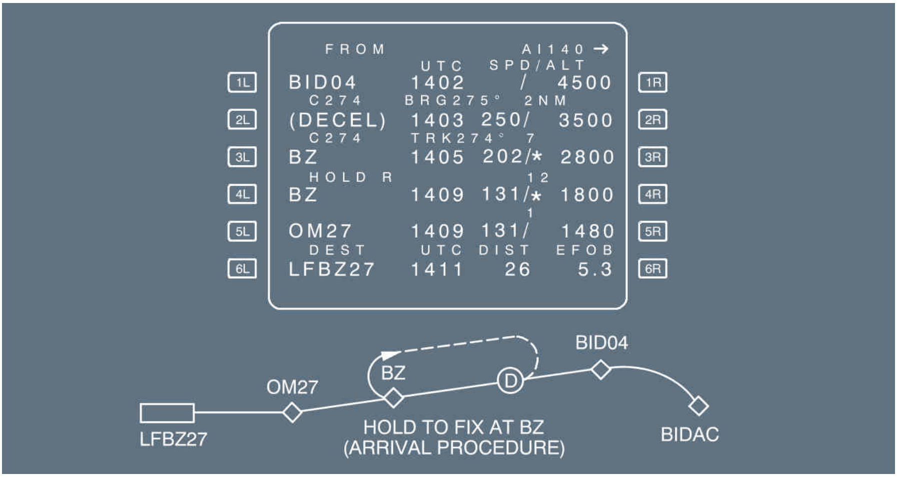
GENERAL

This section describes holding patterns, associated guidance and flight crew procedures. The Flight Management and Guidance Computer (FMGC) has three types of holding patterns that the pilot can use in a flight plan.

Ident.: DSC-22_20-30-10-18-C-00009509.0001001 / 01 OCT 12

HOLD TO FIX (HF)

The holding pattern is always part of an arrival or departure procedure. The aircraft flies it once, and then automatically exits the holding pattern at the fix. The predicted speed in the holding pattern is the lowest of the ICAO speed limit, max endurance speed, or any speed constraint. Guidance to the fix in the holding pattern is similar to that on any leg of a flight plan. The HF patterns are part of the navigation database and cannot be created by the crew.



```

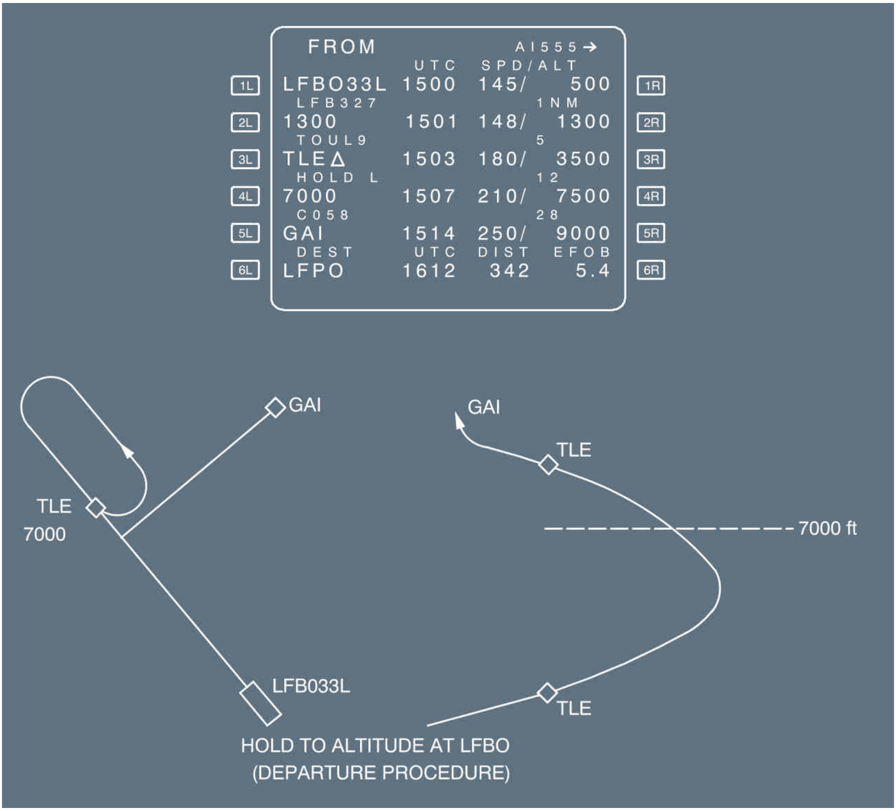
HOLD TO FIX AT BZ
(ARRIVAL PROCEDURE)

Ident.: DSC-22_20-30-10-18-C-00009513.0001001 / 19 DEC 12

HOLD TO ALTITUDE (HA)

The aircraft flies the hold until it reaches the specified altitude. Then, it automatically exits the hold at the fix.
The predicted speed for the holding pattern is the lowest of the ICAO speed limits, the max endurance speed, or any speed constraint.

The size of the holding pattern is a function of the predicted speed.
Guidance in a hold to altitude (HA) is similar to that for any leg of a flight plan.
The HAs are in the navigation database, as part of the arrival or departure procedures, and cannot be created by the crew.



```

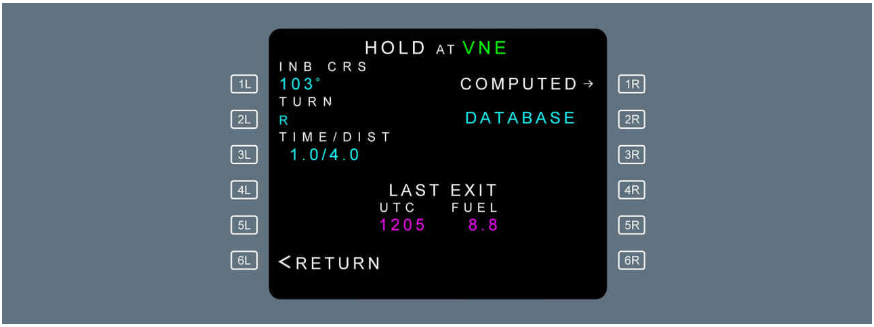
HOLD TO ALTITUDE AT LFBO
(DEPARTURE PROCEDURE)

HOLD WITH MANUAL TERMINATION (HM)

This type of holding pattern may be part of an arrival procedure, or the flight crew may enter it at the present position or at any flight plan waypoint.
The flight crew will use this type of holding pattern to comply with a defined procedure or a clearance limit, or to meet an operational need (such as losing altitude, holding for weather improvement, or absorbing an ATC delay).

This type of holding pattern is exited according to the flight crew’s decision, not automatically.
There are 3 types of HMs, and all are modifiable.

DATABASE HOLD



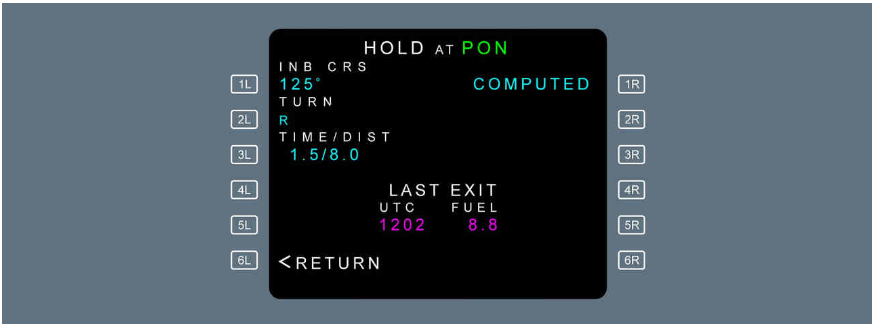
```
        HOLD AT VNE
INB CRS
103°                COMPUTED →
TURN
R                    DATABASE
TIME/DIST
 1.0/4.0

            LAST EXIT
            UTC    FUEL
            1205    8.8

<RETURN
```

If the holding pattern is part of the database, all its associated data (inbound course, turn direction, time/distance) are defined in the database. The flight crew can modify this data, leading to the creation of a temporary F-PLN.

COMPUTED HOLD



```
        HOLD AT PON
INB CRS
125°                  COMPUTED
TURN
R
TIME/DIST
 1.5/8.0

            LAST EXIT
            UTC    FUEL
            1202    8.8

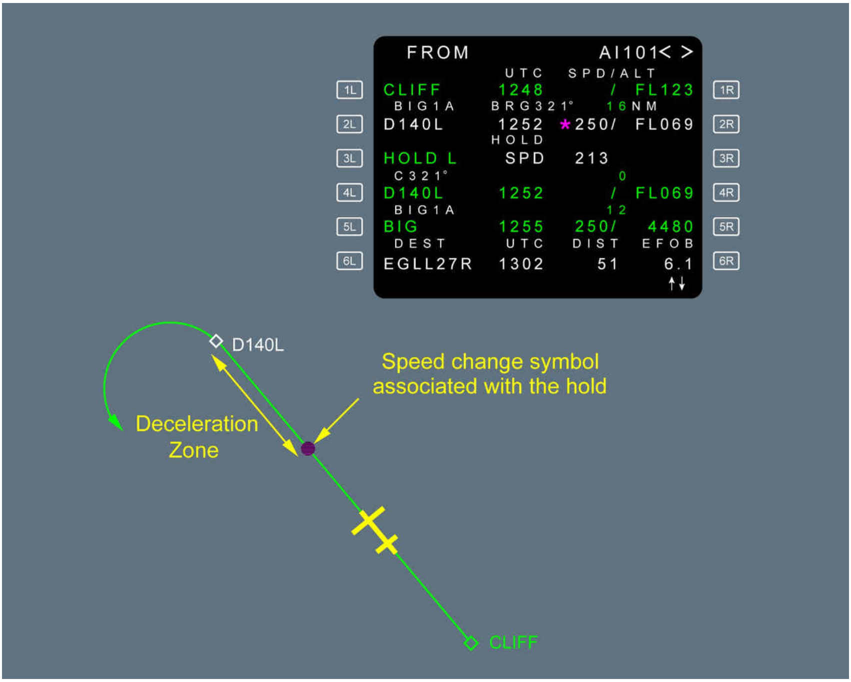
<RETURN
```

If the holding pattern is not in the database, the FMS designs a holding pattern and proposes it to the flight crew. The associated data consists of default values that the flight crew can modify. This results in creating a temporary F-PLN.

PREDICTIONS AND GUIDANCE ASSOCIATED WITH A HM HOLDING PATTERN (HOLD WITH MANUAL TERMINATION)

Before Deceleration

If an altitude constraint is defined at the hold entry fix, then the FMS duplicates this constraint on the hold exit.
However, different constraints may be inserted at entry and exit fixes.
Although the hold is inserted in the flight plan, the FMS does not take it into account for predictions until the aircraft enters the hold.
However, if the hold is not deleted by the flight crew, the FMS schedules a deceleration point and displays it on the ND.



```

<RETURN

The FMS predicts the estimated time and amount of fuel remaining at which the aircraft must exit holding, so as to comply with the fuel policy specified on the FUEL PRED page.
When the aircraft enters the holding pattern, the FMS revises all predictions and assumes the aircraft will fly one turn of the holding pattern.
Each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding circuit.

Upon Reaching the Speed Change Pseudo Waypoint

The FMS either causes the aircraft to decelerate to the hold speed (if managed speed is active and NAV mode engaged), or display SET HOLD SPEED on the MCDU and SET HOLD SPEED on the PFD, if the flight crew selected a speed target.

The default hold speed is the lowest of the following:
- Maximum endurance speed
- ICAO limit holding speed
- Speed constraint (if any).

When no specific speed limit applies, the default hold speed is approximately equal to the following:
- Green Dot speed on the A318, A319, A320 (CFM or PW) and A321, or
- Green Dot +20 kt on the A320 (IAE).

The flight plan predictions for time and fuel do not yet consider that the hold will be flown. However, the ND shows the hold entry and holding pattern trajectory.

```

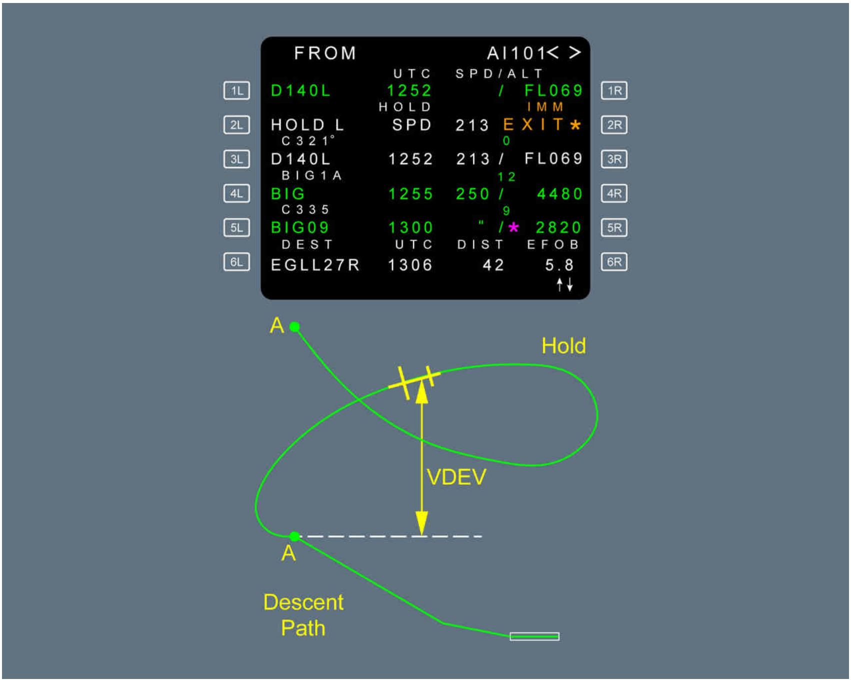
After Reaching the Hold Entry Fix

The aircraft enters the hold. The HOLD page displays the associated holding data:
- The inbound course (INB CRS)
- The TURN direction (L or R)

- The TIME/DIST
- The LAST EXIT time and the associated fuel to reach the alternate airport with no extra fuel.

The FMS assumes that the aircraft will fly one turn of the holding pattern, and revises the predictions accordingly.

When the holding pattern is defined by a leg time (and not a leg distance), the FMS revises the size of the hold as a function of the target speed:
- If managed speed is active, the FMS uses the predicted holding speed to calculate the size of the holding pattern
- If the selected speed is active, the FMS uses the target speed selected by the flight crew at the entry fix sequencing to calculate the size of the holding pattern
- The VDEV displayed on the PFD and the PROG page, when the aircraft is flying in the HM is the difference between the aircraft's current altitude and the altitude at which it should be when it reaches the hold exit fix in order to be correctly positioned on the descent path.



```

                            ↑↓
```

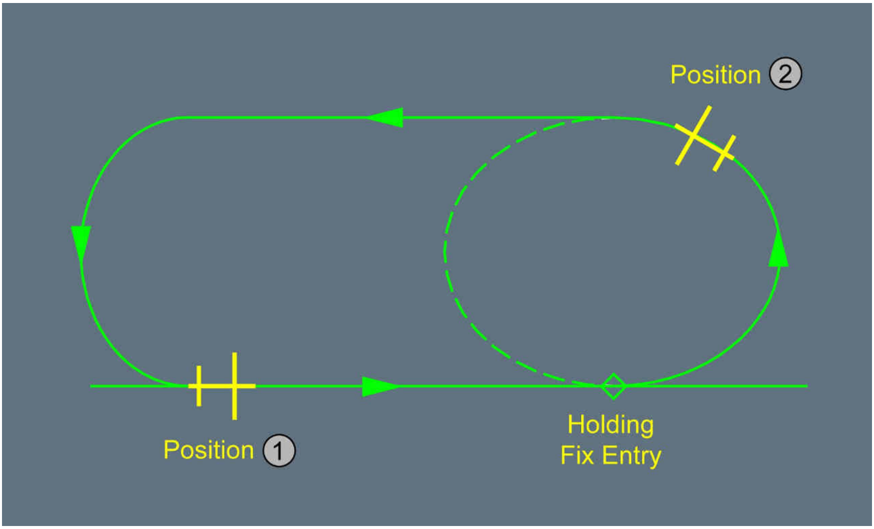
HOLD EXIT PROCEDURE



At position (1), if the flight crew selects IMM EXIT, the aircraft will exit at the next fix overfly.
At position (2), if the flight crew selects IMM EXIT, the aircraft will make an immediate turn to the fix where the hold will be exited.

If managed speed is active, the FMS sets the target speed to the applicable speed of the current phase (for example, speed constraint, ECON speed, or speed limit).
The FMS then assumes that the flight crew will continue on the descent path, if the aircraft is in descent.

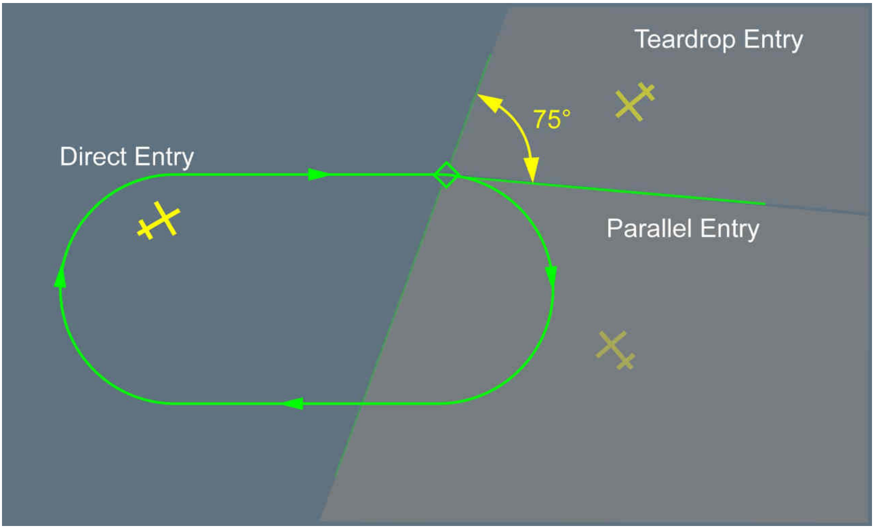
If DES mode is engaged, the following applies:
- The holding pattern is never included in the descent path computation
- The flight crew cannot enter altitude and speed constraints at the hold exit fix (This is only allowed at the hold entry fix)
- The vertical guidance in the HM, during the descent phase, is set to -1 000 ft/min but the FMS considers altitude constraints that will take effect farther down the flight path. The FMS will not allow the aircraft to descend below the next altitude constraint, neither to the FCU selected altitude. If the aircraft reaches the next altitude constraint, it will level off and the ALT CST mode will engage.

With RESUME HOLD Pressed

If the flight crew presses the key next to RESUME HOLD, the aircraft remains in the holding pattern, and IMM EXIT is displayed again.
After that, each time the aircraft flies over the holding fix, the FMS updates the predictions for one more holding circuit.

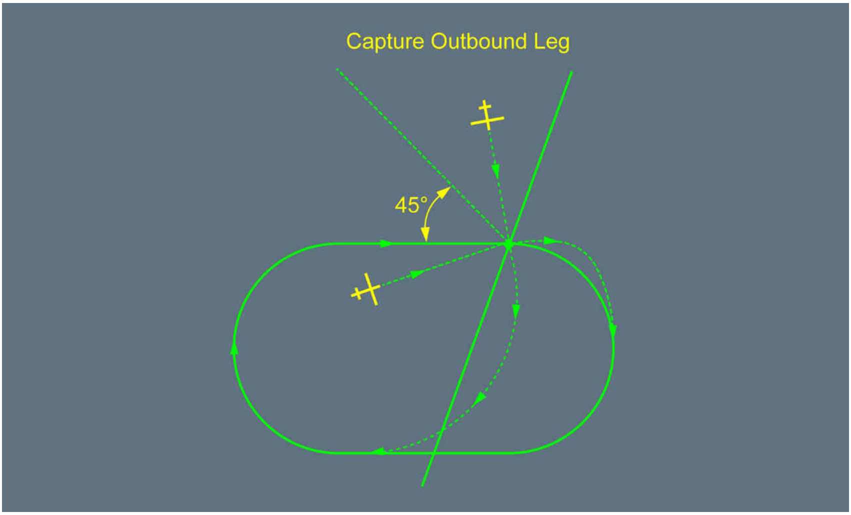
HOLDING PATTERN ENTRIES

The FMS offers three types of entry into holding patterns:
1. Direct entry
2. Teardrop entry
3. Parallel entry.



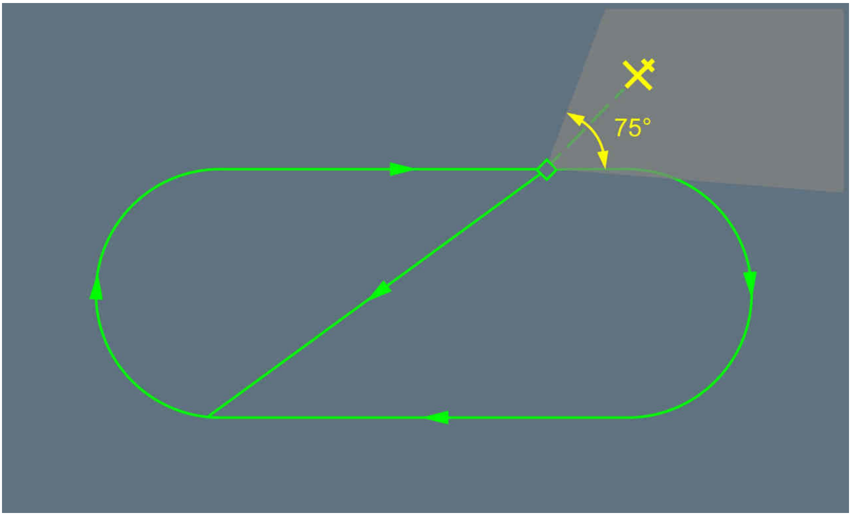
Teardrop Entry
75°
Direct Entry
Parallel Entry

1. Direct entry

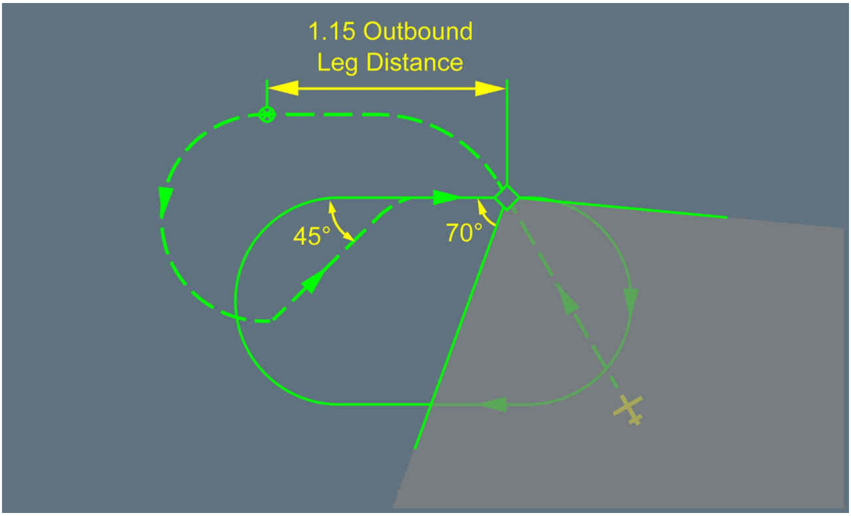


Capture Outbound Leg
45°

2. Teardrop entry

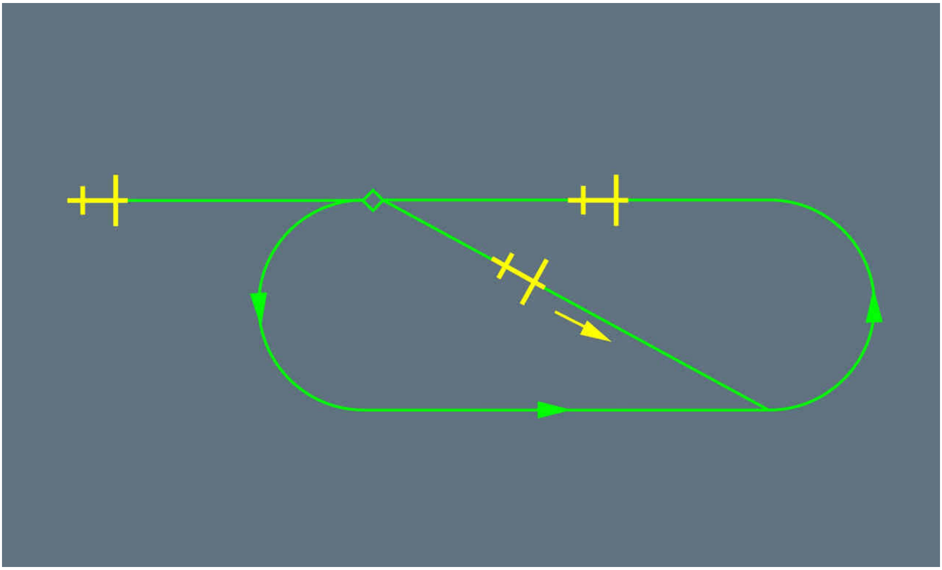


3. Parallel entry



1.15 Outbound
Leg Distance
45°
70°

Note: *If the leg the aircraft is flying toward the holding fix is on a "limit" between a teardrop entry and a parallel entry, the FMS may compute and display either of the two entries. The flight crew should keep this in mind, and should not assume that the FMS is malfunctioning.*
If the flight plan leg toward the hold entry fix is on a course that is the reciprocal of the inbound course of the holding pattern, the aircraft will fly a teardrop entry.



Ident.: DSC-22_20-30-10-18-C-00009515.0015001 / 01 OCT 12

PROCEDURE TO INSERT A HOLD (HOLD WITH MANUAL TERMINATION)

The HOLD prompt enables the crew to enter a holding pattern, with manual termination (HM), at the revised waypoint or at the present position.
The crew accesses the HOLD page from a lateral revision at the present position (PPOS), or at a waypoint. Using the HOLD function results in the creation of a temporary F-PLN. The function has no effect on the active F-PLN, until the temporary F-PLN is inserted.

PROCEDURE TO DELETE A HOLD (HOLD WITH MANUAL TERMINATION)

CLEAR the HOLD directly in the flight plan, as can be done for a normal waypoint.
CHECK and INSERT the TMPY F-PLN or continue with next revision

Note: Only the constraint on the entry fix of the hold are preserved.

OFFSET

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-D-00000477.0003001 / 17 MAY 21

The OFFSET prompt enables the crew to define a lateral offset to the left or right of the active flight plan. Once inserted, the offset applies from the present position (PPOS) all along the flight plan to the first waypoint (WPT) at which a holding pattern is defined, or to the last waypoint before the runway. In most cases, the crew will use it en-route, because of an ATC clearance, or to avoid bad weather expected along the flight plan route. Accessed from a lateral revision (LAT REV) at the FROM waypoint, an offset may be defined between 1 and 50 NM in one-nautical-mile steps and starts at PPOS. Using the offset function results in the creation of a temporary F-PLN. The function leads to the creation of a temporary flight plan. Once this TMPY F-PLN is inserted, the flight plan page shows OFFSET in its title, and the navigation display shows the offset flight plan with a solid green line and the original flight plan with a dashed green line. The offset can be manually suppressed by clearing the offset value in [1L] or by performing a DIR TO.

1. If a hold is inserted at PPOS, this hold is flown on the offset path. If a hold is inserted at another waypoint, the offset will be automatically deleted before the hold.
2. No offset can be computed on approach legs.
3. If the crew enters an OFFSET when the aircraft is too close to the TO waypoint, the FMGS may refuse to accept it, in which case the MCDU displays the “ENTRY OUT OF RANGE” message.

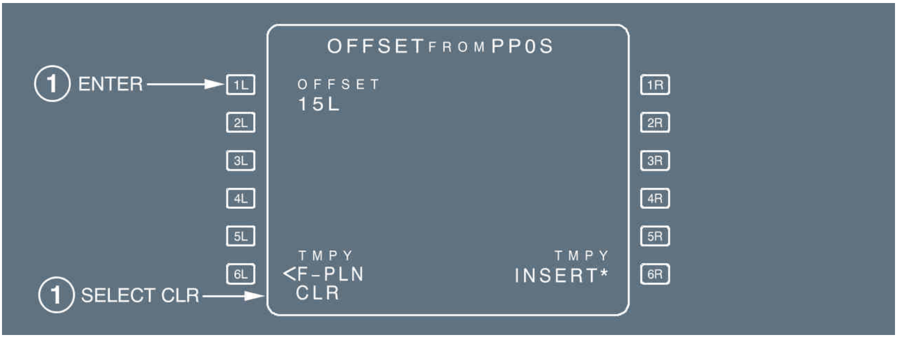
MANUAL CANCELLATION OF AN OFFSET

There are two standard methods of cancelling an offset :
1. PERFORM DIR TO a waypoint (the next waypoint, for example).
2. SELECT a Lateral Revision (LAT REV) at FROM WPT.

SELECT the OFFSET prompt.
CLEAR the OFFSET field (or ENTER a zero value in the OFFSET field).
CHECK and INSERT the TMPY F-PLN or continue with next revision.



ALTERNATE FUNCTION

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-E-00000478.0002001 / 24 JAN 11

The ALTERNATE FUNCTION performs two actions:
- It reviews and defines alternate airports and inserts them into the flight plan
- It allows a diversion to be activated through the ENABLE ALTN command.

Using the ALTERNATE function results in the creation of a temporary F-PLN. The function has no effect on the active F-PLN until the temporary is inserted.
An alternate airport may also be entered or modified through the dedicated field on INIT A page. In this case, no TMPY F-PLN is created.

Ident.: DSC-22_20-30-10-18-E-00009519.0003001 / 13 DEC 12

REVIEW AND SELECTION OF ALTERNATE AIRPORT

Several alternate airfields may be stored in the database and assigned to a destination. When the pilot selects a company route (CO RTE) (or a city pair), the computer strings the preferred alternate into the active flight plan.
The pilot may review the alternate airports on the ALTN page and change the selected one if not suitable.
The ALTERNATE page shows the track and distance (airway or direct) between destination and alternate, as well as fuel management data (EXTRA fuel, assuming the associated airfield is the alternate airport). This data will help the pilot change the preferred alternate, if necessary.

ENTERING NEW ALTERNATE INTO THE F-PLN

SELECT INIT key on the MCDU.
ENTER an AIRFIELD IDENTIFIER in [2L] field.

PRESS FUEL PRED key and CHECK or MODIFY the specified ALTN fuel.

Note: *If weather and destination airfield conditions permit, you may select "NO ALTN". Fuel predictions will be computed without alternate fuel.*

Note: *A new alternate may also be entered in the F-PLN by selection of LAT REV and then ALTN page. In this case, a temporary flight plan will be created before final insertion.*

SELECTION OF ANOTHER ALTERNATE

Fuel management information for flight to another alternate airfield may be obtained by selecting the OTHER ALTN field.

SELECT LAT REV at DESTINATION.
SELECT ALTN [3L].
ENTER the airfield identifier in the brackets.

- If the airfield is not in the database, the NEW RUNWAY page automatically appears.
- If the airfield is in the database and there is a company route (CO RTE) to it, the ROUTE SELECTION page automatically appears.

SELECT the route, as appropriate, or RETURN to the ALTN page.
ENTER the distance in the brackets (if required). XTRA fuel and track (TRK) will appear.
SELECT the other alternate (OTHER ALTN) as a primary alternate, if convenient. (EXTRA fuel and DIST revert to AIRWAY distance).

CHECK and INSERT the TMPY F-PLN, or continue with next revision.

Note:
- *The pilot can always overwrite the "OTHER ALTN". The new "OTHER ALTN" then replaces the previous one, which is lost.*
- *The pilot can select OTHER ALTN as a primary alternate (active flight plan), to replace any alternate on the initial list.*
- *If the pilot selects the other alternate as a primary alternate, and overwrites the OTHER ALTN field by entering a new airport, the first one will remain a primary alternate and the system will memorize a second OTHER ALTN.*

The pilot may enter a distance in the OTHER ALTN field. The system will compute the extra fuel, and the track for this distance.
When the OTHER ALTN is selected as a primary alternate, the FMGC will also compute the predictions for the other alternate.

PREDICTED DATA FOR ALTERNATE

Data predictions can be based on:
- Aircraft weight being equal to landing weight at the primary destination.
- Flight at FL 100 if the alternate F-PLN length is less than 100 NM, at FL 220 if the alternate F-PLN length is comprised between 100 NM and 200 NM, or else at FL 310.
- Cost index 0.
- Constant wind (as entered in the alternate field of the DES WIND page).
- Constant delta ISA (equal to delta ISA at primary destination).
- The along flight plan distance from the destination to the alternate airport.

If the crew enters an ALTN fuel value, this value is the one taken into account.

ENABLE ALTN

Ident.: DSC-22_20-30-10-18-00000479.0002001 / 01 OCT 12
Applicable to: MSN 04827-04860

This enables the flight crew to initiate a diversion by entering the alternate flight plan just after the revision waypoint (with a discontinuity). Using the ENABLE ALTN function results in the creation of a temporary F-PLN. This function has no effect on the active F-PLN until the temporary F-PLN is inserted.
The flight crew may have to adjust the resulting flight plan (add or delete waypoints), depending on the circumstances.

SELECT ②

TO ENABLE THE ALTN F-PLN:

SELECT LAT REV at the waypoint where the ALTN part is to be strung.
PRESS the ENABLE ALTN key

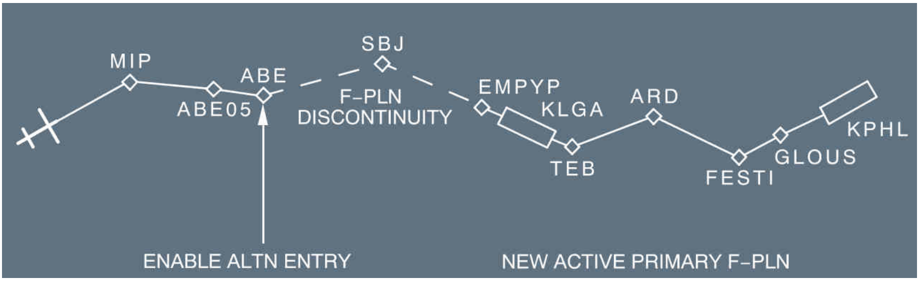
The temporary flight plan is created and displayed.

REVISE the temporary F-PLN as necessary.

INSERT the temporary F-PLN or continue with next revision.

The message “USING COST INDEX 0” is displayed in the scratchpad on the side where the ENABLE ALTN function was used.

If necessary, perform a DIR TO the first waypoint of the alternate.
ADJUST the cost index on the PERF page and the defaulted cruise flight level (CRZ FL) on the PROG page, as required.



When ENABLE ALTN is pressed at ABE, a flight plan discontinuity is created from ABE down to destination and the alternate route is linked to the active flight plan.

DIR KEY (DIRECT-TO-FUNCTION)

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-10-18-F-00000480.0003001 / 30 MAR 18

The pilot uses the “Direct To” function to define a direct leg, potentially with inbound/outbound course or abeam waypoint, from the present position to any waypoint on the active flight plan or to any waypoint.
The designated waypoint may be entered by its identifier (if it is stored in the navigation database), or as a pilot defined element, or by a latitude/longitude, place/bearing/distance, a place-bearing/place-bearing, or a place distance (PD) along the F-PLN.

Note:
1. *If the autopilot or flight director is in the heading/track or localizer mode, the “DIR TO” function engages the NAV mode.*
2. *A lateral revision of the flight plan obtained with a DIR TO may also affect the vertical profile of the flight plan.*

Three functions are available through the DIR TO key:
- DIR TO defines a direct leg from the present position to a specified waypoint.
  NAV mode simultaneously engages upon DIR TO selection.
  When the pilot uses DIR TO, the present position (PPOS) becomes the “FROM” waypoint and the active flight plan shows it as the T-P (turn point)
- The DIR TO/ABEAM function, computes the abeam waypoints along the direct leg. These waypoints are the projection on the direct leg of the initial F-PLN waypoints, located between the aircraft position and the specified waypoint.
  NAV mode simultaneously engages upon DIR TO/ABEAM selection
- The DIR TO/INTCPT function allows the definition of a specified RADIAL INBOUND or OUTBOUND at an inserted waypoint. The current aircraft track is used to compute the INTCPT point with the specified radial.

If the DIR TO waypoint is part of the F-PLN, the FMS computes and proposes a default radial in NAV mode is simultaneously armed upon DIR TO/INTCPT selection.
Using the DIRECT TO function results in the creation of a DIR TO temporary flight plan. This flight plan only reflects the insertion of the direct leg in the active flight plan.
A DIR TO TMPY F-PLN can be deleted with [6L] prompt DIR TO ERASE or inserted [6R] prompt DIR TO INSERT.

With the DIR TO TMPY F-PLN:
- The aircraft continues to follow the active F-PLN until the DIR TO is inserted
- The DIR TO TMPY F-PLN is displayed in yellow on both MCDUs and NDs
- A DIR TO TMPY F-PLN cannot be created when a multi-revisions TMPY F-PLN is already in process.

Note: *In the case a DIR TO/INTCPT is performed:*
- *When the angle between the current aircraft track and the intercept course exceeds 140 °, the transition is not displayed*
- *When the angle between the current aircraft track and the intercept course exceeds 160 °, the interception with the radial is not computed and the message NO NAV INTERCEPT is displayed.*

Note: *As soon as a designated waypoint is entered or selected, the DIRECT TO or DIRECT-TO-WITH ABEAM POINTS function is selected by default, and displayed (in yellow), depending on the Airline option on the AMI file.*
The following examples assume that the activated AMI default option is the “DIRECT TO” function.

Ident.: DSC-22_20-30-10-18-F-00009520.0001001 / 01 OCT 12

PROCEDURE FOR DIR TO WAYPOINT

CASE 1. THE "TO" WAYPOINT IS IN THE FLIGHT PLAN

Example: DIR TO FRZ (with the AMI default DIRECT TO option activated)

PRESS the DIR key on the MCDU.
PRESS the line select key next to “FRZ”.
CHECK that a temporary F-PLN is automatically displayed on both NDs.
INSERT the DIR TO in the active F-PLN.

DISCONTINUITY

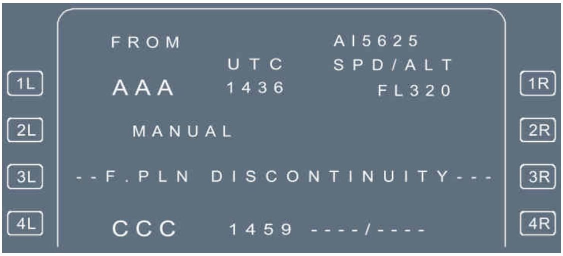
AFTER THE DIR TO

Clear the discontinuity and the waypoints that are not included in the new flight plan.

Ident.: DSC-22_20-30-10-18-F-00009521.0001001 / 05 JUN 18

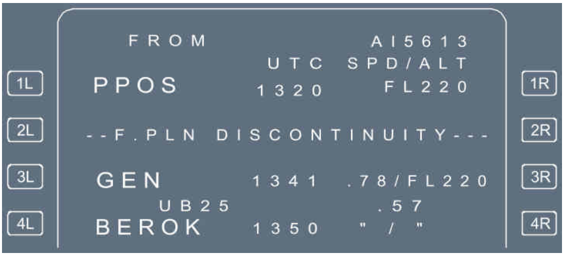
PARTICULAR CASES FOR USE OF DIR TO

- If the pilot is flying a manual leg (part of a SID or STAR), the flight plan page displays “F-PLN DISCONTINUITY”, preceded by “MANUAL” (see below).
  These legs are specific heading or track legs flown with no defined end waypoint.



```
  FROM               AI5625
           UTC      SPD/ALT
  AAA      1436        FL320
    MANUAL
--F.PLN DISCONTINUITY---
  CCC      1459   ----/----
```

- When the pilot encounters a flight plan discontinuity, or if a major reset occurs, the flight plan page displays "PPOS – F-PLN DISCONTINUITY”, and the pilot looses managed guidance in both the lateral and vertical plans.
  The autopilot or flight director reverts to the basic HDG V/S (or TRK FPA) modes. Predictions remain available and are based on the assumption that the aircraft will fly a direct leg from its present position to the next waypoint.



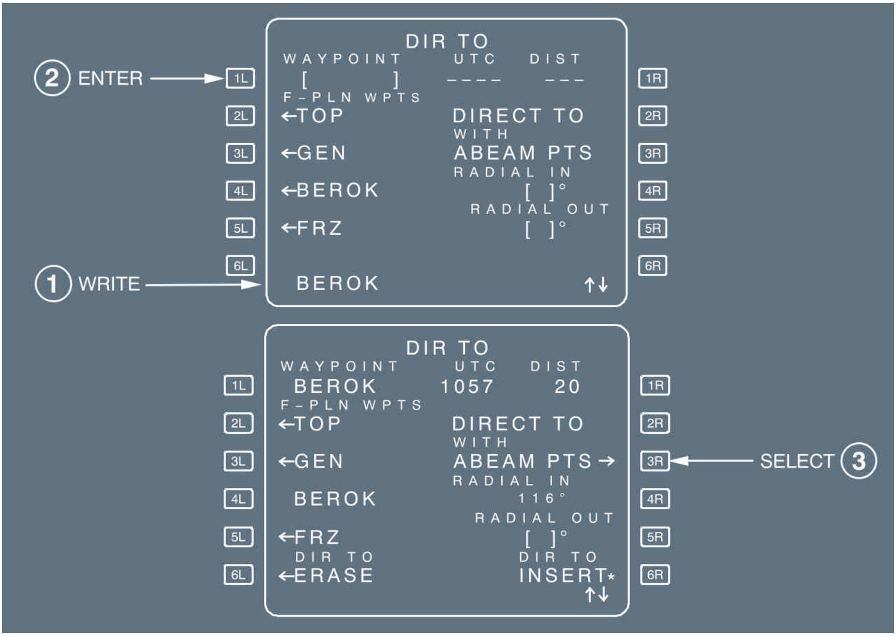
```
    FROM                AI5613
               UTC     SPD/ALT
  PPOS         1320       FL220
 --F.PLN DISCONTINUITY---
  GEN          1341  .78/FL220
       UB25               .57
  BEROK        1350    "  /  "
```

- In both of these cases, the only way to get back to a standard flight plan is to perform a "DIR TO" to a designated waypoint.
- Following a DIR TO, the “MAP PARTLY DISPLAYED” message may appear on the NDs, if the new flight plan includes a very long leg. When this message comes up, enter an intermediate waypoint to shorten the leg.
- If another lateral or vertical revision is attempted, while a DIR TO is pending, the MCDU message “DIR TO IN PROCESS” is displayed.

PROCEDURE FOR DIR TO/ABEAM

Example: DIR TO/ABEAM to BEROK (with the AMI default DIRECT TO option activated).

PRESS the DIR key on the MCDU.
WRITE the waypoint identifier in the scratchpad (Here: BEROK).
PRESS [1L] to enter the waypoint identifier in the WAYPOINT field.
SELECT the ABEAM PTS function, and CHECK that a TMPY F-PLN is displayed on both NDs.
INSERT the temporary F-PLN by pressing the [6R] key.



```

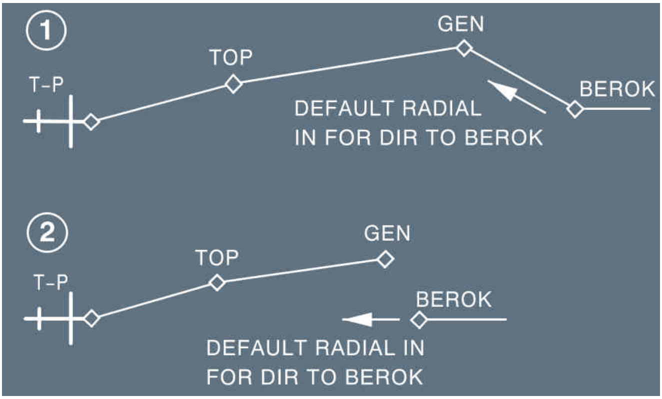
Note: 1. *The DIR TO waypoint is displayed on the top right corner of the ND.*
2. *Abeam waypoints computed from latitude/longitude-type waypoints are renamed by the system as "AB XXXXX", where "XXXXX" is an abbreviation in, 5 characters, of the latitude and longitude of the initial waypoints.*

Ident.: DSC-22_20-30-10-18-F-00009526.0002001 / 01 OCT 12

PROCEDURE FOR DIR TO/INTERCEPT

PRESS the DIR key.
WRITE the waypoint identifier in the scratchpad.
PRESS [1L] to enter the waypoint in the WAYPOINT field.

In the [4R] and [5R] fields, the MCDU displays the functions radial inbound and radial outbound from the waypoint. If the DIR TO waypoint belongs to the flight plan and is not preceded by a discontinuity, the system displays the flight plan track to the DIR TO waypoint as the default inbound radial (figure 1). If the DIR TO waypoint belongs to the flight plan and is preceded by a discontinuity, the system displays the flight plan track from the DIR TO waypoint as the default inbound radial (figure 2).



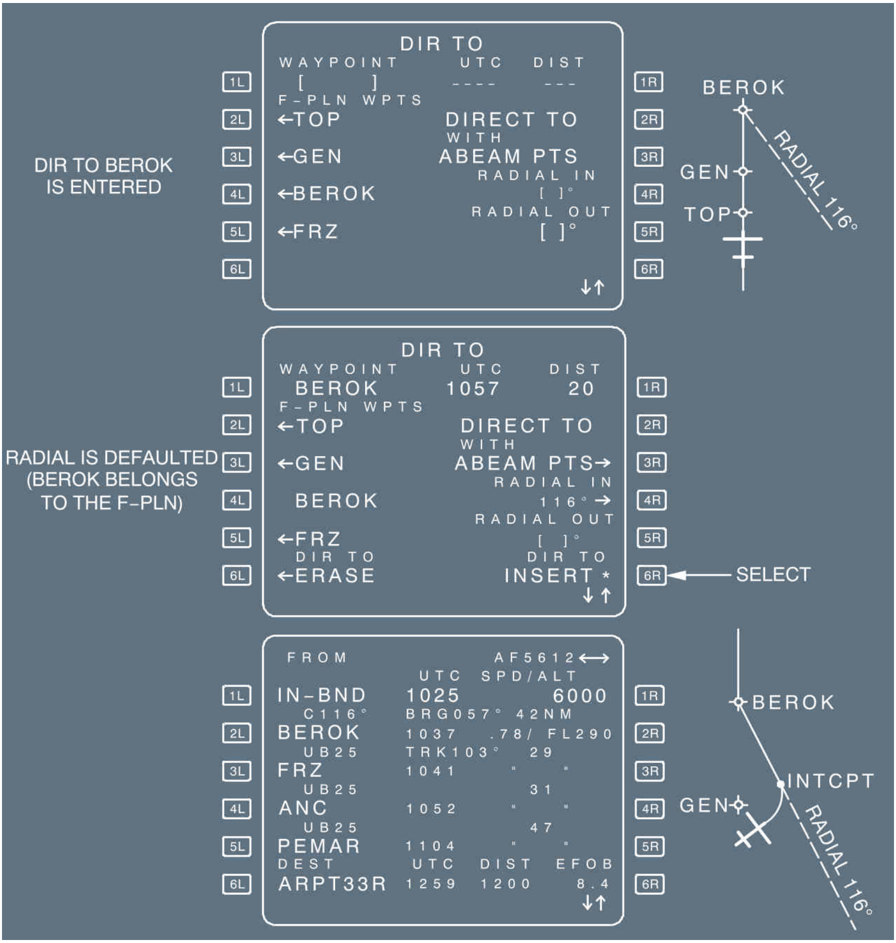
WRITE the required in or out radial in the scratchpad, as necessary.
PRESS [4R] or [5R] to enter the radial in the required field.

The ND displays the temporary F-PLN. The pilot can still modify it:

CHECK and INSERT the DIR TO/INTERCEPT into the active F-PLN by using the [6R] key.
The display reverts to the F-PLN A page, the system arms the NAV mode, and engages the HDG mode. The FROM waypoint is the aircraft position at the time of the DIR TO/INTERCEPT selection. The MCDU indicates it as INBND or OUTBND.

Note:
1. *If the waypoint does not belong to the flight plan, the system strings the DIR TO/INTERCEPT leg to this waypoint, and inserts a discontinuity following the waypoint.*
2. *A DIR TO/INTERCEPT cancels any active offset.*
3. *If the current AP/FD lateral mode is HDG or TRK, NAV becomes armed.*
   If the NAV mode was engaged, NAV becomes armed. FCU HDG or TRK must be used to guide the aircraft.
   The ND displays an intercept point, if the intercept angle is less than 160 °. The system constantly updates it to reflect the current aircraft track and position with respect to the intercept radial. The NAV mode engages when reaching the intercept point.

Example: RADIAL INBND
DIR TO BEROK-RADIAL 116 ° INBOUND



DIR TO BEROK IS ENTERED

OVFY (OVERFLY) KEY

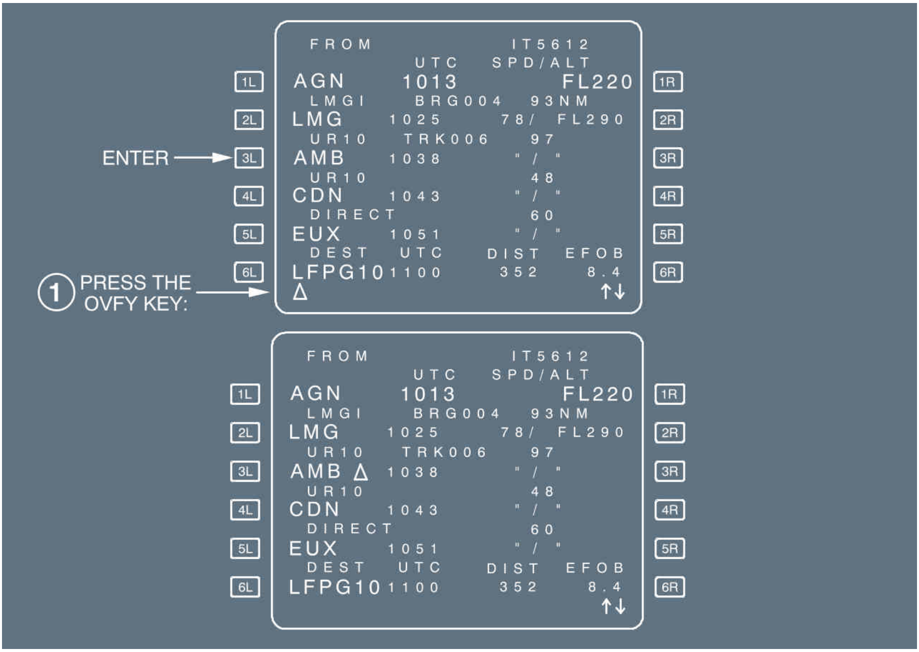
Ident.: DSC-22_20-30-10-18-00000481.0001001 / 01 OCT 12
Applicable to: MSN 04827-04860

The overfly key programs the Flight Management Guidance Computer to fly over a specific waypoint or navaid. Using the overfly function results in the creation of a temporary F-PLN. The function has no effect on the active F-PLN, until the temporary is inserted in the active F-PLN.

PRESS the “OVFY” key.

A “Δ” appears in the scratchpad.

INSERT it, by pressing the key adjacent to the waypoint to be overflown. [3L], in this example.
INSERT the temporary into the active F-PLN.



ENTER
① PRESS THE OVFY KEY:

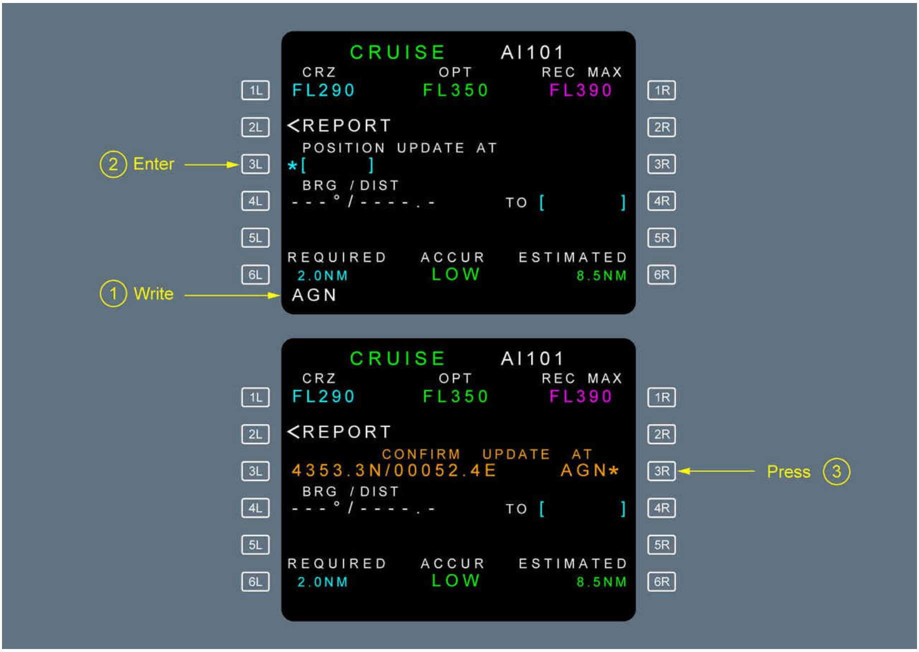
POSITION UPDATE AT

Ident.: DSC-22_20-30-10-18-00000482.0003001 / 04 JUN 19
Applicable to: MSN 04827-04860

To manually change the position computed by the FMGC (FM position and bias), the pilot uses “POSITION UPDATE AT” on the progress page.
<u>Use this function with extreme caution</u> : It is apt to be inaccurate, because it relies on the pilot's estimation of when a designated position has been reached.



```
    CRUISE       AI101
 CRZ       OPT       REC MAX

 BRG / DIST
---°/----.-          TO [       ]

REQUIRED    ACCUR    ESTIMATED
 2.0NM       LOW        8.5NM
```

WRITE the IDENT at which the position update is intended. The identifier format are

- NAVAID
- Waypoint, Airport or runway identifier
- LAT / LONG coordinates
- PLACE BRG / PLACE BRG
- PLACE BRG DIST

Press [3L] to ENTER the IDENT in the “POSITION UPDATE AT” field. The coordinates of the point, along with its identifier (or “ENTRY”, if the identifier is not in the database), appear in that field.

PRESS [3R] to activate the update, when you estimate that you are at the position.

Note: *The system reinitializes the Estimated Position Error computation when a position update is performed. This may lead to the appearance of a "NAV ACCUR DOWNGRAD" or "NAV ACCUR UPGRAD" message.*

If the "POSITION UPDATE AT" does not properly take effect, it corrupts the FM position.

- In an area with good radio NAVAID coverage :
  - If the update error is small, subsequent radio position updating will correct the FM position.
  - If the update error is large, the system will reject any radio updating because its internal "reasonableness test" will reject the various NAVAIDs. Thus, the FM position will only be the MIX IRS position corrected by the position bias, determined at the time of the update, and the error will be maintained.
- In an area without proper NAVAID coverage, radio position updating will not be available and the FM position, if incorrect, will remain incorrect until a new manual update is performed.
- Therefore, the pilot should only use "POSITION UPDATE AT" in case of a major position problem, such as :
  - On the ground, no flight plan appears on the navigation display and ARC/ROSE NAV mode is selected .
  - A "CHECK IRS/FM POSITION" message appears on the MCDU.
  - A "FM/IR POSITION DISAGREE" message appears on the ECAM.

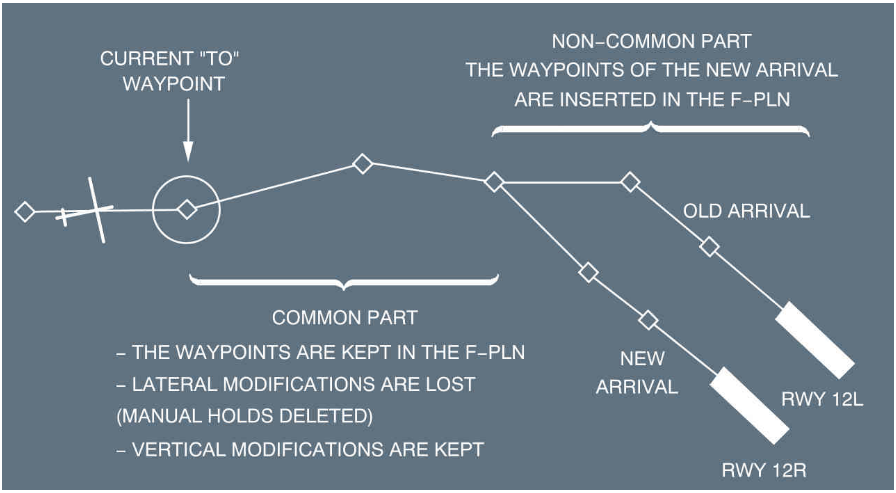
When the GPS PRIMARY ⊲ is operative, the POSITION UPDATE AT is inhibited.

CHANGING THE DEPARTURE/ARRIVAL

Ident.: DSC-22_20-30-10-18-00000483.0003001 / 23 JUN 15
Applicable to: MSN 04827-04860

CHANGING THE ARRIVAL

In approach, the flight crew may be assigned a new arrival procedure or landing runway, while already flying the initially selected arrival. Usually, at that point, the aircraft will still be in a part of the arrival that is common to the old and new procedure. When the new arrival or runway is selected, the FMS strings the remaining part of the new procedure, after the current "TO" waypoint, (see picture below).
All the lateral pilot modifications (including Holds) made to the previous arrival procedure are erased. This includes modifications made to the "TO" waypoint. The vertical pilot modifications (such as speed/altitude constraints) are kept on the waypoints in the common part (including the "TO" waypoint).
If a hold had been inserted in the old arrival procedure, it is deleted and the MCDU displays the "MANUAL HOLD DELETED" message in the scratchpad.



CURRENT "TO"
WAYPOINT
NON-COMMON PART
THE WAYPOINTS OF THE NEW ARRIVAL
ARE INSERTED IN THE F-PLN
OLD ARRIVAL
COMMON PART
- THE WAYPOINTS ARE KEPT IN THE F-PLN
- LATERAL MODIFICATIONS ARE LOST
(MANUAL HOLDS DELETED)
- VERTICAL MODIFICATIONS ARE KEPT
NEW
ARRIVAL
RWY 12L
RWY 12R

The crew should check and revise the TMPY F-PLN , as necessary, prior to inserting the TMPY F-PLN in the active F-PLN.

IF THE CURRENT “TO” WAYPOINT IS NOT COMMON TO THE OLD AND NEW PROCEDURE

Then, the FMS stacks the current active leg, and the entire new arrival procedure as follows:
- The active “TO” waypoint is kept,
- A “F-PLN DISCONTINUITY” is inserted,
- The entire new procedure is strung after the discontinuity.

The crew should check and revise the TMPY F-PLN, as necessary, prior to inserting the TMPY F-PLN in the active F-PLN.

Note: *Depending on the actual progress of the flight, the flight crew may choose the NO STAR and/or NO VIA options on the ARRIVAL page, in order to string only the final part of the approach in the F-PLN.*

CHANGING THE DEPARTURE

If the flight crew changes the departure procedure, the FMS replaces the entire departure procedure by the new selected one .
However, if a lateral modification had been performed within the initially selected departure procedure, the waypoints following the modified waypoint are considered as “en-route” waypoints by the FMS. When a new runway or a new departure is selected, these “en-route” waypoints are kept in the F-PLN, and inserted after the new selected departure.

LATITUDE/LONGITUDE CROSSING WAYPOINT INSERTION

This function enables the crew to insert one or several points along the flight plan beyond the revised waypoint, at fixed latitude or longitude intervals (INCR), from a specified latitude or longitude.
These waypoints can be inserted in the F-PLN, and visualized on the ND. They are part of cruise only. They are not stored in the pilot-defined elements; the system deletes them when sequenced.

WRITE the latitude (NXX or XXN, SXX or XXS) or longitude (EXX, XXE, WXX, XXW), the required increment in degrees between the successive waypoints, and the number of required waypoints.

(Example: If the crew wants to obtain 3 points, at every degree of latitude from N46: Enter N46/1/3).

PRESS [2R] to insert it into the LL XING/INCR/NO field.

PRESS [6R] to insert the new waypoints in the flight plan without discontinuity.

The system does not store these waypoints in the database.

Note: *If one of the obtained waypoints corresponds to an already existing waypoint, it is not inserted.*

General

GENERAL

Ident.: DSC-22_20-30-20-05-00010939.0001001 / 01 OCT 12
Applicable to: ALL

The vertical flight plan is divided into the following flight phases:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.
All but “Preflight” and “Done” phases are associated with speed and altitude profiles.

APPROACH
GO AROUND

Each phase has an assigned profile of target speeds. For each phase the FMGS computes an optimum (ECON) speed as a function of the strategic parameters (CI, CRZ FL, ZFW, ZFWCG, block FUEL) and performance criteria.
ECON speed is the basis of the managed speed profile.

The ECON speed can be modified by:
- Presetting a speed or Mach number on the MCDU (PERF page) for the next phase
- Selecting on the FCU a speed or a Mach number for the active phase
- Inserting speed constraints or speed limits on the MCDU vertical revision (VERT REV) page.

The vertical flight plan includes vertical constraints (altitude, speed, time) that may be stored in the data base or entered manually by the flight crew through vertical revision pages.
The flight crew may also define step climbs or step descents for cruise purposes. If the flight crew plans to climb to a higher flight level or descend to a lower level, they can use a vertical revision at any waypoint to insert the new level.
When all the vertical data has been defined, the FMGC computes the vertical profile and the managed speed/Mach profile from takeoff to landing.

VERTICAL FLIGHT PLANNING

Ident.: DSC-22_20-30-20-05-00011065.0002001 / 17 AUG 10
Applicable to: ALL

DATA ENTRY

The vertical flight plan provides the FMGS with all the data required to calculate performance and predictions. This data is either entered by the flight crew or calculated by the FMS.

There are three categories of data:

- Strategic data, that applies to the overall flight profile:
  - Cost Index (CI)
  - Cruise Flight Level (CRZ FL) and STEP ALTS if any
  - Zero-Fuel Weight (ZFW)
  - Zero-Fuel Weight Center of Gravity (ZFWCG)
  - Block Fuel.
- Weather data:
  - Winds (for climb, cruise, descent, approach)
  - Sea level atmospheric pressure (QNH) at destination
  - Surface temperature (TEMP) at destination
  - Temperature in cruise phase
  - The Tropopause altitude (TROPO).
- Tactical data for the flight phases:
  - Phase switching conditions:
    - Setting of the thrust levers to TOGA or FLEX positions
    - Reaching acceleration altitude (ACCEL ALT)
    - Entering cruise (T/C)
    - Initiation of descent (T/D)
    - Passing a deceleration pseudo waypoint (DECEL PSEUDO WPT)
    - Touchdown.
  - Speed profile:
    - V2
    - Economy climb speed or Mach (ECON CLB SPD/MACH)
    - Preselected speed or Mach (SPD/MACH PRESELECTION)
    - Economy cruise Mach (ECON CRZ MACH)
    - Constant Mach
    - Economy descent Mach or speed (ECON DES MACH/SPD)
    - Approach speed (VAPP).
  - Vertical limitations:
    - Speed limits (SPD LIMIT)
    - Speed and altitude constraints (SPD AND ALT CSTR)
    - Time constraints or Required Time of Arrival (RTA).

In addition to the data entered by the flight crew, the FMS uses some real flight data parameters (CRZ SAT, actual wind) to improve the accuracy of the computed predictions.

FLIGHT PHASES

Ident.: DSC-22_20-30-20-05-00011024.0014001 / 03 NOV 22

1 **Applicable to: MSN 10949-11597**

The vertical flight plan is divided into flight phases. For each phase, the FMS computes the optimum speed or Mach Profile. These flight phases are:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.

FLIGHT PHASES	OPTIMUM SPEED PROFILE	SWITCHING CONDITIONS TO NEXT PHASE
PREFLIGHT *(1)*	/	SRS takeoff mode engaged and N1 is more than 85 % (EPR is more than 1.25) or Ground Speed is more than 90 kt
TAKEOFF	V2 (V2 + 10)	At acceleration altitude or by engagement of another vertical mode.
CLIMB	ECON CLB SPD / MACH	Reaching CRZ FL

CRUISE	ECON CRZ MACH	The flight crew orders a descent below the current CRZ FL while one of the following conditions is applicable:
		- There is no step descent point ahead and
		  - The distance to the T/D is less than 40 NM, or
		  - The distance to destination is less than 200 NM, unless the FMS considers the level change as a step descent. *(2)*
		- All engines are operative and selected altitude below Max [FL 200, highest DES ALT CSTR].

DESCENT	ECON DES MACH / SPD	- Overflying (DECEL) pseudo waypoint with NAV (or LOC*/LOC) mode engaged - Manual activation of the Approach phase.
APPROACH	VAPP (GS Mini)	1. To Go-Around: when thrust levers at TOGA detent, or 2. To Done: 30 s after landing, or 3. To Climb: when inserting a new CRZ FL.

Continued on the following page

Continued from the previous page

FLIGHT PHASES	OPTIMUM SPEED PROFILE	SWITCHING CONDITIONS TO NEXT PHASE
GO-AROUND	VAPP or current SPD, whichever is greater. Green Dot at acceleration altitude	1. To Approach: manual activation of the Approach phase, or 2. To Climb: above acceleration altitude, modification of the destination airport by: - Selection of the ALTN, or - Insertion of a NEW DEST, or - Insertion of a SEC F-PLN with a destination airport different from the destination airport of the active F-PLN.
DONE (3)	/	To Preflight: when INIT or PERF key is pressed.

(1) In the Preflight flight phase, the flight crew inserts the flight plan, and all other data that is necessary for the flight.

(2) If the FMS predicts that the aircraft can reach the selected altitude before the T/D by using the step descent guidance (- 1 000 ft/min V/S), then the FMS considers the level change as a step descent and remains in Cruise phase. Altitude constraints ahead of the aircraft that are at or above the new CRZ FL are ignored and the FMS displays ALT CSTR ABOVE CRZ FL.

(3) In the Done phase, the FMS erases the data entered for the flight. If the Descent or the Approach phase is inadvertently activated (for example by manual activation of the Approach phase), the flight crew may reselect a CRZ FL on the PROG page to reactivate the Cruise phase.

FLIGHT PHASES

Ident.: DSC-22_20-30-20-05-00011024.0011001 / 17 SEP 13
Applicable to: MSN 04827-04860

The vertical flight plan is divided into flight phases. For each phase, the FMGS computes the optimum speed or Mach Profile. These flight phases are:
Preflight - Takeoff - Climb - Cruise - Descent - Approach - Go-Around - Done.

FLIGHT PHASES	OPTIMUM SPEED PROFILE	SWITCHING CONDITIONS TO NEXT PHASE

DONE	/	To preflight: When INIT or PERF key depressed.

Note: *During the preflight phase, the flight crew inserts the flight plan, which includes all data needed for the flight.*
During the Done phase, the FMGC erases the data entered for the flight. If the descent or the approach phase is inadvertently activated (manual approach phase activation, for example), the flight crew may reselect a CRZ FL on the PROG page to reactivate the CRZ phase.

VERTICAL REVISION

Ident.: DSC-22_20-30-20-05-00011025.0002001 / 17 AUG 10

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The flight crew uses vertical revisions to enter or modify:
- The speed limit in the climb and descent phases
- An altitude or speed constraint at the revised waypoint
- A step climb or a step descent
- New wind data
- A time constraint.

The vertical revision page is accessed by pressing a right hand select key of the flight plan page.

VERTICAL REVISION

Ident.: DSC-22_20-30-20-05-00011025.0004001 / 17 AUG 10

Applicable to: MSN 04827-04860

The flight crew uses vertical revisions to enter or modify:
- The speed limit in the climb and descent phases
- An altitude or speed constraint at the revised waypoint
- A time constraint (RTA)
- A Constant Mach value to be kept in cruise
- A step climb or a step descent
- New wind data.

The vertical revision page is accessed by pressing a right hand select key of the flight plan page.

VERTICAL CONSTRAINTS (SPEED, ALTITUDE, TIME)

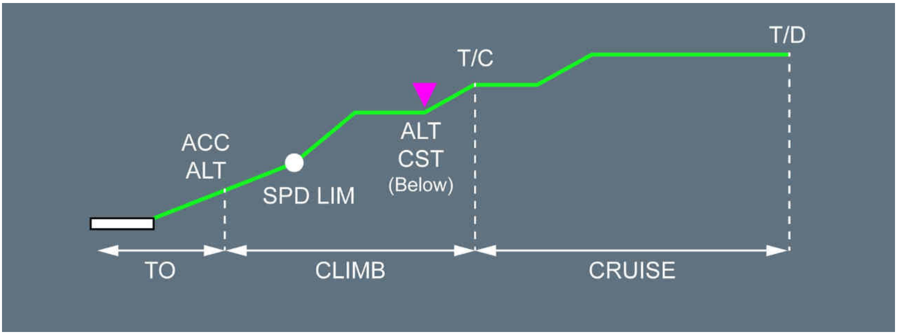
Ident.: DSC-22_20-30-20-05-00012689.0006001 / 05 MAR 19

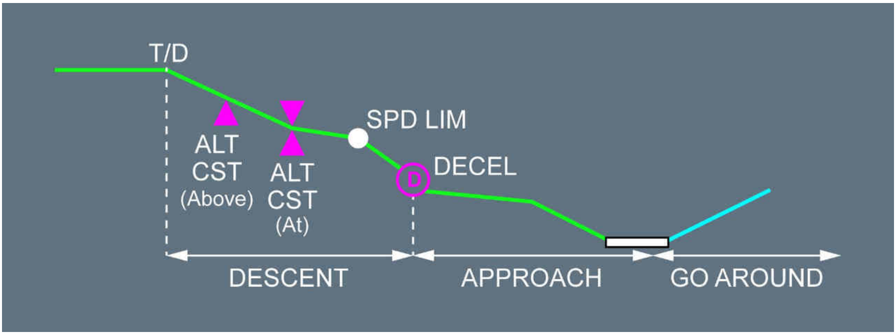
3 **Applicable to: MSN 10949-11597**

The flight crew enters speed, altitude and time constraint. These elements either comply with ATC requests and specified procedures, or with the decision of the flight crew, in response to operational variables.

SPEED LIMIT

A speed limit is associated with altitude as a maximum speed below a specified altitude (only one in climb and one in descent).





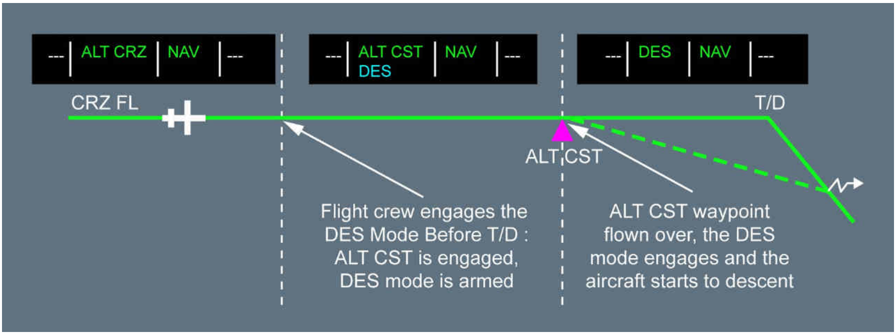
ALTITUDE CONSTRAINT

Specific waypoints may have altitude constraints in climb, descent, or approach phases. To comply with the altitude constraint, the aircraft must fly over the waypoint at an altitude that is equal to, above or below the altitude constraint, as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window. These are the two altitudes between which the aircraft must fly, over a specific waypoint. However, the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB, or DES, or APP NAV-FINAL APP modes.

The FMS automatically engages the ALT CST mode and arms the DES mode until the aircraft fly over the ALT CST waypoint when both of the following apply:
- There is an altitude constraints at the CRZ FL, and
- The flight crew engages the DES mode before the T/D computed by the FMS.

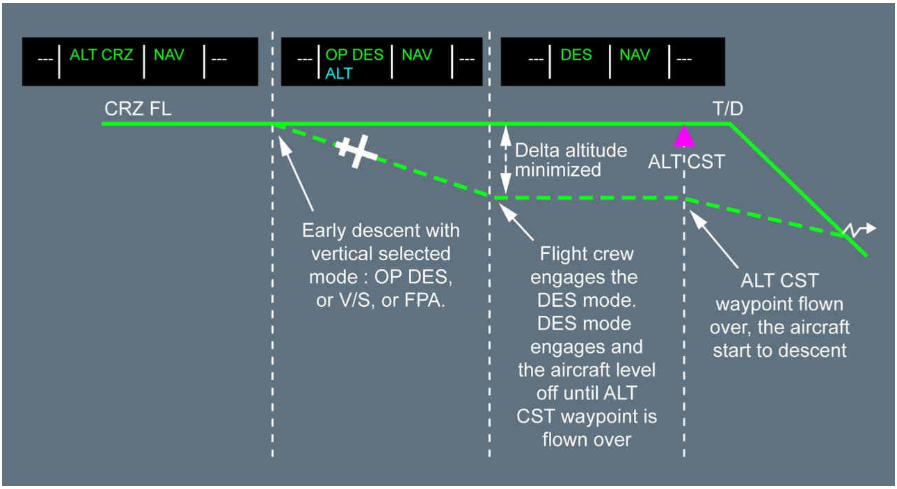


Flight crew engages the DES Mode Before T/D : ALT CST is engaged, DES mode is armed

ALT CST waypoint flown over, the DES mode engages and the aircraft starts to descent

During an early descent performed with a vertical selected mode (OP DES, or V/S, or FPA), the FMS automatically levels off the aircraft, when all of the following apply:
- There is an altitude constraint at the CRZ FL, and
- The aircraft is below the ALT CST, and
- The flight crew engages the DES mode.

The level off is maintained until the ALT CST waypoint is flown over. This enables to minimize the delta altitude between aircraft altitude and ALT CST supposed to be respected at DES engagement:

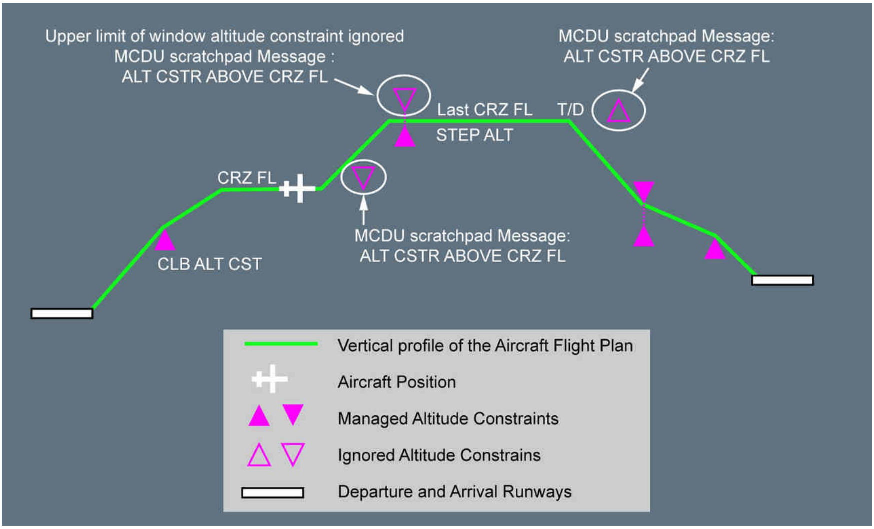


--- | ALT CRZ | NAV | ---
--- | OP DES ALT | NAV | ---
--- | DES | NAV | ---
CRZ FL
T/D
Delta altitude minimized
ALT CST
Early descent with vertical selected mode : OP DES, or V/S, or FPA.
Flight crew engages the DES mode. DES mode engages and the aircraft level off until ALT CST waypoint is flown over
ALT CST waypoint flown over, the aircraft start to descent

IGNORED ALTITUDE CONSTRAINTS:

The FMS automatically disregards all of the following:
- The altitude constraints above CRZ FL (CRZ FL indicated in the FMS PROG page)
- The altitude constraints above the last STEP ALT.

In all these cases, the "ALT CSTR ABOVE CRZ FL" MCDU scratchpad message appears.



Upper limit of window altitude constraint ignored

Aircraft Position
Managed Altitude Constraints
Ignored Altitude Constrains
Departure and Arrival Runways

STEP ALT INSERTION

The FMS automatically prevents STEP ALT insertion, if the STEP DES altitude is below an altitude constraint. The associated "ENTRY OUT OF RANGE" MCDU scratchpad message appears.
The FMS automatically deletes STEP DES, if an altitude constraint is located at or above the STEP DES altitude, even if the altitude constraint is ignored by the FMS. The associated "STEP DELETED" MCDU scratchpad message appears.

SPEED CONSTRAINT

Speed constraints may be attached to specific waypoints in the climb, descent or approach phases. To meet the speed constraint, the aircraft must fly over the waypoint with a speed equal to or less than the speed constraint.
A speed constraint is considered as missed if the system predicts an aircraft speed 10 kt higher than the speed constraint.
Speed constraints are observed when the NAV mode is engaged and the speed target is managed. In other cases, speed constraints are disregarded.

TIME CONSTRAINT

Any waypoint may have time constraints, except the FROM waypoint.

Note: There is no constraint associated to go-around waypoints.

VERTICAL CONSTRAINTS (SPEED, ALTITUDE, TIME)

Ident.: DSC-22_20-30-20-05-00012689.0005001 / 18 FEB 15

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The flight crew enters speed, altitude and time constraint, either to comply with ATC requests and specified procedures, or at the discretion of the flight crew, in response to operational variables.

ALTITUDE CONSTRAINT

Altitude constraints may be attached to specific waypoints in the climb, descent, or approach phases.

To meet the altitude constraint, the aircraft must fly over the waypoint at an altitude equal, above or below the altitude constraint as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window (two altitudes between which the aircraft must fly passing over a given waypoint), but the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB or DES or APP NAV-FINAL modes.

The FMS automatically deletes from the F-PLN:
- The altitude constraints ("AT", "AT OR ABOVE", or "AT OR BELOW") with values greater than the CRZ FL
- The altitude constraint windows with the upper constraint greater than the CRZ FL.

The MCDU and the ND no longer display the deleted altitude constraints. These altitude constraints are no longer used for the computation of the FMS climb and descent profile.
In that case, the scratchpad of the MCDU displays the "CSTR DEL ABOVE CRZ FL" message.
The FMS does not delete the altitude constraints at the CRZ FL. The FMS computes the T/D, in order to respect these altitude constraints. However these altitude constraints are not used for guidance. If the flight crew initiates the descent before reaching the T/D, the aircraft descents below the altitude constraints, and the altitude constraints are missed (amber on the MCDU and on the ND).

SPEED CONSTRAINT

Speed constraints may be attached to specific waypoints in the climb, descent or approach phases. To meet the speed constraint, the aircraft must fly over the waypoint with a speed equal or less than the speed constraint.
A speed constraint is considered as missed if the system predicts an aircraft speed 10 kt greater than the speed constraint.
Speed constraints are observed when NAV mode is engaged and speed target is managed. Otherwise speed constraints are disregarded.

TIME CONSTRAINT

Time constraint may be attached to any waypoint except the "from" waypoint.

Note: *No constraint can be associated with go-around waypoints.*

ALTITUDE CONSTRAINT

Altitude constraints may be attached to specific waypoints in the climb, descent, or approach phases.
To meet the altitude constraint, the aircraft must fly over the waypoint at an altitude equal, above or below the altitude constraint as specified by the flight crew or the database.

Note: *The database may contain an altitude constraint window (two altitudes between which the aircraft must fly passing over a given waypoint), but the flight crew cannot enter such a constraint manually.*

An altitude constraint is considered as missed if the system predicts more than 250 ft of difference between the constraint value and the predicted aircraft altitude.
Altitude constraints are observed in CLB or DES or APP NAV-FINAL modes.

The FMS automatically deletes from the F-PLN:
- The altitude constraints ("AT", "AT OR ABOVE", or "AT OR BELOW") with values equal to the CRZ FL, or greater than the CRZ FL
- The altitude constraint windows with lower constraints equal to the CRZ FL, or greater than the CRZ FL
- The upper constraint of altitude constraint windows with upper constraints equal to the CRZ FL, or greater than the CRZ FL. If the lower constraint of the altitude constraint window is below the CRZ FL, the FMS deletes only the upper constraint of the altitude constraint window and keeps the lower constraint of the altitude constraint window.

The MCDU and the ND no longer display the deleted altitude constraints. These altitude constraints are no longer used for the computation of the FMS climb and descent profile.
In that case, the scratchpad of the MCDU displays the "CSTR DEL ABOVE CRZ FL" message.

SPEED CONSTRAINT

Speed constraints may be attached to specific waypoints in the climb, descent or approach phases. To meet the speed constraint, the aircraft must fly over the waypoint with a speed equal or less than the speed constraint.
A speed constraint is considered as missed if the system predicts an aircraft speed 10 kt greater than the speed constraint.
Speed constraints are observed when NAV mode is engaged and speed target is managed. Otherwise speed constraints are disregarded.

TIME CONSTRAINT

Time constraint may be attached to any waypoint except the "from" waypoint.

Note: *No constraint can be associated with go-around waypoints.*

REQUIRED TIME OF ARRIVAL (RTA)

Ident.: DSC-22_20-30-20-25-A-00009324.0004001 / 26 NOV 19
2 **Applicable to: MSN 10949-11597**

GENERAL

A Required Time of Arrival (RTA) is a time requirement to be met over a specified waypoint of the lateral flight plan, including destination but excluding the origin and FROM waypoints. When the predictions are available, the time constraint value is replaced by the predicted time at the related waypoint, highlighted by a star (*):
- If the RTA is predicted as matched, the star (*) is in magenta
- If the RTA is predicted as missed, the star (*) is in amber.

When a RTA is defined, time constraint is displayed on ND with a 1 s resolution (HH:MM:SS).

Ident.: DSC-22_20-30-20-25-A-00009324.0001001 / 24 JAN 11
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

GENERAL

A Required Time of Arrival (RTA) is a time requirement to be met over a specified waypoint of the lateral flight plan, including destination but excluding the origin and FROM waypoints. When the predictions are available, the time constraint value is replaced by the predicted time at the related waypoint, highlighted by a star (*):
- If the RTA is predicted as matched, the star (*) is in magenta.
- If the RTA is predicted as missed, the star (*) is in amber.

No specific symbol is provided on the ND.
A time constraint is cleared in the same way as any other constraints. If a time constraint is automatically deleted. The MCDU displays an “RTA DELETED” message.

 RTA MISSED AT DEVRO
```

CANCELLATION AND SEQUENCING OF REQUIRED TIME OF ARRIVAL

The time constraint is cleared in the same way as any other constraint:
- On the F-PLN A page, using the CLR key. In this case all constraints on the point will be deleted.
- On the RTA page, using the CLR key.

The time constraint is automatically deleted in the following cases:
- Engine out, or
- When entering a holding pattern, or
- In the case of go-around, or
- A time constraint is entered at another waypoint, while another time constraint already exists, or
- The waypoint associated to the RTA is no more in the flight plan.

Note: *When a previously entered RTA is automatically deleted, the RTA DELETED scratchpad message is displayed.*

When the constrained waypoint is sequenced, the ECON SPD/MACH is resumed unless the constrained waypoint is located in the descent segment (in this case, the RTA speed is kept).

WIND - TEMPERATURE - QNH

Ident.: DSC-22_20-30-20-25-B-00000490.0001001 / 24 JAN 11

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

GENERAL

In order to receive the best predictions, the pilot must enter wind and temperature values for the different phases and for the various waypoints of the cruise phase.
The system uses the temperature value at a given altitude, associated with the tropopause entered on the INIT A page, to optimize the temperature profile.

Ident.: DSC-22_20-30-20-25-B-00009327.0001001 / 24 JAN 11

5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

ENTERING THE TRIP WIND AND TEMPERATURE DURING F-PLN INITIALIZATION

The trip wind is a mean wind component for the entire flight from origin to destination. The pilot can enter it on the INIT B page prior to engine start. It is usually defined by the airline's flight operations on the computerized flight plan.
The FMGS does not consider the trip wind for alternate predictions.
The trip wind is used as long as no winds are entered in the CLB, CRZ, and DES WIND pages.
When the pilot enters a CLB, CRZ or DES WIND, the FMGS disregards the trip wind.

PRESS the INIT key.
INSERT the temperature at cruise FL.
On the INIT B page, INSERT the TRIP WIND.
The trip wind is defined as a headwind component (HDXX, XXHD or –XX), or as a tailwind (TLXX, XXTL or +XX).
The FMGS uses the trip wind to compute preliminary performance, time and fuel predictions.
CHECK the predictions on the F-PLN B page.

Ident.: DSC-22_20-30-20-25-B-00009328.0008001 / 01 MAR 18

6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

ENTERING THE WIND AND TEMPERATURE DURING F-PLN INITIALIZATION

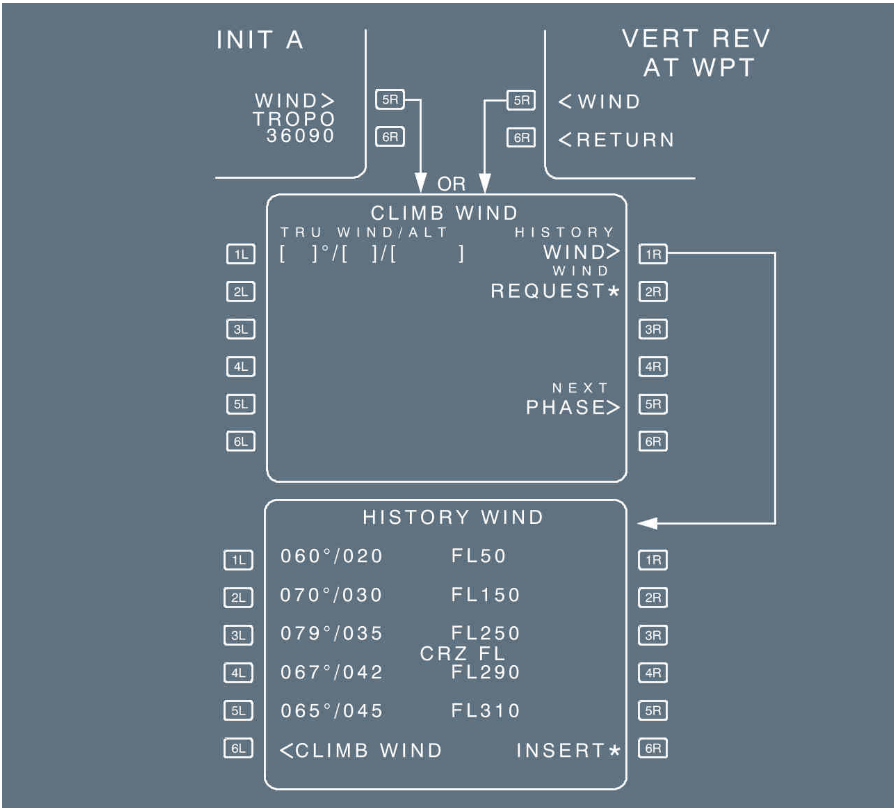
When completing the INIT A page, and once the wind and cruise FL temperature forecasts are available, the pilot may enter them, if significantly different, by pressing the wind prompt.
The pilot will access the different wind pages by using the NEXT PHASE and PREV PHASE prompts. He will slew the CRZ WIND page to access the various cruise wind waypoints.

The pilot will enter wind data as follows:

- For climb phase: By inserting either the HISTORY WIND data (as recorded during the last descent), or by inserting winds (at up to 5 altitudes) on the CLIMB WIND page.
- For cruise phase: By inserting winds (at up to 4 FL) at various CRZ waypoints on the CRZ WIND pages. The 4 levels are the same for all the cruise waypoints. The pilot may enter the temperature of each waypoint and at destination on this page.
- For descent phase: By inserting winds (at up to 5 FL/altitudes) on the DES WIND page.
- For the ALTN F-PLN, an average wind may be entered on the DES WIND page for alternate cruise flight level.

Note: *Wind can be automatically received (and inserted) through the ACARS system.*

Once a CLIMB, CRZ, or DESCENT WIND is entered, the system ignores the TRIP WIND.
Once temperature and winds are inserted, the FMGS computes the ISA profile, and the F-PLN B page displays the forescast wind profile (by linear interpolation and propagation).



INIT A

INSERT*

WIND ENTRY RULES

When a wind entry is performed from an empty field, direction/velocity/altitude (or flight level) must be entered simultaneously. One entry in each bracket.
Overwriting a wind cancels the previous one.
Entered wind data can be cleared: The field reverts to brackets.
Propagated wind cannot be cleared.
Entering a new altitude, over an existing altitude, replaces that existing altitude at all cruise waypoints. Any winds entered at the overwritten altitude are lost at all cruise waypoints.

ENTERING THE HISTORY WIND (F-PLN INITIALIZATION)

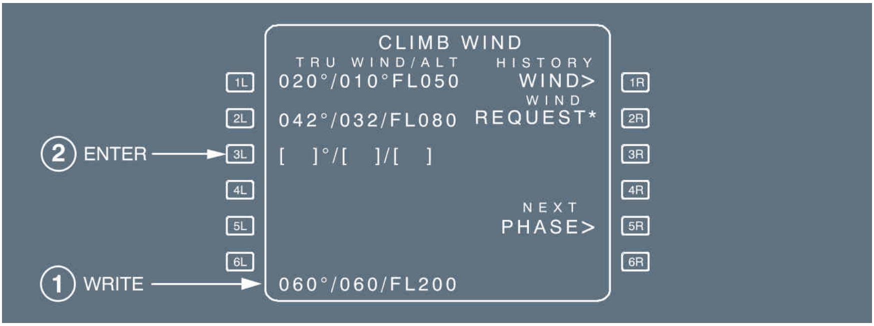
The pilot may insert the history wind, but cannot modify this page.

If convenient, PRESS the (6R) prompt to insert. After insertion, the [6R] prompt is suppressed, but the page still displays the wind values for information.

ENTERING THE CLIMB WIND (F-PLN INITIALIZATION)

If history winds are not convenient:

SELECT CLIMB WIND page from INIT A page or VERT REV page.
WRITE new winds into the scratchpad and ENTER.



```
        CLIMB WIND
 TRU WIND/ALT       HISTORY
020°/010°FL050        WIND>

                     NEXT
                   PHASE>

060°/060/FL200
```

Winds entered on the CLIMB, CRZ, and DESCENT WIND pages are always true north referenced.
Tower wind, entered on PERF APPR page is magnetic-referenced.
The pilot can enter “GRND” in the altitude field for wind at destination.
CLIMB WIND cannot be modified when the climb phase is active.
At climb phase transition, wind data switches from blue to green, and any attempted modification will trigger the “NOT ALLOWED” message.
The system extrapolates the highest wind entry to all higher levels.
The system interpolates winds between 2 entered levels.

ENTERING THE CRUISE WINDS AND TEMPERATURES

At flight plan initialization, the CRZ WIND page displays all cruise waypoints with empty brackets. In flight, only downpath waypoints are displayed.

SELECT VERT REV at WPT.
PRESS the WIND prompt.
SELECT NEXT PHASE.
SLEW until relevant waypoint is displayed.
WRITE and ENTER the new temperature into the scratchpad.
WRITE and ENTER the new wind data into the scratchpad.

WIND and temperature may be entered through the ACARS pages.

The crew will modify the entered winds and temperatures in flight, if a significant difference is expected (greater than 30 kt or 30 ° for the wind data and greater than 5 °C for the temperature). The system propagates the pilot's (or ACARS) wind and temperature entries downpath, until a waypoint for which a different temperature or wind has been entered (for the same flight level), or until the last cruise waypoint.

The forecast winds at a waypoint are determined as follows:
- If the predicted altitude at the waypoint matches an altitude defined in the CRZ WIND page, the forecast wind, is the corresponding entered or propagated wind, displayed at that waypoint on the CRZ WIND page.
- If the predicted altitude lies between two altitudes entered on the CRZ WIND page, the wind direction and velocity are linearly interpolated.
- If the predicted altitude is above or below the set of cruise altitudes, the forecast wind is a constant value extrapolated from the entered or propagated wind at the highest (or lowest) altitude displayed on the CRZ WIND page for that point.

Once in flight, the FMGS considers the actual measured wind up to 200 NM ahead of the aircraft to permanently update the wind profile. This updated wind profile is used to compute the predictions and the performance data, but is not displayed to the crew.

The CRZ WIND pages display the propagated values in small blue font, and the pilot (or ACARS) entries in large blue font.

Note: *The CRZ WIND page displays ACARS or crew-entered or propagated data. It never displays computed data (F-PLN B page only).*

EFFECT OF WIND ENTRIES ON OPTIMUM FLIGHT LEVEL

The OPT FL computation considers the wind entries made at different altitudes (normally at the different CRZ FL).
When flying the subsequent CRZ FL, the OPT FL proposed by the PROG page may be affected by the wind entries made at the previous CRZ FL; these winds are automatically propagated and may be significantly different from the actual winds.
We recommend the following procedure: If the propagated winds at the lower altitudes are significantly different from the actual winds, enter the wind at these altitudes, or if not available, the wind measured at the current CRZ FL.

ENTERING THE ALTERNATE WIND

Alternate wind is entered on the DESCENT WIND page.

The alternate cruise (ALTN CRZ) level defaults to:
- FL 220 if the length of the ALTN F-PLN is less than 200 NM.
- FL 310 if the length of the ALTN F-PLN is greater than 200 NM.

If an alternate wind is not defined, the predictions are computed with a wind defaulted to zero. Alternate wind can be modified at any time.

The alternate wind profile is as follows:

- ALTN CLB wind : Mean wind between ALTN CRZ wind (as entered on the DESCENT WIND page), and the wind at primary DEST (as entered on the PERF APPR page).
- ALTN CRZ wind : If no ALTN WIND has been entered on the DESCENT WIND page, the WIND at primary DEST (as entered on the PERF APPR page) is considered.
  In case no entry is made, zero wind is assumed.
- ALTN DES wind : Mean wind between ALTN CRZ WIND and wind at FL 100.
  Wind at FL 100 = Interpolation between wind at ALTN CRZ FL and zero at ALTN DEST.

CONSTANT MACH SEGMENT

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_20-30-20-25-C-00009334.0001001 / 14 MAY 12

12

GENERAL

The pilot can enter the start and end points of a constant Mach segment, and its associated Mach number, from the VERT REV page.
Only one constant Mach segment may be defined in the active flight plan, and only one in the secondary flight plan. No constant Mach segment can be defined in the alternate flight plan.

Ident.: DSC-22_20-30-20-25-C-00000491.0008001 / 01 OCT 12

13

ENTERING A CONSTANT MACH SEGMENT

SELECT the F-PLN key on the MCDU.
SELECT VERT REV at a waypoint.

(Except the destination and alternate flight plan waypoint).

WRITE the Mach/start waypoint pair.

It is possible to enter only the Mach or the waypoint. But, for the first entry, a Mach entry is mandatory.
The waypoint must be located in front of the aircraft and must be part of the cruise.

ENTER it in the 4L field

The END WPT prompt appears in the 4R field.

TIME CONSTRAINT/RTA

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-20-28-A-00000493.0002001 / 09 FEB 11

GENERAL

A Required Time of Arrival (RTA) is a time requirement to be met over a specified waypoint of the lateral flight plan, including destination but excluding the origin and FROM waypoints.

Once the predictions are available, the time constraint value is replaced by the predicted time at the related waypoint, highlighted by a star (*):
- If the RTA is predicted as matched, the star (*) is in magenta.
- If the RTA is predicted as missed, the star (*) is in amber.

No specific symbol is provided on the ND.
A time constraint is cleared as any other constraints. If a time constraint is automatically deleted, a “RTA DELETED” message is displayed on the MCDU.

Ident.: DSC-22_20-30-20-28-A-00009483.0006001 / 01 OCT 12

TIME CSTR/RTA ENTRY - ENTERING A REQUIRED TIME OF ARRIVAL

SELECT the F-PLN Key on the MCDU.
SELECT a VERT REV at any waypoint.
SELECT the RTA prompt (2R).

The MCDU displays the RTA page.

ENTER the waypoint where the time constraint has to be defined, in the [1L] prompt.

The RTA prompt and the distance indications appear.

CHECK and INSERT the TMPY F-PLN, or continue with next revision

CHECK the 2R and 3R fields to determine whether the entered constraint can be met.

WIND - TEMPERATURE - QNH

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-20-28-B-00009484.0002001 / 09 FEB 11

GENERAL

In order to obtain the best predictions, the crew must enter wind values for the different phases and for various waypoints of cruise phase.
The system uses the temperature value at a given altitude, associated with the tropopause entered on the INIT A page, to optimize the temperature profile.

Ident.: DSC-22_20-30-20-28-B-00009485.0013001 / 01 OCT 12

ENTERING THE TRIP WIND AND TEMPERATURE DURING F-PLN INITIALIZATION

The trip wind is a mean wind component for the entire flight from origin to destination. The crew can enter it on the INIT B page before engine start. It is usually shown on the computerized flight plan.
The FMGS does not consider the trip wind for alternate predictions.
Trip wind function is intended for on-ground predictions only. If it is used for this purpose, the crew should then enter winds on WIND pages prior to departure. In this case, TRIP WIND field on INIT B page will be dashed.

PRESS the INIT key.
INSERT the temperature at CRZ FL (6L field).

This temperature is negative by default. As a consequence, entry of “50” is automatically converted by the FMS into “-50”.

On the INIT B page, INSERT the TRIP WIND (5R field).

The trip wind, is defined as a headwind component (HDXX, XXHD or - XX), or as a tailwind (TLXX, XXTL or + XX).
The FMGS uses the trip wind to compute preliminary performance, time and fuel predictions.

ENTERING THE WIND AND TEMPERATURE DURING F-PLN INITIALIZATION

When completing the INIT A page, and once the wind and cruise FL temperatures forecasts are available, the crew can enter them, if significantly different, by pressing the wind prompt.
The crew accesses the various WIND pages by using the NEXT PHASE and PREV PHASE prompts. They can slew the CRZ WIND page to access the various wind values at each cruise waypoints.

The crew can enter wind data as follows:
- For climb phase: By inserting either the HISTORY WIND data (as recorded during the last descent), or by inserting winds (at up to 5 altitudes/FL) on the CLIMB WIND page
- For cruise phase: By inserting winds (at up to FL 4) at various CRZ waypoints on the CRZ WIND pages. The 4 levels are the same for all the cruise waypoints. The crew may enter the temperature at each waypoint on this page

- For descent phase: By inserting winds (at up to FL 5 /altitudes) on the DES WIND page
- For the ALTN F-PLN, an average wind may be entered on the DES WIND page for alternate cruise flight level.

Note: *Wind can be automatically received (and inserted) via the ACARS system. Refer to DSC-22_20 Auto Flight - Flight Management / 70 AOC Functions / B Wind Data / Wind Data - Request for Wind Data.*

Once a CLIMB, CRZ, or DESCENT WIND is entered, the system ignores the TRIP WIND. Once temperature and winds are inserted, the FMGS computes the ISA profile, and the F-PLN B page displays the forescast wind profile (by linear interpolation and propagation).

WIND ENTRY RULES

When a wind entry is performed from an empty field, direction/velocity/altitude (or flight level) must be entered simultaneously. One entry in each bracket.
Overwriting a wind cancels the previous one. Entered wind data can be cleared: The field reverts to brackets.
Propagated wind cannot be cleared.
Entering a new altitude, over an existing altitude, replaces that existing altitude at all cruise waypoints. Any winds entered at the overwritten altitude are lost at all cruise waypoints.

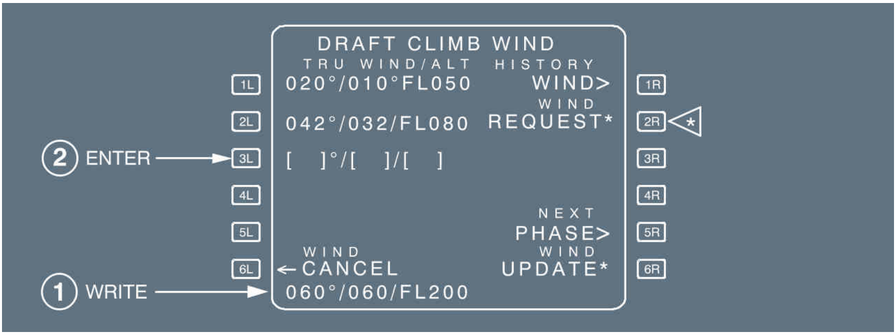
ENTERING THE HISTORY WIND (F-PLN INITIALIZATION)

The crew may insert the history winds, but cannot modify this page.

- **If convenient,** PRESS the (6R) prompt on the HISTORY WIND page to insert them. After insertion, the [6R] prompt is suppressed, but the page still displays the wind values for information.

ENTERING THE CLIMB WIND (F-PLN INITIALIZATION)

- **If history winds are not convenient:**
  SELECT CLIMB WIND page from INIT A page or VERT REV page.
  WRITE new winds in the scratchpad and ENTER them in the empty fields.



```
        DRAFT CLIMB WIND
 TRU WIND/ALT    HISTORY

 WIND               WIND
←CANCEL          UPDATE*
060°/060/FL200
```

PRESS WIND UPDATE [6R] to insert the winds.
"DRAFT" disappears and the wind data become blue.

The crew can enter "GRND" in the altitude field to specify the wind at ground level, at the departure airport.
CLIMB WIND cannot be modified when the climb phase is active.
At climb phase transition, wind data switches from blue to green colour and any attempted modification will trigger the "NOT ALLOWED" message.

The system interpolates winds between 2 entered levels.

ENTERING THE CRUISE WINDS AND TEMPERATURE

A flight plan initialization, the CRZ WIND page displays all cruise waypoints with empty brackets. Until predictions are available, all the waypoints not being part of a SID, STAR or approach are considered as cruise waypoints. In flight only downpath waypoints are displayed.

SELECT INIT or VERT REV at WPT.
PRESS the WIND DATA prompt.
SELECT NEXT PAGE, to reach the CRZ WIND page.

For each desired waypoint:

SCROLL until the waypoint is displayed.
WRITE the new temperature and altitude in the scratchpad, and ENTER it.

WRITE the new wind data and altitude in the scratchpad, and ENTER IT

WIND and temperature may be entered through the ACARS pages. Refer to DSC-22_20 Auto Flight - Flight Management / 70 AOC Functions / B Wind Data / Wind Data - Request for Wind Data..

Then, when wind update is complete for all these waypoints:

PRESS the UPDATE INSERT prompt.

The wind profile is updated and predictions are re-computed only once this prompt is pressed.

The crew should modify the entered winds and temperatures in flight, if a significant difference is expected (greater than 30 kt or 30 ° for the wind data and greater than 5 °C for the temperature). The FMS propagates the crew (or AOC) wind and temperature entries downpath, until a waypoint for which a different temperature or wind has been entered (for the same flight level), or until the last cruise waypoint.

The forecast winds at a waypoint are determined as follows:

- If the predicted altitude at the waypoint matches an altitude defined in the CRUISE WIND page, the forecast wind is the corresponding entered or propagated wind, displayed at that waypoint on the CRUISE WIND page
- If the predicted altitude lies between two altitudes entered on the CRUISE WIND page, the wind direction and velocity are linearly interpolated
- If the predicted altitude is above or below the set of CRUISE altitudes, the forecast wind is a constant value extrapolated from the entered or propagated wind at the highest (or lowest) altitude displayed on the CRUISE WIND page for that waypoint.

The CRUISE WIND pages display the propagated values in small cyan font, and the crew (or AOC) entries in large cyan font.

Note: *The CRUISE WIND page displays AOC data, crew-entered data or propagated data. It never displays computed data (displayed on the F-PLN B page only).*

EFFECT OF WIND ENTRIES ON OPTIMUM FLIGHT LEVEL

The OPT FL computation considers the wind entries made at different altitudes (normally at the different CRZ FL).
When flying the subsequent CRZ FL, the OPT FL proposed by the PROG page may be affected by the wind entries made at the previous CRZ FL; these winds are automatically propagated and may be significantly different from the actual winds.
We recommended the following procedure:

- **if the propagated winds at the lower altitudes are significantly different from the actual winds, enter the wind at these altitudes, or if not available, the wind measured at the current CRZ FL.**

Ident.: DSC-22_20-30-20-28-B-00009489.0021001 / 14 MAY 12

ENTERING THE DESCENT WINDS

The crew will enter as many as one wind at 5 different FL or altitudes. This wind data will be used for descent profile and prediction computation.
From the vertical revision page, or from the CRUISE WIND page:

PRESS the WIND prompt.
SELECT the DESCENT WIND page.
ENTER up to 5 different "wind/altitude".

When the winds have been entered, the F-PLN B page displays the forecast wind profile at all descent waypoints using values it has interpolated from manual entries. Descent winds are not modifiable when descent, approach or go around phase is active. At descent phase transition, wind data changes color from blue to green and any attempted modification triggers the “NOT ALLOWED” message.

Ident.: DSC-22_20-30-20-28-B-00009490.0001001 / 09 FEB 11

ENTERING THE ALTERNATE WIND

Alternate wind is entered in the DESCENT WIND page. The altitude is blanked if no alternate destination is defined.

- **If an alternate wind is not defined, the predictions are computed with a wind defaulted to zero.**

Alternate wind can be modified at any time.

Ident.: DSC-22_20-30-20-28-B-00009491.0021001 / 14 MAY 12

ENTERING THE APPROACH WIND

The wind at destination is entered on the PERF APPR page, [3L] field. It is a magnetic referenced wind, copied in true reference into DESCENT WIND page at ground level (GRND) and F-PLN B page at destination. A ground entry on the DESCENT WIND page is in the same way, copied to F-PLN B page and PERF APPR page (Magnetic) automatically. This wind is modifiable in descent and approach and go-around phase.

SELECT the PERF key on the MCDU
PRESS the NEXT PHASE key [6R], to reach PERF APPR page.
WRITE the surface wind (magnetic) in the scratchpad and ENTER it in the [3L] field.

CONSTANT MACH

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-30-20-28-C-00009492.0006001 / 09 FEB 11

GENERAL

The crew can specify a part of the F-PLN to be flown at a given Mach value, using the Constant Mach function.
Only one Constant Mach segment may be defined in the active or temporary flight plan, and one in the secondary flight plan. No Constant Mach segment can be defined in the alternate flight plan.

Ident.: DSC-22_20-30-20-28-C-00009493.0006001 / 14 MAY 12

ENTERING A CONSTANT MACH SEGMENT

SELECT the F-PLN key on the MCDU.
SELECT VERT REV at any cruise waypoint.
SELECT the CONSTANT MACH prompt [4L], to access the CONSTANT MACH page.
ENTER the desired Mach value in the [1L] field.
SELECT the Start waypoint [2L] and End waypoint [2R] within the list of selectable waypoint (3L → 5L, 3R → 5R, “SELECTABLE F-PLN WPTS”).

When accessing the CONSTANT MACH page, the Start waypoint is defaulted to the first downpath waypoint at which a CMS can be entered. The End waypoint is defaulted to the Top of Descent (T/D).

CHECK and INSERT the TMPY F-PLN, or continue with next revision.

OPTIMIZATION

Ident.: DSC-22_20-40-10-00011084.0029001 / 23 JUN 15
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The FMGC minimizes cost by optimizing the following items:
- Takeoff, approach, and go-around speeds (F, S, Green Dot, VAPP)
- Target speed for CLB, CRZ and DES phases (ECON SPD/MACH)
- Flight Level (for flight crew's information)
- Descent profile from CRZ FL down to the destination airport.

These items depend on the data the flight crew inserts during lateral and vertical flight planning and revision procedures.
Most are displayed on the PERF pages associated with the appropriate flight phases.

WIND PROFILE

To obtain the best predictions, the flight crew must enter the wind for the various flight phases and specifically for waypoints in cruise.

- **ON GROUND:**
  During flight planning initialization, enter the winds for the climb and cruise phases using the HISTORY WIND and WIND pages. Enter, manually or with ACARS, different wind values in the climb and cruise phases. The system will compute a wind for all waypoints of the F-PLN using linear interpolation between manual/ACARS entries.
  The wind profile will be displayed on the F-PLN B page, and is called forecast wind profile. Flight crew or ACARS entries are displayed in large font, and system-computed winds in small font.
- **IN FLIGHT:**
  The system updates the predictions and the current ECON speed, using the measured wind at the present position. It combines actual wind and forecast winds to compute the wind ahead of the aircraft, but this is totally transparent to the flight crew.
  During cruise, the flight crew will enter the descent winds and the approach wind. The system will update the final predictions, compute the optimum descent profile and compute the optimum speed in descent and approach.

The forecast wind profile will be used to compute fuel and time predictions, as well as ECON speed/Mach targets.

OPTIMUM TAKEOFF, APPROACH AND GO-AROUND SPEEDS

The FMGC computes takeoff speeds (F, S, Green Dot) during the preflight and takeoff phases, using the performance model in the database and the takeoff weight.
The flight crew has to insert V1, VR, and V2 in the PERF TO page manually.
The FMGC uses the performance model and either the predicted landing weight or the current gross weight at transition to the approach phase to compute approach speeds (VLS, VAPP, F, S, Green Dot).
On the PERF APPR page, the selected LDG CONF determines the applicable VLS and VAPP, the latter being updated by the WIND correction that the flight crew enters on the same page. The FMGC uses the performance model and gross weight to compute go-around speeds (F, S, Green Dot).

OPTIMUM TARGET SPEED FOR CLIMB, CRUISE AND DESCENT (ECON SPD/MACH)

The FMGS computes the optimum target speed (ECON SPD/MACH) as a function of:
- Cost index (CI)
- Cruise flight level (CRZ FL)
- Gross weight (GW)
- Wind and temperature models
- Performance factor.

The computer processes the ECON SPDs for the climb and descent phases before the initiation of the flight phase, and freezes the values once the flight phase becomes active.
When there is no time or speed constraint/limit, ECON SPEED is the optimum speed for the selected cost index. It refers to fuel and time cost and not directly to fuel saving.
The FM calculates ECON CLB, ECON DES and the associated top of climb and top of descent as a function of cost index, cruise FL, and meteo data.

The computer continually updates ECON CRUISE MACH (SPD), taking into account current weather conditions and modifications to the flight plan.

Note: *If the cruise FL is below FL 250, ECON CRUISE SPEED is computed.*
If the cruise FL is above FL 250, ECON CRUISE MACH is computed.

```

CLIMB PHASE ACTIVE

The active mode field changes from MANAGED to SELECTED, and the FM will use the entered speed for climb predictions computation.
The flight crew can revert to managed mode by pressing the 3L key.

PRESET TARGET SPEED/MACH FOR DES PHASE

The flight crew can change the speed and/or Mach displayed in the MANAGED field by inserting a speed and/or Mach in the MANAGED field.
Although the entered speed is chosen by the flight crew, the FMGS uses it to compute the descent flight path and top of descent. It is therefore part of the managed descent profile.

OPTIMUM
FLIGHT LEVEL

The optimum flight level (OPT FL) indicates the most economic flight level for a given cost index, weight, weather data. It is continuously updated in flight. It requires a 5 min minimum cruise time, at a minimum cruise flight level of FL 100.

The OPT FL is a compromise between fuel and time saving. As a result, the flight crew may observe jumps in OPT FL due to GW, ISA, or wind changes. The computation of the OPT FL considers the wind entries made at the different altitudes (normally at the different CRZ FL). When flying the subsequent CRZ FL, the OPT FL proposed by the PROG page may be affected by the wind entries made at the previous CRZ FL; these winds are automatically propagated and may be significantly different from the actual winds.

Note: *For simplification purposes, the FCOM/QRH gives the OPT FL at a given Mach number. It does not consider the cost index, therefore the FMGS and the FCOM/QRH values are different.*

FM displays OPT FL on the PROG page. The PROG page displays dashes for this quantity when the system detects an engine-out condition.

OPTIMUM DESCENT PATH

The vertical flight path is computed to minimize fuel consumption, while satisfying the various altitude constraints of the F-PLN and the descent speed profile, in order to reach VAPP at 1 000 ft.

The computer calculates the descent profile before the descent phase is initiated, taking into account:

- All lateral and vertical flight plan data
- The descent and approach winds, as inserted into the DESCENT WIND page and PERF APPR page, and the required maximum cabin rate of descent.

During descent, the descent profile is updated only if the flight plan is modified, or if data for the APPR phase (WIND, VAPP, or LDG CONF) are changed.

OPTIMIZATION

Ident.: DSC-22_20-40-10-00011084.0038001 / 23 JUN 15
Applicable to: MSN 04827-04860

The FMGC minimizes cost by optimizing the following items:

- Takeoff, approach, and go-around speeds (F, S, Green Dot, VAPP)
- Target speed for CLB, CRZ and DES phases (ECON SPD/MACH)
- Flight Level (for flight crew's information)
- Descent profile from CRZ FL down to the destination airport.

These items depend on the data the flight crew inserts during lateral and vertical flight planning and revision procedures.
Most are displayed on the PERF pages associated with the appropriate flight phases.

WIND PROFILE

To obtain the best predictions, the flight crew must enter the wind for the various flight phases and specifically for waypoints in cruise.

■ **ON GROUND:**
During flight planning initialization, enter the winds for the climb and cruise phases using the HISTORY WIND and WIND pages. Enter, manually or with AOC, different wind values in the climb and cruise phases. The system will compute a wind for all waypoints of the F-PLN using linear interpolation between manual/AOC entries.
The wind profile will be displayed on the F-PLN B page, and is called forecast wind profile.
Flight crew or AOC entries are displayed in large font, and system-computed winds in small font.

■ **IN FLIGHT:**
The system updates the predictions and the current ECON speed, using the measured wind at the present position. It combines actual wind and forecast winds to compute the wind ahead of the aircraft.
During cruise, the flight crew will enter the descent winds and the approach wind. The system will update the final predictions, compute the optimum descent profile and compute the optimum speed in descent and approach.

The forecast wind profile will be used to compute fuel and time predictions, as well as ECON speed/Mach targets.

OPTIMUM TAKEOFF, APPROACH AND GO-AROUND SPEEDS

The FMGC computes takeoff speeds (F, S, Green Dot) during the preflight and takeoff phases, using the performance model in the database and the takeoff weight.
The flight crew has to insert V1, VR, and V2 in the PERF TO page manually.
The FMGC uses the performance model and either the predicted landing weight or the current gross weight at transition to the approach phase to compute approach speeds (VLS, VAPP, F, S, Green Dot).
On the PERF APPR page, the selected LDG CONF determines the applicable VLS and VAPP, the latter being updated by the WIND correction that the flight crew enters on the same page. The FMGC uses the performance model and gross weight to compute go-around speeds (F, S, Green Dot).

OPTIMUM DESCENT PATH

The vertical flight path is computed to minimize fuel consumption, while satisfying the various altitude constraints of the F-PLN and the descent speed profile, in order to reach VAPP at 1 000 ft.

The computer calculates the descent profile before the descent phase is initiated, taking into account:
- All lateral and vertical flight plan data
- The descent and approach winds, as inserted into the DESCENT WIND page and PERF APPR page, and the required maximum cabin rate of descent.

During descent, the descent profile is updated only if the flight plan is modified, or if data for the APPR phase (WIND, VAPP, or LDG CONF) are changed.

Intentionally left blank

COST INDEX (CI)

Ident.: DSC-22_20-40-20-00011041.0001001 / 17 AUG 10
Applicable to: ALL

The cost index is a fundamental input for the ECON SPEED or ECON MACH computation. ECON SPEED and ECON MACH reduce the total flight cost in terms of flight time and fuel consumption (and not only in terms of fuel saving).
CI is the ratio of flight time cost (CT) to fuel cost (CF).
CI = CT/CF (kg/min or 100 lb/h).
CI = 0 corresponds to minimum fuel consumption (Max Range).
CI = 999 corresponds to minimum time.
CI = Long Range Cruise (*Refer to PRO-NOR-SRP-01-50 Preparation for Descent and Approach - Cost Index for Long-Range Cruise*).

Note: *The airline's operations department usually defines the cost index, to optimize each company route. The flight crew does not ordinarily modify the cost index during a flight.*

Intentionally left blank

GENERAL

Ident.: DSC-22_20-40-30-00011080.0002001 / 17 AUG 10
Applicable to: ALL

The FMGC computes predictions for the primary and secondary flight plans and displays them on the Multipurpose Control and Display Units (MCDUs), and on the navigation display (ND) of the Electronic Flight Instrument System (EFIS).
The computations use the current state of the aircraft (GW, CG, position, altitude, speed, engaged mode of the autopilot or flight director, time, wind, temperature) for the active flight plan.
The computations use data entered by the flight crew for the secondary flight plan when it is not a copy of the active flight plan. When the secondary flight plan is a copy of the active flight plan, it uses the same data.

PREDICTIONS FOR THE PRIMARY FLIGHT PLAN

Ident.: DSC-22_20-40-30-00011085.0001001 / 17 AUG 10
Applicable to: ALL

The predictions displayed on the MCDU assume that the FMGS will guide the aircraft along the preplanned lateral and vertical flight plans.
The predictions displayed on the ND assume that the aircraft will continue to operate in the modes (selected or managed) that are currently active.
As long as the aircraft is flying the flight plan under managed guidance, the predictions on the MCDU will match those on the ND.

If the flight crew does not fly the flight plan, the MCDU predictions assume that:
- The flight crew will fly back towards the flight-planned route
- The flight crew will immediately resume flying the FMGC managed modes.

If the flight crew does not fly the managed speed profile, the MCDU predictions assume that they will maintain the selected speed until they reach:
- In the climb or descent phase, the next speed limit or speed constraint if any, or next phase
- In cruise, the top of descent.

Then, the predictions assume that the flight crew will revert to managed speed.

COMPUTATION OF PREDICTIONS

Ident.: DSC-22_20-40-30-00011086.0001001 / 17 AUG 10

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The system calculates various predictions for the active flight plan and updates them continually during flight as functions of:

- Revisions to the lateral and vertical flight plans
- Cost index
- Current winds and temperature
- Present position versus lateral and vertical flight plans
- Current guidance modes
- Speed control (managed/selected).

The MCDU and the ND show these predictions, each of which is based on specific assumptions.

Note: *During computation, prediction fields on the MCDU pages display dashes.*

COMPUTATION OF PREDICTIONS

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

These predictions consist of symbols positioned along the lateral flight plan (NAV mode engaged) or the track line (NAV mode not engaged). These symbols (named as pseudo waypoints) and their meanings are:

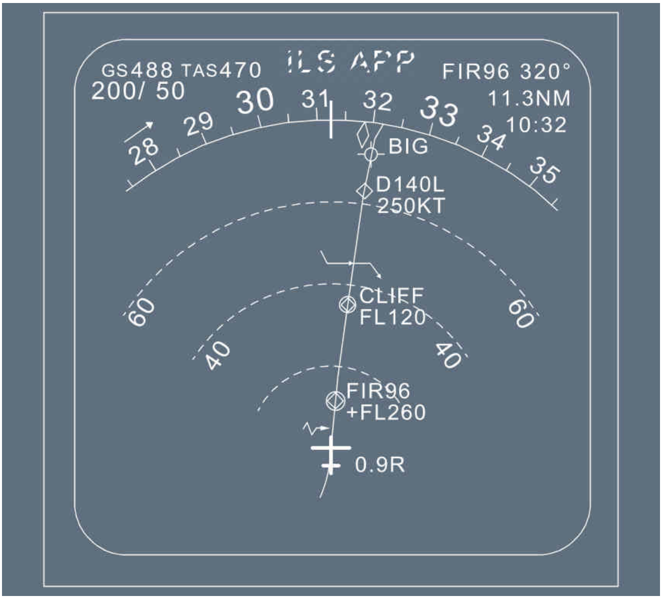
Pseudo waypoint	**Definition**
↗ ↘	Level symbol at the position (top of climb or level-off) where the aircraft will reach: - The FCU selected altitude (blue) or - The constrained altitude, if it is more restrictive than the FCU altitude and if appropriate modes are engaged (magenta).
↘	Top of descent or continue descent symbol: - Top of descent (always white) - Continue descent symbol (white if DES is not armed, blue if it is).
↗	Start of CLIMB symbol: - White if CLB is not armed - Blue if CLB is armed.
∿	Intercept point symbol: The point where the aircraft is predicted to intercept the descent path, if there is any vertical deviation when the aircraft is in DES mode (white if DES is not engaged, blue if it is).
•	Speed change symbol: The point at which the aircraft will initiate an automatic ACCEL or DECEL from current speed to a new computed speed if it encounters a SPD LIM, SPD CSTR, or HOLDING SPD (magenta).
Ⓓ	Decelerate point symbol: - Indicates the point at which the aircraft is predicted to decelerate for approach (and thus switch to the approach phase) - Magenta, if in managed speed and NAV or approach mode is engaged - White, if in selected speed or HDG/TRK mode - Automatic deceleration only occurs when displayed in magenta.
○	ALT CSTR symbol set around the constrained waypoint: - Magenta, when the ALT CSTR is predicted to be met - Amber, when the ALT CSTR is predicted to be missed - White, when the ALT CSTR is not taken into account by the FMGS, and the NAV mode is engaged.
○ (10 45) ○ (ETP)	Time marker and equitime point symbols appear in green to indicate where the aircraft reaches the time marker or equitime point.

Continued on the following page

Continued from the previous page

Pseudo waypoint	Definition
◠	Energy circle symbol (green arc) centered on the aircraft position and oriented to the current track line. Represents the Required Distance to Land. Only displayed if the lateral guidance mode is heading or track, and the current FMS flight phase is in cruise, descent or approach, and the aircraft is within 180 NM of the destination.
Crosstrack error XX.XR or XX.XL (X is a number)	The crosstrack error displays the lateral deviation between the aircraft position and the track of the F-PLN active leg. The value is limited to 99.9 NM left or right.
INTCPT	Intercept waypoint is displayed on the ND at the point at which the present track intercepts the F-PLN.

The predicted time of arrival at the TO WPT is located in the upper right-hand corner of the ND. It assumes direct distance from the aircraft position to the TO WPT and assumes current ground speed will be constant.



As a general rule, the ND indicates what the aircraft will fly, with the current active FG modes.

For example:
- The continuous green line on the ND represents the track the aircraft is currently flying:
  - If HDG/TRK is engaged, the track line is green and the flight plan is dashed
  - If NAV mode is engaged, the green line is the flight plan.
- If the speed target is manually selected, the speed-change symbol is no longer displayed because it will not be taken into account.
- When the aircraft is not following the vertical flight plan (OP CLB, OP DES, V/S) but the NAV mode is engaged, the system disregards any altitude constraints and puts white circles around the waypoints that have these constraints and positions level symbols accordingly.
- Pseudo waypoints are adjusted each time predictions are updated.

PREDICTIONS DISPLAYED ON THE NAVIGATION DISPLAY

Ident.: DSC-22_20-40-30-00011090.0004001 / 20 JAN 15
Applicable to: MSN 04827-04860

These predictions consist of symbols positioned along the lateral flight plan (NAV mode engaged) or the track line (NAV mode not engaged). These symbols (named as pseudo waypoints) and their meanings are:

Pseudo waypoint	Definition
	Level symbol at the position (top of climb or level-off) where the aircraft will reach: - The FCU selected altitude (blue) or - The constrained altitude, if it is more restrictive than the FCU altitude and if appropriate modes are engaged (magenta).
	Top of descent or continue descent symbol: - Top of descent (always white) - Continue descent symbol (white if DES is not armed, blue if it is).
	Start of CLIMB symbol: - White if CLB is not armed - Blue if CLB is armed.
	Intercept point symbol: The point where the aircraft is predicted to intercept the descent path, if there is any vertical deviation when the aircraft is in DES mode (white if DES is not engaged, blue if it is).
•	Speed change symbol: The point at which the aircraft will initiate an automatic ACCEL or DECEL from current speed to a new computed speed if it encounters a SPD LIM, SPD CSTR, or HOLDING SPD (magenta).

PREDICTIONS DISPLAYED ON THE MCDU

Ident.: DSC-22_20-40-30-00011093.0001001 / 14 MAY 12
Applicable to: ALL

The predictions displayed on the MCDU assume that AP (or FD order) is controlling the aircraft and flying it along the preplanned lateral and vertical flight plan.

Therefore:

- If the aircraft is guided along the flight plan (managed guidance), the MCDU predictions correspond exactly to what the aircraft is doing
- If the aircraft is not guided along the flight plan (selected guidance), the MCDU predictions assume that it will return immediately to the flight plan, intercepting at a predetermined angle, and will then proceed under managed guidance
- If the aircraft does not fly the managed speed profile (ECON, SPD CSTR...), the MCDU predictions assume that it will remain at the present selected speed/Mach until it reaches the next SPD CSTR or SPD LIM or enters the next flight phase.

CONSTRAINT SYMBOLS (STAR)

Ident.: DSC-22_20-40-30-00011150.0001001 / 14 MAY 12
Applicable to: ALL

When a time speed or an altitude constraint is part of the vertical flight plan, it appears on the F-PLN A page only at the time of insertion, or when predictions are not yet available.
Once available, the time speed and altitude predictions are displayed for all F-PLN waypoints: when a speed or an altitude constraint is at a waypoint, a star symbol appears adjacent to the speed or altitude prediction. If the star is magenta, the constraint is predicted to be matched. If the star is amber, the constraint is predicted to be missed.

Note: *If an altitude constraint is predicted as missed, the system tells you what will be the error at the specific waypoint.*

VERTICAL DEVIATION

Ident.: DSC-22_20-40-30-00011139.0001001 / 29 SEP 15
Applicable to: ALL

During descent, the system indicates to the flight crew the vertical deviation from the computed descent profile (PFD and MCDU) and predicts where the flight crew can rejoin it.
VDEV on the PFD and PROG page, predictions on the MCDU F-PLN page, symbols on the ND, enable assessment to the vertical position versus the computed flight profile.

OPERATION RULES CONCERNING PREDICTIONS

Ident.: DSC-22_20-40-30-00011140.0001001 / 17 AUG 10
Applicable to: ALL

The flight crew must properly update the flight plan data during the flight, in order to obtain accurate and meaningful predictions.

The flight crew should rely on the ND for short-term predictions. It indicates what the aircraft will do under the currently engaged modes (selected or managed).
The flight crew should rely on the MCDU for long-term predictions, when managed guidance is active or about to be reengaged.

OTHER COMPUTATIONS

Ident.: DSC-22_20-40-30-A-00011141.0002001 / 17 AUG 10
4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

ENGINE-OUT CASE

The FMGS computes an engine-out target speed for each flight phase. It computes an engine-out maximum altitude at long-range cruise speed, and displays it on the PROG page.
The new speed target becomes Green Dot in climb, and EO CRZ SPD in cruise.
The system computes the flight plan predictions down to the primary destination. If the aircraft is above EO MAX ALT, the predictions are computed, assuming that a drift down descent will immediately be performed to reach EO MAX ALT.

Ident.: DSC-22_20-40-30-A-00011141.0004001 / 17 AUG 10
Applicable to: MSN 04827-04860

ENGINE-OUT CASE

The FMGS computes an engine-out target speed for each flight phase. It computes an engine-out maximum altitude at long-range cruise speed, and displays it on the PROG page.
The new speed target becomes Green Dot in climb, and EO CRZ SPD in cruise.
The system computes the flight plan predictions in all phases (except takeoff phase) down to the primary destination.

Ident.: DSC-22_20-40-30-A-00011142.0001001 / 17 AUG 10
5 **Applicable to: MSN 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

RECOMMENDED MAXIMUM ALTITUDE (REC MAX)

The recommended maximum altitude is the lowest of the maximum altitude that:
- The aircraft can reach with a 0.3 g buffet margin
- The aircraft can fly in level flight at MAX CRZ rating
- The aircraft can maintain a V/S of 300 ft/min at MAX CLB thrust
- The aircraft can fly at a speed higher than Green Dot and lower than VMO/MMO
- The aircraft is certified at.

The REC MAX altitude is displayed on the PROG page.
Anti-ice is not taken into account for this computation. Refer to QRH graphs if icing conditions are expected.

A maximum altitude using a 0.2 g buffet margin is also computed. It is not displayed, but the system uses it to limit CRZ ALT entry.

Ident.: DSC-22_20-40-30-A-00011142.0003001 / 17 AUG 10
Applicable to: MSN 01143-01459

RECOMMENDED MAXIMUM ALTITUDE (REC MAX)

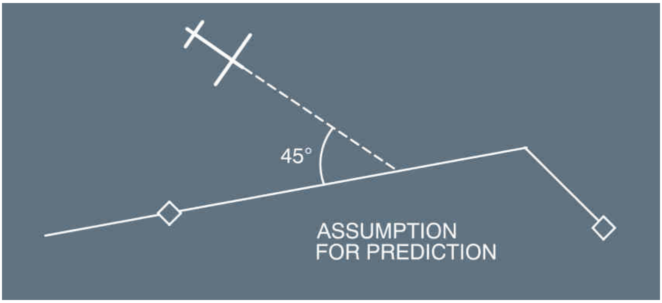
- Simplified wind/temperature models, based on flight crew entries:
  - ALT CRZ wind, as entered on the FUEL PRED page
  - CRZ temperature interpolated from the temperature model for the primary flight plan.
- Airway distance, or direct distance, as provided by the database (manual entry, if not in the database)
- Cost index = 0 (minimum fuel)
- Initial aircraft weight equal to landing weight at primary destination.

Note: *1. No step can be inserted in an alternate flight plan*
2. No predictions are displayed for the selected alternate on flight plan pages. However, the flight crew can read ALTN trip fuel and time on the INIT B page before engine start, and estimated time and estimated fuel on board at alternate on the FUEL PRED page after engine start.

RETURN-TO-TRAJECTORY ASSUMPTIONS

Ident.: DSC-22_20-40-30-00011148.0001001 / 19 DEC 12
Applicable to: ALL

If the aircraft is not on the lateral flight plan, predictions assume an immediate return to the active lateral leg with a 45 ° convergence angle, or that it will fly directly to the “TO” waypoint, when the required convergence angle is greater than 45 °.



ENERGY CIRCLE

Ident.: DSC-22_20-40-30-00011144.0001001 / 17 AUG 10
Applicable to: ALL

The energy circle is a green arc, centered on the aircraft's position and oriented towards the current track line. It is displayed on the NDs during descent, when HDG or TRK mode is selected. It represents the required distance to land from the aircraft's position down to airport elevation at VAPP speed, considering all speed constraints on the vertical profile.

INTRODUCTION TO PERF AND IDLE FACTORS

Ident.: DSC-22_20-40-30-00014856.0001001 / 31 JAN 13
Applicable to: ALL

The FMGS contains a performance database to compute the predictions and the performance data. This performance database has a model of several aircraft configurations (aircraft type/engine model) to tune the performance and the FMGS predictions. For some aircraft configurations, the model can differ from the real aircraft performance. In these cases, the FMGS has to correct the computation of the performance and the predictions. This is the aim of PERF and IDLE factors.
With time, the real aircraft drag and engine performance can deviate from the nominal model.
The airline Flight Operations should periodically revise the value of these factors to adapt FMGS predictions to actual aircraft performance.

Note: The IDLE factor is not available on aircraft with FMS1 Honeywell Legacy.

PERF FACTOR

Applicable to: ALL

Ident.: DSC-22_20-40-30-B-00011145.0001001 / 30 JAN 13

GENERAL

The FMGS uses the PERF factor to correct the predicted fuel flow that is used for the computation of the fuel predictions.

The PERF factor modifies the predicted fuel flow, according to the following formula:

$$\text{FFpred} = \text{FFmodel} \times \left(1 + \frac{\text{PERF FACTOR}}{100}\right)$$

FFpred is the FF used for prediction.
FFmodel is the FF from the aero-engine model.

This correction is applied throughout the entire flight, and modifies the performance predictions and the ECON speed or Mach.
For example: Entering a PERF factor of +1.5 means that Flight Operations have evaluated the aircraft fuel deviation as 1.5 %, compared to the basic performance model (0.0).

IDLE FACTOR

Applicable to: ALL

Ident.: DSC-22_20-40-30-D-00014861.0001001 / 29 SEP 15

GENERAL

The FMGS uses the IDLE factor to adjust the computation of the vertical profile during the descent phase (IDLE segment).

The FMGS computes the vertical profile and the predictions from the Top of Descent (T/D) to the first altitude constraint with the following assumptions:
- The aircraft has a given thrust
- The aircraft has a given speed (within the speed target range).

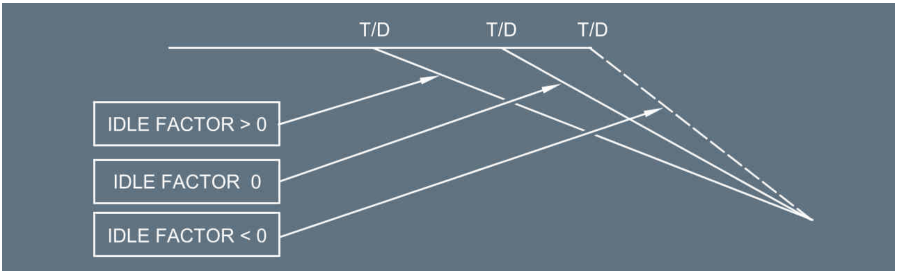
The IDLE Factor adjusts the value of the given thrust by an addition of a delta (DELTA) thrust to IDLE thrust. With this additional thrust, the IDLE Factor gives flexibility to maintain the aircraft on the computed vertical profile in case of external perturbations such as windy conditions (previously entered by the flight crew in WIND pages).
Depending on the IDLE factor value, the FMGS modifies the position of the T/D and computes a vertical profile in function of the given thrust (IDLE + DELTA).

Therefore, the IDLE factor has a direct impact on:
- The computation of vertical profile
- The capability of the aircraft to maintain the vertical profile.

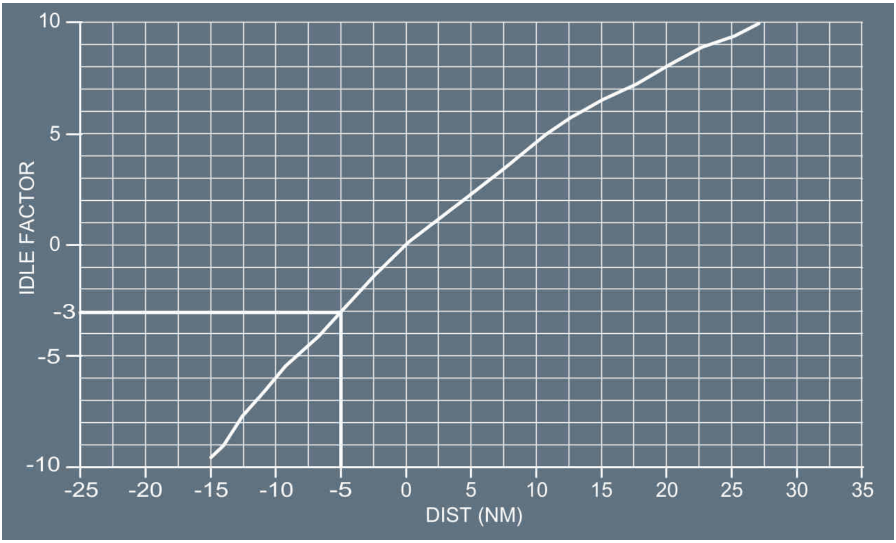
Ident.: DSC-22_20-40-30-D-00014862.0001001 / 23 JUN 15

IMPACT ON VERTICAL PROFILE

- If the IDLE factor is positive, the vertical profile is less steep than with IDLE factor 0. The descent phase starts earlier.
- If the IDLE factor is negative, the descent path is steeper than with IDLE factor 0. The descent phase start later.



The following graph provides an example (average values) of the IDLE factor's effect on descent length:



Example: An IDLE factor of -3 decreases the computed descent length by 5 NM.

Ident.: DSC-22_20-40-30-D-00014863.0001001 / 30 JAN 13

IMPACT ON GUIDANCE

In DES mode, the FMGS maintains the aircraft on the vertical profile and keeps the IAS within the speed target range.
If the aircraft deviates above the profile, the IAS will increase to return to the vertical profile.

PROCEDURE TO MODIFY THE PERF AND IDLE FACTORS

Ident.: DSC-22_20-40-30-00014857.0001001 / 30 JAN 13
Applicable to: ALL

PROCEDURE TO MODIFY THE PERF AND IDLE FACTORS (ON GROUND ONLY)

- PRESS the MCDU DATA key and then the A/C STATUS prompt in order to access the A/C STATUS page
- For aircraft with FMS2 Honeywell or Thales:
  - ENTER the change code in the CHG CODE field.
    The default value for this code is “ARM” but it is possible to modify it on airline request.
    The applicable code is then coded in the Airline Modifiable Information (AMI).
    When a valid change code is entered, the IDLE and PERF factors are displayed in blue.
  - ENTER the new IDLE and PERF factors in the MCDU scratchpad separated by a "/".
    For example: "-2/+1"
  - PRESS the corresponding key to insert the new IDLE and PERF factors.

  The new IDLE and PERF factors are displayed in large blue font.

  Note: *Only authorized personnel should take the responsibility to update the IDLE and PERF factor values.*
- For aircraft with FMS1 Honeywell Legacy:
  - ENTER the new PERF factor in the MCDU scratchpad.
  - PRESS the corresponding key to insert the new PERF factor.

  The new PERF factor is displayed in large blue font.

  Note: *1. Only authorized personnel should take the responsibility to update the PERF factor value.*
  2. The IDLE Factor is not available on aircraft with FMS1 Honeywell Legacy.

TAKEOFF SURVEILLANCE FUNCTION

Ident.: DSC-22_20-45-10-10-00022107.0001001 / 05 JUN 18
Applicable to: ALL

The Takeoff Surveillance (TOS) function checks the takeoff data that the flight crew enters and selects on the FMS pages.
The takeoff surveillance function applies to the FMS pages that are associated with the active flight plan only.

The checks aim to ensure that the takeoff data is:
- Consistent
- Compatible with the aircraft performance data that is required for takeoff.

The FMS performs the following takeoff checks:
- The ZFW check
- The takeoff speeds check.

Ident.: DSC-22_20-45-10-10-00022108.0001001 / 03 NOV 22
Applicable to: ALL

ZFW CHECK

The FMS checks that the ZFW value that the flight crew enters on the FUEL PRED page is within the acceptable range.
If the entered ZFW is not within the acceptable range, the MCDU scratchpad displays the ENTRY OUT OF RANGE message.

Ident.: DSC-22_20-45-10-10-00022109.0003001 / 03 NOV 22

1 **Applicable to: MSN 10949-11597**

TAKEOFF SPEEDS CHECK

For the takeoff speeds (V1, VR, and V2) that the flight crew enters on the PERF TAKEOFF page of the MCDU:

- The FMS checks that the V1, VR, and V2 entry fields contain values.

  If the flight crew does not enter one or more of the takeoff speed values, the ECAM triggers the T.O SPEEDS NOT INSERTED alert, when:
  - The flight crew presses the T.O CONFIG pb, or
  - The engines are set to takeoff power.
- The FMS compares V1, VR, and V2.

  If the entered V1, VR, and V2 do not satisfy the condition V1≤VR≤V2:
  - The MCDU scratchpad displays the V1/VR/V2 DISAGREE message
  - The ECAM triggers the T.O V1/VR/V2 DISAGREE alert, when:
    - The flight crew presses the T.O CONFIG pb, or
    - The engines are set to takeoff power.
- The FMS checks that V1, VR, and V2 satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G). If the entered V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G):
  - The MCDU scratchpad displays the T.O SPEEDS TOO LOW message
  - The ECAM triggers the T.O SPEEDS TOO LOW alert, when:
    - The flight crew presses the T.O CONFIG pb, or
    - The engines are set to takeoff power.

Ident.: DSC-22_20-45-10-10-00022109.0002001 / 03 NOV 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324

TAKEOFF SPEEDS CHECK

For the takeoff speeds (V1, VR, and V2) that the flight crew enters on the PERF TAKEOFF page of the MCDU:

- The FMS compares V1, VR, and V2.

  If the entered V1, VR, and V2 do not satisfy the condition V1≤VR≤V2:
  - The MCDU scratchpad displays the V1/VR/V2 DISAGREE message.
- The FMS checks that V1, VR, and V2 satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G). If the entered V1, VR, and V2 do not satisfy the regulatory requirements for the minimum speeds (VMCG, VMCA, VMU, and VS1G):
  - The MCDU scratchpad displays the TO SPEED TOO LOW message.

ASSOCIATED ALERTS AND MESSAGES

Ident.: DSC-22_20-45-10-30-00022142.0003001 / 05 JUN 18
2 **Applicable to: MSN 10949-11597**

ASSOCIATED ALERTS

If the takeoff surveillance function of the FMS detects an abnormal situation, one or more of the following ECAM alerts are triggered:

- T.O SPEEDS NOT INSERTED
- T.O SPEEDS TOO LOW
- T.O V1/VR/V2 DISAGREE

Ident.: DSC-22_20-45-10-30-00022143.0002001 / 05 JUN 18
Applicable to: ALL

ASSOCIATED MESSAGES

On the MCDU, the FMS message area displays the following messages:

- ENTRY OUT OF RANGE
- TO SPEED TOO LOW
- V1/VR/V2 DISAGREE .

Intentionally left blank

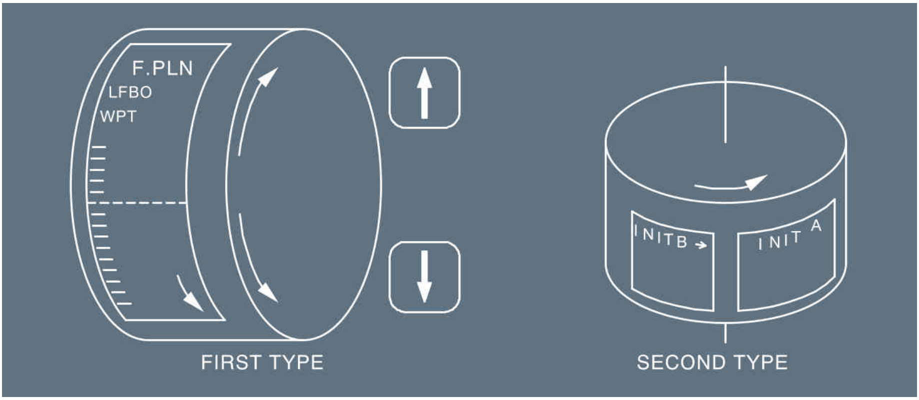
FMS2 Honeywell

GENERAL

Ident.: DSC-22_20-50-10-25-00000556.0001001 / 01 OCT 12

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The Flight Management and Guidance System (FMGS) displays information on various “pages”. When a page cannot display all of the assigned information, it cues the pilot to call up additional information. There are three types of pages, and each type has its particular way of cuing the pilot to call up additional information.



FIRST TYPE

When this page cannot simultaneously display all the information on the screen (more information than the six pairs of lines can hold), the pilot can scroll the page up or down.
In this case, the screen displays a ↑ ↓ symbol in the bottom righthand corner (F-PLN pages, secondary F-PLN page, departure/arrival pages,...).

SECOND TYPE

When the information is on successive pages, the pilot presses the “NEXT PAGE” key to sequentially call up these pages.
In this case, an arrow is displayed in the top righthand corner of the screen (INIT pages).

THIRD TYPE

When different types of information are on successive pages, the pilot calls up these pages by pressing the key adjacent to the prompts >, < or *.

3R
4R
5R
6R

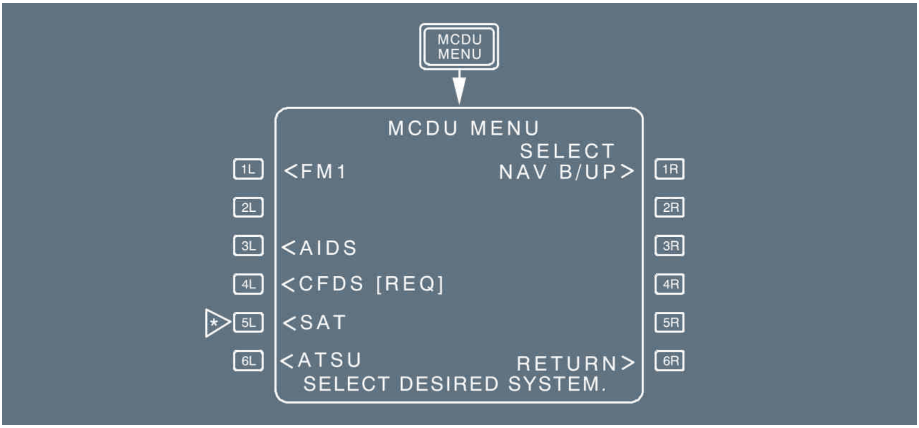
The pilot selects a system by pressing the key adjacent to the name of that system. The name of the selected system is displayed in green, all others in white.
If the MCDU cannot establish communication with the selected system, it displays “OUT”.
When a system calls for the pilot's attention, the MCDU displays “REQ” next to the system's name, and the “MCDU MENU” annunciator lights up.
When the pilot presses the key next to the name of the system requiring attention, the “MCDU MENU” annunciator light goes out.

MCDU MENU PAGE

Ident.: DSC-22_20-50-10-25-00000557.0010001 / 14 MAY 12

2 **Applicable to: MSN 03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page lists the various systems which the pilot can access via the MCDU.



The flight crew selects a system by pressing the key adjacent to the name of that system.
The name of the selected system is displayed in green, all others in white.
If the MCDU cannot establish communication with the selected system, it displays “OUT”.
When a system calls for the flight crew attention, the MCDU displays “REQ” next to the system’s name, and the “MCDU MENU” annunciator lights up.
When the flight crew presses the key next to the name of the system requiring attention, the “MCDU MENU” annunciator light goes out.

SELECT NAV B/UP	Pressing the [1R] key selects the NAV B/UP function and DESELECT NAV B/UP appears in the [1R] field. If the NAV B/UP is inoperative, the field is blank.
RETURN	This field is displayed when a function is active

When the MCDU communicated with a system other than the FMGC, the flight crew should use the MCDU MENU page to revert to the FMGC system.

INIT A PAGE

3 **Applicable to: MSN 10949-11597**

The flight crew uses the INIT A page to initialize the flight plan and align the inertial reference system.

- The flight crew presses the INIT key on the MCDU to access the INIT A page. The INIT A page can be accessed on ground or in flight.
- The flight crew may also display this page by:
  - Pressing the “NEXT PAGE” key or the [←] or [→] keys (depending on the MCDU type) on the MCDU console, while on the INIT FUEL PRED page, or
  - Pressing the key next to “RETURN” or “INSERT” on the route selection page, or
  - Pressing the key next to “INSERT” on the WIND page.
- When in the DONE phase, the flight crew presses the INIT key to switch to the next preflight phase.

[1L] CO RTE	If the flight crew enters a company route number, the screen displays all data associated with that route (8 or 10 characters, depending on the pin program). Inserting the CO RTE into the route selection page also enters the CO RTE number in this field.

[2L] ALTN/CO RTE	This field is dashed, until a primary destination is entered in the [1R] field. If a preferred alternate is associated with the primary destination, it is displayed in this field with the company route identification. The flight crew may manually enter an alternate and company route. If preferred alternate is not associated with the primary destination, NONE is displayed in this field. When the alternate route and the primary destination do not match, the MCDU scratchpad displays DEST/ALTN MISMATCH. If the primary destination is changed, this field is modified accordingly.
[3L] FLT NBR	The flight number automatically appears in this field, if it is stored with the company route. The flight crew may modify it, or enter a new number here.
[5L] COST INDEX	This is usually stored in the database along with the company route. The flight crew may modify it, or enter a new value here. The system defaults to the last entered value, if a value is not stored in the database.
[6L] CRZ FL/TEMP	The cruise flight level is usually stored in the database along with the company route. If not, it has to be entered manually. If no cruise flight level is entered, the system will not furnish predictions, while the aircraft is on the ground. The flight crew has to enter the temperature at cruise flight level in order to refine the predictions. Otherwise, these are computed for ISA conditions. If no sign is entered, the system uses a minus.
[1R] FROM/TO	This field allows the flight crew to enter a city pair (ICAO codes for city of origin and destination). This entry automatically deletes any previously entered company route and calls up the route selection page. If one airfield of the pair is not in the database, the display changes to the NEW RWY page.
[2R] INIT REQUEST	This prompt is displayed if the flight crew did not enter an active flight plan or entered a flight number or a company route that is not in the aircraft database. Selecting this prompt sends the ground a request for active flight plan initialization (downlink message). When the asterisk is not displayed, a downlink message cannot be sent. The uplink flight plan is automatically inserted in the active flight plan, prior to engine start, provided an active flight plan does not exist. After engine start, the uplink flight plan is sent to the secondary flight plan and manually inserted or rejected.
[3R] IRS INIT	The flight crew presses this key to access the IRS INIT page.

[4R] WIND	The flight crew presses this key in order to obtain access to the CLB WIND page, unless a temporary flight plan exists. In this case, the scratchpad displays TEMPORARY F-PLN EXISTS.
[5R] TROPO	The default tropopause altitude is 36 090 ft. The flight crew can use this field to modify it (60 000 ft maximum).
[6R] GND TEMP	The flight crew can use this field to insert the ground temperature (in Celsius) during the cockpit preparation. The FMS uses this value to compute the ISA deviation profile for the Climb segment. When no pilot entry exists, or if the pilot entry is cleared, the GND TEMP value reverts to the default ISA value at the selected Departure Airport altitude.

INIT A PAGE

Ident.: DSC-22_20-50-10-25-00000558.0009001 / 01 MAR 18

[1L] CO RTE	If the flight crew enters a company route number, the screen displays all data associated with that route (8 or 10 characters, depending on the pin program). Inserting the CO RTE into the RTE selection page also enters the CO RTE number in this field.
[2L] ALTN/CO RTE (blue)	This field is dashed, until a primary destination is entered in the 1R field. If a preferred alternate is associated with the primary destination, it is displayed in this field with the company route identification. The crew may manually enter an alternate and company route. If preferred alternate is not associated with the primary destination, NONE is displayed in this field. When the alternate route and the primary destination do not match, the MCDU scratchpad displays “DEST/ALTN MISMATCH”. If the primary destination is changed, this field is modified accordingly.

[3L] FLIGHT NUMBER	The flight number automatically appears in this field, if it is stored with the company route. The flight crew may modify it, or enter a new number here.
[5L] COST INDEX	This is usually stored in the database along with the company route. The flight crew may modify it, or enter a new value here. It defaults to the last entered value, if a value is not stored in the database.
[6L] CRZ FL/TEMP (cruise flight level and temperature)	The cruise flight level is usually stored in the database along with the company route. If not, it has to be entered manually. If no cruise flight level is entered, the system will not furnish predictions, while the aircraft is on the ground. The flight crew has to enter the temperature at cruise flight level in order to refine the predictions. Otherwise, these are computed for ISA conditions. (If no sign is entered, the system uses a plus).
[1R] FROM/TO	This field allows the pilot to enter a city pair (ICAO codes for city of origin and destination). This entry automatically deletes any previously entered company route and calls up the route selection page. If one airfield of the pair is not in the database, the display changes to the NEW RWY page.
[2R] INIT REQUEST	This prompt is displayed if the pilot did not enter an active flight plan or entered a flight number or a company route that is not in the aircraft database. Selecting this prompt sends the ground a request for active flight plan initialization (downlink message). When the star is not displayed, a downlink message cannot be sent. The uplink flight plan is automatically inserted in the active flight plan, prior to engine start, provided an active flight plan does not exist. After engine start, the uplink flight plan is sent to the secondary flight plan and manually inserted or rejected.
[3R] IRS INIT	The flight crew presses this key to access the IRS INIT page.
[5R] WIND	The pilot presses this key in order to gain access to the climb wind page, unless a temporary flight plan exists. In this case, the scratchpad displays TEMPORARY F-PLN EXISTS.
[6R] TROPO	The default tropopause altitude is 36 090 ft. The pilot can use this field to modify it (60 000 ft maximum).

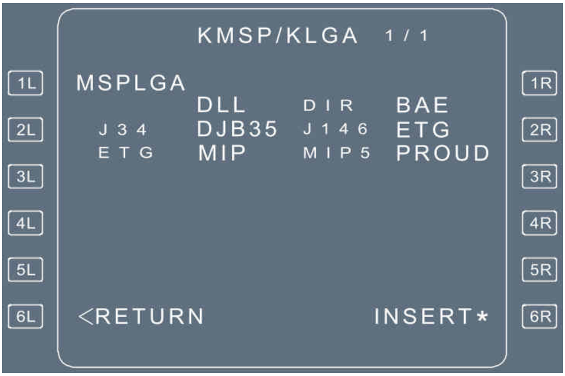
ROUTE SELECTION PAGE

Ident.: DSC-22_20-50-10-25-00000559.0001001 / 17 MAR 11

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page displays all the company routes, stored in the database, that are associated with the inserted city pair. They can be called up manually, or displayed automatically.

- Manually : The pilot presses the FROM/TO or ALTN key on the INIT A page when a city pair is displayed.
- Automatically : The system displays it, when the pilot enters a city pair, or defines an alternate on the INIT A page of the active or secondary flight plan.



```

<RETURN                   INSERT*
```

TITLE	Idents for the city pair inserted on the INIT A page. (The numbers in the upper righthand corner are the total number of company routes from this city pair stored in the database).
[1L]	This field shows the name of the company route. NONE appears, if there is no company route for this city pair.
Line 2 to Line 5	These fields display the various elements of the company route: Waypoints in large green font, and airways in small white font.
[6L] RETURN	The pilot presses this key to return to the INIT A page.
[6R] INSERT	The pilot presses this key to insert the displayed company route in the flight plan, and return to the INIT A page.

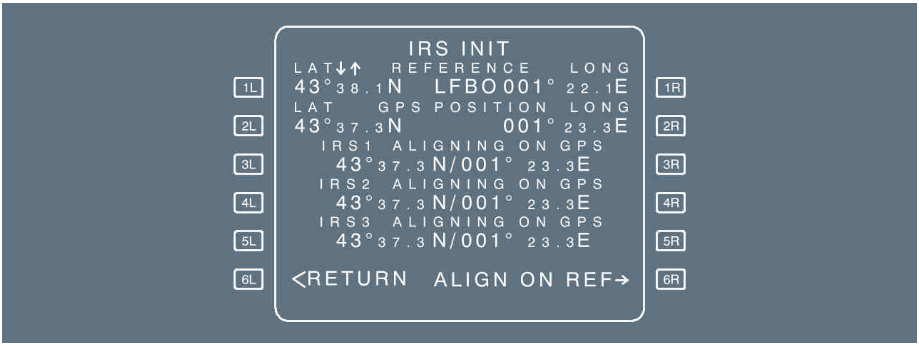
Note: *The pilot can slew the display to show the rest of the route, if one page does not show it all, or to display other company routes for this city pair.*

IRS INIT PAGE

Ident.: DSC-22_20-50-10-25-00013511.0051001 / 14 MAY 12

5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The flight crew uses the IRS INIT page to align the inertial reference system. The crew accesses this page, by pressing the IRS INIT key on the INIT A page.



IRS INIT
LAT↓↑ REFERENCE LONG
43°38.1N LFBO 001°22.1E
LAT GPS POSITION LONG
43°37.3N 001°23.3E
IRS1 ALIGNING ON GPS
43°37.3N/001°23.3E
IRS2 ALIGNING ON GPS
43°37.3N/001°23.3E
IRS3 ALIGNING ON GPS
43°37.3N/001°23.3E
<RETURN ALIGN ON REF→

Line 1 LAT-REFERENCE-LONG	This line provides the latitude and longitude of the FM reference position. This reference is extracted from the navigation database. The flight crew can modify this reference. Only when the FM reference position matches the origin airport position, the airport identifier is displayed in green. Otherwise, there are dashes at the place of the airport identifier. Latitude and longitude of the FM reference position are displayed in blue. The flight crew can modify the latitude and longitude values using the scroll keys.
Line 2 LAT-GPS POSITION-LONG	This line displays the GPS position latitude and longitude.
Line 3 to 5	These lines display the IRS 1-2-3 alignment state, source and latitude/longitude. The alignment status can be ALIGNING ON XXX, or ALIGNED ON XXX or IN ATT. XXX is the alignment source and can be GPS or CDU or REF. It is displayed in white font. The latitude and longitude values are displayed in green.
[6L] RETURN	This prompt enables the flight crew to return to the INIT A page.

[6R]	If a reference is available, field displays ALIGN ON REF → in blue which is replaced by CONFIRM ALIGN* in amber when 6R prompt is pressed. Pressing again the 6R prompt enables the transmission of the FM reference position displayed in line 1.

WIND PAGES

Ident.: DSC-22_20-50-10-25-00000560.0010001 / 26 NOV 19

6 **Applicable to: MSN 10949-11597**

Winds in climb, cruise, descent and approach are necessary to provide the flight crew with reliable predictions and performance. Wind pages enable the flight crew to enter and/or review the winds propagated by the FMGS or sent by ACARS for the various flight phases.

Note: *On WIND pages, wind direction is always true-referenced.*

CLIMB WIND PAGE

This page enables the flight crew to enter and/or review predicted wind vectors (direction and velocity) at up to 5 different levels.

THE CLIMB WIND PAGE IS ACCESSED FROM:

TITLE	CLIMB WIND in large white font.

[1L] to [5L] TRU WIND/ALT	This field displays the winds, entered at various climb altitudes : In blue before climb phase activation, and in green after climb phase activation. This field may also display history winds or uplink winds. Large blue brackets are displayed before any wind entry. Flight crew-entered and uplinked winds are displayed in large font. History wind data is displayed in small font. Upon sequencing the top of climb, the climb winds are deleted. *Note:* *Climb winds are not deleted, when the origin airport is changed.*
[1R] HISTORY WIND	Displayed in preflight phase only. This key calls up the history wind page. This page is not modifiable (small green font), but can be inserted into the CLIMB WIND page by using the 6R key and modified accordingly.
[2R] WIND/TEMP REQUEST	Pressing this key sends a request for ACARS winds and temperature. (*Refer to DSC-22_20-70 Wind Data - Request for Wind Data*)
[5R] NEXT PHASE	Pressing this key calls up the CRUISE WIND page, or the DESCENT WIND page, if no cruise waypoint exists.

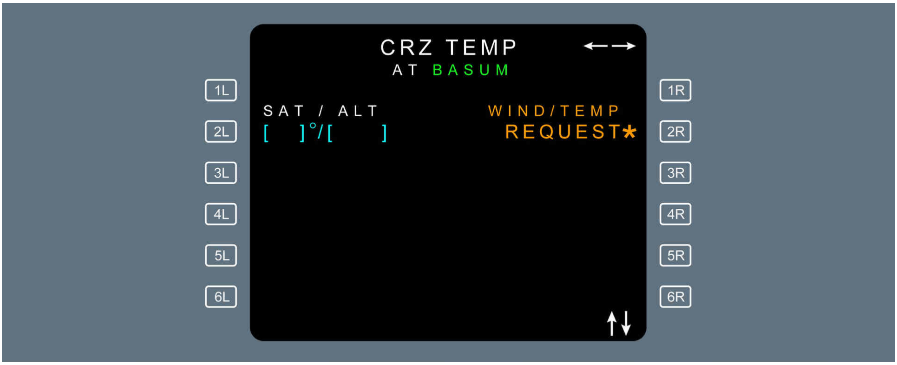
TITLE	CRZ WIND.
AT [location]	[location] is the fix at which the temperature data is defined
[2L] to [5L] TRU WIND/ALT	These fields display the entered wind at various altitudes in blue. The entered winds are propagated at the same altitude to the downpath cruise waypoints, if no other winds are entered. The propagated wind direction and velocity appears in small fonts. Both uplinked winds and flight crew-entered winds are displayed in large blue font. During cruise, the modification of wind data is possible.
[2R] WIND/TEMP REQUEST	Pressing this key sends a request for ACARS winds and temperature. (*Refer to DSC-22_20-70 Wind Data - Request for Wind Data*)
[4R] PREV PHASE	This prompt is displayed in Preflight, Takeoff, Climb and Done phases. Pressing this prompt calls up the CLIMB WIND page.
[5R] NEXT PHASE	Pressing this prompt calls up the DES WIND page.
← →	Allow the flight crew to use the NEXT PAGE MCDU key to go to the CRZ TEMP Page

↑ ↓	Allow the flight crew to go to the next waypoint CRZ WIND Page.

Any new entry performed on the CRZ WIND page is immediately inserted into the corresponding flight plan. Predictions are dashed on the F-PLN pages during the recomputation time. CRZ WIND page automatically reverts to F-PLN page, if a temporary flight plan is created or the secondary flight plan is activated.



[2L] SAT/ALT	This field allows the flight crew to enter a temperature at a given flight level, or to display a propagated value. The flight crew must enter both temperature and altitude at the first entry. They can then independently modify the temperature, or the altitude.
[2R] WIND/TEMP REQUEST	Pressing this key sends a request for ACARS winds and temperature. (*Refer to DSC-22_20-70 Wind Data - Request for Wind Data*)

DESCENT WIND PAGE

This page enables the flight crew to define and display the winds used to compute the descent profile.

To display the DES WIND page, the flight crew selects the NEXT PHASE prompt on the CRUISE WIND page or the WIND prompt on the VERT REV page. The DESCENT WIND page enables the definition of a wind and a temperature at 5 different altitude levels.

4L PHASE> 4R
5L 5R
6L 6R
Arrow ↑ or ↓ only displayed if 6 or more WIND/ALT entires are inserted

[1L] to [6L]	Up to 11 manual or uplinked temperatures can be inserted: - The first 6 are displayed on page 1 from [1L] to [6L] - The next 5 are displayed on page 2 from [1L] to [5L]. To access pages 1 and 2 press the ↑ or ↓ key on MCDU, when ↑ or ↓ appear at the bottom right of the MCDU screen. An entry of “GRND” in the “ALT” field is indicated as the wind at ground level. This wind is copied on the PERF APPR page (and corrected for the magnetic variation). A clear action on one key reverts the line to blue brackets.
[xL] ALTERNATE	This field only appears when an alternate is defined. This field appears on page 1 (from [2L] to [6L]) or page 2 (from [1L] to [6L]) based on the number of manually inserted or uplinked WIND/ALT values. This field always follow the last WIND/ALT values inserted, and automatically bumps down/up after each new WIND/ALT insertion/deletion. The flight crew-entered value or uplinked value is displayed in large blue font. The flight crew can always modify it.
[2R] WIND/TEMP REQUEST	Pressing this key sends a request for ACARS winds and temperature. (*Refer to DSC-22_20-70 Wind Data - Request for Wind Data*)

[4R] PREV PHASE	Pressing this key calls up the CRUISE WIND page. The field is erased after the top of descent has sequenced.
Blank or ↑ or ↓	If 6 or more WIND/ALT values are inserted, these keys enable the flight crew to go to the next/previous DESCENT WIND page.

Note: *If the destination airport is changed, descent winds and alternate wind are deleted.*

WIND PAGES

[1L] to [5L]	This displays inserted winds or uplinked winds, in large blue fonts, prior to activating the descent phase (modifiable values), and in green after descent phase activation (not modifiable values). An entry of “GRND” in the “ALT” field is seen as the wind at ground level. This wind is copied on the PERF APPR page (and corrected for the magnetic variation). A clear action on one key reverts the line to blue brackets.
[6L] ALTERNATE	This field is only displayed when an alternate is defined. The pilot-entered value or uplinked value is displayed in large blue font. It is always modifiable by the pilot.
[2R] WIND REQUEST*	Pressing this key sends a request for ACARS winds.
[4R] PREV PHASE	Pressing this key calls up the CRUISE WIND page. The field is erased after the top of descent has sequenced.

Note: *Descent winds and alternate wind are deleted, if the destination airport is changed.*

INIT FUEL PRED PAGE

Ident.: DSC-22_20-50-10-25-00000561.0010001 / 05 MAY 22

7 **Applicable to: MSN 10949-11597**

Note: *With FMS2 Release 2 the name of the INIT B page is changed to INIT FUEL PRED page. However, the Flight Operations documents include references of both names.*

The pilot uses this page to initialize the gross weight and center of gravity, before starting the engines.
As long as the engines are not yet started, the flight crew displays this page via one of the following:

- From the INIT A page when they press the NEXT PAGE key on the MCDU, or
- When they press the FUEL PRED key on the MCDU.

This page automatically reverts to the FUEL PRED page after the first engine is started.
The FMGC will stop using the pilot-entered block fuel and will compute its predictions based on the FOB indicated by the FQI computer (or the FAC as a back up) from that moment on.

BLOCK CONFIRM*
1L 2L 3L 4L 5L 6L
1R 2R 3R 4R 5R 6R

[1L] TAXI	This is the taxi fuel, which defaults to a preset value, (usually 200 kg or 400 lb in the AMI file). The crew can change the value through this field.
[2L] TRIP/TIME	This field displays trip fuel and time when predictions become available. The pilot cannot modify this data.

[3L] RTE RSV/%	This field displays the contingency fuel for the route and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can either enter a fuel quantity, or a percentage.
[4L] ALTN/TIME	Displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.
[5L] FINAL/TIME	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). Before any crew entry, the FINAL field is dashed and FINAL TIME field is defaulted to the value specified in the AMI file (typically 30 min). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB	Displays the expected minimum fuel at destination. It is equal by default to the ALTN + FINAL fuel. This field can be modified directly by the flight crew, and is also impacted by the modification of ALTN and/or FINAL fuel. *Note:* *If pilot entry of MIN DEST FOB is lower than ALTN + FINAL fuel, the message CHECK MIN DEST FOB is triggered on the MCDU.*
[1R] ZFW/ZFWCG	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight CG (ZFWCG). The flight crew must enter the ZFW/ZFWCG values (as appropriate) to obtain a speed profile and predictions. *Note:* *If the flight crew enters a ZFW value that exceeds the acceptable range (as defined in the OPC or in the performance database), the ENTRY OUT OF RANGE message appears and the value is rejected.*
[2R] BLOCK	The block fuel in this field is a mandatory entry that enables the system to predict the estimated fuel on board (EFOB). The FMGC may also compute the block, if the flight crew selects the FUEL PLANNING function.

[3R] FUEL PLANNING	Initiates an FMGC block fuel computation using current hypothesis and extra = 0. When the pilot selects this function, FUEL PLANNING becomes green, and the BLOCK field is dashed during FMGC computation. The title of the page changes to INIT FUEL PLANNING, and BLOCK CONFIRM* replaces the FUEL PLANNING prompt, when the block fuel is computed by the FMGC. If the pilot modifies the parameters used to compute prediction before confirmation, the computation automatically restarts and FUEL PLANNING is displayed in green.
[4R] TOW/LW	Displays the computed Takeoff Weight (TOW) and Landing Weight (LW) at the primary destination. This cannot be modified.
[5R] TRIP WIND	This field allows the entry of a mean wind component for the trip from the origin to the destination. Upon entry of a CO RTE or FROM/TO pair, this field defaults to HD 000 in small font. An entry preceeded by –, H, HD is considered to be headwind, +, T, TL to be tailwind. The entered speed is displayed in large blue font. When the flight crew inserts a wind on the CLIMB, CRUISE or DESCENT WIND page, or on the PERF APP page, the system no longer considers the trip wind, and the corresponding field is dashed.
[6R] EXTRA/TIME	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + MIN DEST FOB). The field displays its information in small font, and it cannot be modified by the flight crew.

INIT B PAGE

Ident.: DSC-22_20-50-10-25-00000561.0009001 / 01 MAR 18

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The pilot uses this page to initialize the gross weight and center of gravity, before starting the engines.
The pilot can call it up from the INIT A page during preflight phase prior to engine start, by pressing the NEXT PAGE key on the MCDU console, as long as engines have not been started.
This page automatically reverts to the FUEL PRED page after the first engine is started.
The FMGC will stop using the pilot-entered block fuel and will compute its predictions based on the FOB indicated by the FQI computer (or the FAC as a back up) from that moment on.

[1L] TAXI	This is the taxi fuel, which defaults to a preset value, (usually 200 kg or 400 lb in the AMI file). The crew can change the value through this field.
[2L] TRIP/TIME (green)	This field displays trip fuel and time when predictions become available. The pilot cannot modify this data.
[3L] RTE RSV/% (blue)	This field displays the contingency fuel for the route and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can either enter a fuel quantity, or a percentage.
[4L] ALTN/TIME (blue/green)	Displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.

[5L] FINAL/TIME (blue)	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the "airline fuel policy" section of the AMI). Before any crew entry, the FINAL field is dashed and FINAL TIME field is defaulted to the value specified in the AMI file (typically 30 min). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the "airline fuel policy" section of the AMI).
[6L] MIN DEST FOB (blue)	Displays the expected minimum fuel at destination. It is equal by default to the ALTN + FINAL fuel. This field can be modified directly by the flight crew, and is also impacted by the modification of ALTN and/or FINAL fuel. Note: *If pilot entry of MIN DEST FOB is lower than ALTN + FINAL fuel, the message "CHECK MIN DEST FOB" is triggered on the MCDU.*
[1R] ZFW/ZFWCG (blue)	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight CG (ZFWCG). The flight crew must enter the ZFW/ZFWCG values (as appropriate) to obtain a speed profile and predictions. Note: *If the flight crew enters a ZFW value that exceeds the acceptable range (as defined in the OPC or in the performance database), the "ENTRY OUT OF RANGE" message appears and the value is rejected.*
[2R] BLOCK	The block fuel in this field is a mandatory entry. When the flight crew enters a block fuel, the page title changes to INIT FUEL PREDICTION.
[3R] FUEL PLANNING (amber)	Initiates an FMGC block fuel computation using current hypothesis and extra = 0. When the pilot selects this function, FUEL PLANNING becomes green, and the BLOCK field is dashed during FMGC computation. The title of the page changes to INIT FUEL PLANNING, and BLOCK CONFIRM* replaces the FUEL PLANNING prompt, when the block fuel is computed by the FMGC. If the pilot modifies the parameters used to compute prediction before confirmation, the computation automatically restarts and FUEL PLANNING is displayed in green.
[4R] TOW/LW (green)	Displays the computed Takeoff Weight (TOW) and Landing Weight (LW) at the primary destination. This cannot be modified.

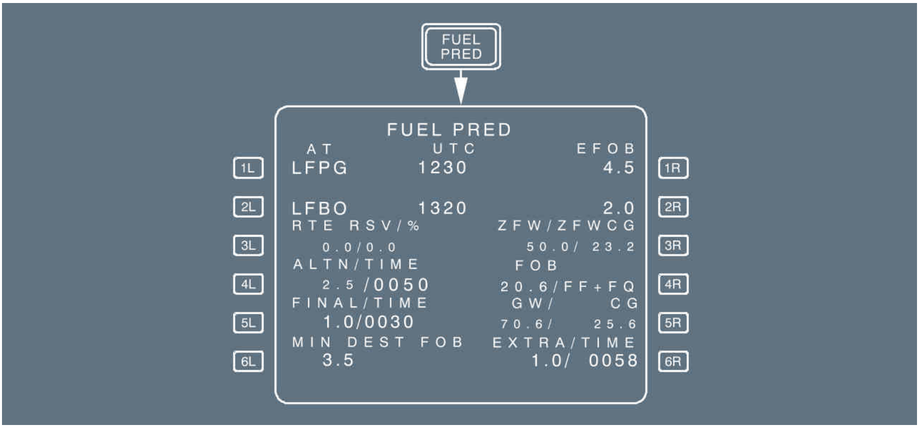
[5R] TRIP WIND (blue)	This field allows the entry of a mean wind component for the trip from the origin to the destination. Upon entry of a CO RTE or FROM/TO pair, this field defaults to HD 000 in small font. An entry preceeded by –, H, HD is considered to be headwind, +, T, TL to be tailwind. The entered speed is displayed in large blue font. When the flight crew inserts a wind on the CLIMB, CRUISE or DESCENT WIND page, or on the PERF APP page, the system no longer considers the trip wind, and the corresponding field is dashed.
[6R] EXTRA/TIME (green)	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + MIN DEST FOB). The field displays its information in small font, and it cannot be modified by the flight crew.

FUEL PREDICTION PAGE

Ident.: DSC-22_20-50-10-25-00000562.0009001 / 01 MAR 18

8 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The pilot presses the FUEL PRED key on the MCDU console to display fuel prediction information at destination and alternate, as well as fuel management data after the engines are started.



```
            FUEL PRED

   0.0/0.0              50.0/ 23.2
ALTN/TIME                FOB
   2.5 /0050          20.6/FF+FQ
FINAL/TIME              GW/     CG
   1.0/0030            70.6/   25.6
MIN DEST FOB          EXTRA/TIME
   3.5                   1.0/ 0058
```

[1L] - [1R] AT-UTC/TIME-EFOB (green)	Display time and fuel predictions to the primary destination. TIME is displayed before takeoff. UTC predictions are displayed after takeoff. If the flight crew has entered an Estimated Takeoff Time (ETT), the UTC is displayed. The EFOB at destination will turn to amber, if it becomes less than the MIN DEST FOB value.
[2L] - [2R] AT-UTC/TIME-EFOB (green)	These lines display time and fuel predictions to the alternate airport.
[3L] RTE RSV% (blue)	Before departure, this field displays the route reserve fuel and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The crew can either enter a fuel quantity or a percentage. After takeoff, it becomes green 0.0/0.0, and the corresponding fuel is added to the EXTRA fuel.
[4L] ALTN/TIME (blue/green)	Displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.
[5L] FINAL/TIME (blue)	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB (blue)	Displays the expected Minimum Fuel at Destination. It is equal to the FINAL + ALTN fuel. The field can be modified directly by the flight crew, and is also impacted by the modification of the ALTN and/or the FINAL fuel.
[3R] ZFW/ZFWCG (blue)	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight Center of Gravity (ZFWCG) values, as entered before engine start on the INIT B page. The flight crew can re-enter or modify these values after engine start on the FUEL PRED page. If at engine start, no ZFW or ZFWCG values have been entered, amber boxes are displayed in the corresponding field. The flight crew must enter the ZFW/ZFWCG values to obtain a speed profile and predictions.

[4R] FOB (blue)	Displays the Fuel On Board (FOB) calculated by the FMGS and the following fuel sensors: - Fuel flow and fuel quantity sensors (/FF+FQ) - Fuel flow sensors only (/FF). - Fuel quantity sensors only (/FQ). The flight crew can modify the FOB value in flight, or modify the sensors used by entering “/FF”, “/FQ” or “/FF+FQ”, as required.
[5R] GW/CG (green)	The FMS continuously updates the GrossWeight (GW) and Center of Gravity (CG) during the flight. The field displays dashes, as long as the system is not calculating the Fuel On Board, or the ZFW has not been entered by the flight crew. The field cannot be modified.
[6R] EXTRA/TIME (green)	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = FOB – (TAXI + TRIP + RSV + MIN DEST FOB). This field displays its information in small green font, and it cannot be modified by the flight crew.

Note: All fields are dashed before engines are started.

FLIGHT PLAN PAGES

Ident.: DSC-22_20-50-10-25-00000563.0009001 / 26 NOV 19

9 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

These pages display all waypoints of the active and alternate flight plans, along with associated predictions.

The flight crew can make all revisions to the lateral and vertical flight plans from these pages:

The flight crew presses the left key to revise the lateral flight plan, and the right key to revise the vertical flight plan.

The flight crew presses the F-PLN key on the MCDU console to access the Flight Plan A page of the active flight plan.

FLIGHT PLAN A PAGE

Flight Plan A Page displays time, speed, and altitude predictions for each active flight plan waypoint.

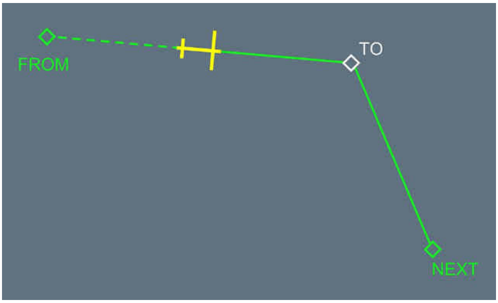
TITLE	FLIGHT NUMBER (blank, if no flight number has been entered). This line may display: TMPY in yellow if a temporary flight plan exists; OFST in white, if a lateral offset is flown; or, OFST in yellow, if a lateral offset revision is pending.
Line 1 to Line 5 WPT, UTC, SPD, ALT	These lines display consecutive waypoints along with associated predictions of time, speed or Mach and altitude for each. TIME is displayed before takeoff, and UTC after takeoff. After the flight crew enters an Estimated Takeoff Time (ETT), UTC is displayed. The time and flight level display at the FROM waypoint (first line of the flight plan) are values that the system memorized at waypoint sequencing.

[1R] SPD/ALT	The field dedicated to SPEED or MACH is blank at the FROM waypoint, except at the departure airport (V1 associated with runway elevation, is displayed). *Note: When the HOLD marker is slewed, the HOLD SPD Label will overwrite the TIME/UTC title.*
Line 6, DEST UTC/TIME DIST, EFOB	DIST is the distance to destination along the displayed flight plan. EFOB is the estimated fuel on board at destination. The EFOB at destination will turn to amber, if it becomes less than the MIN DEST FOB value. The sixth line is permanent and is displayed in white font once predictions are available, except when a TMPY F-PLN is displayed or in some cases when an ALT CSTR is entered ("*CLB or DES*" prompt appears).

Note: The predicted altitude at a waypoint is related to the QNH below the transition altitude, and is given as a flight level above the transition altitude.



The generic flight plan page displays the FROM waypoint (last waypoint to be overflown) on the first line, and the TO waypoint (in white) on the second line. The FROM/TO flight plan leg is called the active leg.
The flight crew can use the scroll keys to review all flight plan legs down to the last point of the alternate flight plan. The AIRPORT key serves as a fast slew key. The flight crew can press it to call up the next airport (DEST, ALTN, ORIGIN) to be displayed on the flight plan page.
In order to return to the beginning of the flight plan page, the flight crew presses the F-PLN key on the MCDU console.
The display shows the name of the leg between two waypoints, and the distance between them on a line between the lines that identify them. During an approach, this in-between line also defines the angle of the final descent path. For example, "2-3 °" indicates that the leg is two nautical miles long, and the flight path angle is -3 °.

The display shows the bearing between FROM and TO waypoints as the bearing from the aircraft position to the TO waypoint. It shows track (TRK) between the waypoints shown in lines 2 and 3. This is the outbound track of the next leg.
If the database contains a published missed approach procedure, or if someone has inserted one manually, the display shows it in blue after the destination runway identification. It turns green when the go-around phase becomes active.
After the last waypoint of the missed approach, the display shows the alternate flight plan in NAV mode.
When NAV mode is engaged, the flight crew can only clear or modify the TO waypoint by using the DIR key on the MCDU console.

PREDICTIONS

The system calculates and displays predictions for all waypoints.
It uses the current wind to compute TO waypoint predictions, and uses predicted winds to compute all others.

CONSTRAINTS

The database may define an altitude or speed constraint for each waypoint of the climb, descent, and approach phases, or the flight crew may manually insert such constraints (except at origin, destination, FROM, and pseudo-waypoints) or a time constraint (RTA).
The constraints are displayed in magenta, as long as predictions are not completed.
Once predictions are available, constraints are replaced by speed, time and altitude predictions, preceded by stars. If the star is in magenta, the system predicts that the aircraft will match the constraint (altitude within 250 ft, speed not more than 10 kt above the constraints, RTA within the required accuracy). If the star is in amber, the system predicts that the aircraft will miss the constraint and the MCDU displays: SPD ERROR AT WPTXX for speed constraint, or RTA MISSED AT XXX for time constraint.

Note: *SPD and ALT CSTR may either be entered on the VERT REV page or directly on the F-PLN A page, whereas TIME CSTR may only be entered from the RTA page.*

PSEUDO-WAYPOINTS

Pseudo-waypoints are geographical positions corresponding to an event in the vertical flight plan: T/C (top of climb), T/D (top of descent), SPD/LIM (speed limit), DECEL (deceleration for approach), etc. The display shows them as waypoints in parentheses.

APPROACH DISPLAY

The flight crew cannot enter an altitude constraint at destination or Missed Approach Point (MAP).

TITLE	FLIGHT NUMBER (blank if no flight number has been entered).

Line 1 to Line 5 WPT-EFOB-WIND	These lines display consecutive waypoints and associated fuel predictions, and the forecast wind profile. The direction of forecast winds is relative to true north. Forecast winds include winds entered by the flight crew (large font) and the propagated winds at intermediate waypoints (small font). If the flight crew uses a trip wind, it will be displayed for each waypoint. If no other wind entry is made after takeoff, the FROM waypoint will display the actually recorded wind, and the waypoints downpath will still display the trip wind.
Line 6 DEST-UTC/DIST-EFOB	Identical to F-PLN A page.

LATERAL REVISION PAGES

Ident.: DSC-22_20-50-10-25-00000564.0009001 / 26 OCT 22

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11139

These pages give the flight crew a list of the lateral flight plan revisions, which can be used to change the flight plan beyond a selected waypoint.
The flight crew calls up these pages from the flight plan pages (A or B) by pressing the left key adjacent to the selected waypoint.
Different lateral flight plan revisions are available for different waypoints.

TITLE	The ident of the waypoint or airport selected for revision, along with its latitude and longitude. If the selected waypoint is the FROM waypoint, the title omits the aircraft latitude and longitude, and displays the “PPOS” (present position) instead.
[1L] DEPARTURE	This prompt gives the flight crew access to the departure pages, where the flight crew can select and insert runways, SIDs, and TRANSs.
[2L] OFFSET	This prompt gives the flight crew access to the OFFSET page.
[3L] HOLD	This prompt gives access to the hold pages.
[4L] ENABLE ALTN	This prompt allows the flight crew to switch to the alternate flight plan at the selected revision waypoint, and use it as a new active flight plan. The system never displays this prompt at the FROM waypoint.
[5L] ALTN	This prompt gives access to the alternate airport page. The system displays it only at the destination.
[6L] RETURN	This prompt returns the display to the flight plan page.
[1R] ARRIVAL	This prompt calls up the arrival pages, where RWY, APPR, STAR TRANS and VIA can be selected and inserted.

[1R] FIX INFO	FIX INFO is only displayed on the lateral revision page at the origin or FROM waypoint. It gives access to the FIX INFO page.
[2R] LLXING/INCR/NO	This prompt allows the flight crew to create the latitude/longitude crossing point. The increment (INCR) ranges from 1 to 20 °, and the number of crossing points from 1 to 99. This prompt is not displayed for waypoints belonging to the descent procedure.
[3R] NEXT WPT	The flight crew uses this prompt to enter the next waypoint. If this waypoint is a latitude/longitude, or is neither in the database nor in the flight crew-defined elements, the display reverts to the NEW WAYPOINT PAGE.
[4R] NEW DEST	The flight crew uses this prompt to enter a new destination.
[5R] AIRWAYS	The flight crew uses this prompt to access the AIRWAYS page.
[6R] INSERT	This prompt is displayed when the flight crew has created a temporary flight plan. It can be used to activate the temporary flight plan.

TEMPORARY REVISION

When the flight crew selects a lateral revision, the system creates a “Temporary F-PLN” and displays it in yellow on the MCDU, and as a dashed yellow line on the ND, enabling the flight crew to review the data before inserting it. As long as the temporary flight plan is not inserted, the previous the flight plan remains active and the system guides the aircraft along it.

FIX INFO PAGE

Ident.: DSC-22_20-50-10-25-00000565.0009001 / 14 MAY 12

10 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page provides access to the RADIAL, CIRCLE, and ABEAM intercept functions.
The reference may be a given database fix or a pilot-defined element.

If the radial, circle or abeam intercepts the active flight plan, the intersection point can be converted to a waypoint and inserted into the flight plan.
The FIX INFO page may be accessed from the LAT REV page at the origin airport, or at FROM.

[1L] REF FIX (blue)	Allows entries of the REF FIX. This reference may be any database element (navaid, waypoint, NDB, airport, runway) or a pilot-defined element. Prior to entry, amber boxes are displayed.

[2L] - [2R] RADIAL (blue) and [3L] - [3R] (blue)	Enables entry of a radial from the REF FIX. If the radial line intersects the active flight plan, the FMGS will compute the time, the along path DTG (Distance To Go), and the altitude at the intersection point (small green font). A large blue star is then displayed to insert the intersection waypoint into the flight plan. This waypoint is not part of the pilot-stored elements. Format of the created waypoint is: XXXNNN XXX = First 3 letters of REF FIX ident. NNN = Value of the radial
[4L] - [4R] RADIUS (blue)	This function enables the flight crew to enter a radius that defines a circle around the REF FIX. When the circle intercepts the current flight path, the FMGS will compute the time, the along path distance and the altitude at the first intersection point, from the current aircraft position (small green front). A large blue star is then displayed to insert the intersection waypoint into the flight plan. This waypoint is not part of the pilot stored element. The waypoint is automatically labelled: “DNNNXXX” NNN = Value of the radius XXX = First 3 letters of the REF FIX ident.
[5L] - [5R] ABEAM	This function enables the pilot to create waypoints on a flight plan (primary or secondary) that are abeam a reference fix. Once computed, the page displays the radial number in large green font. Time, distance and altitude predictions are displayed in small green font. Selecting the key adjacent to the star creates the waypoint and inserts it into the flight plan. The waypoint is identified by AB + the REF FIX ident e.g. AB TLS. Abeam waypoints are not stored in the pilot-stored waypoint database.

Note: *Four FIX INFO pages, providing the capability to define four different REF FIX elements, are available.*

OFFSET PAGE

Ident.: DSC-22_20-50-10-25-00013512.0019001 / 17 MAY 21

11 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page allows the flight crew to insert a preplanned offset into the flight plan by entering:
- A start waypoint
- An end waypoint

- An offset distance to the left or to the right
- The intercept angle value.

The flight crew calls up this page from the LATERAL REVISION page, by pressing [2L] key.

TITLE	OFFSET in white large font. If a temporary flight plan exists, it is displayed in yellow large font.
[1L] OFFSET	This field displays the lateral offset distance, left or right, in the flight plan. The offset may be between 1 and 50 NM. Blue brackets are displayed until an offset is inserted. When the flight crew enters an offset, or modifies another element in the OFFSET page, the OFFSET field becomes yellow. One time the temporary flight plan is inserted, the field becomes blue. The flight crew can delete an inserted offset either by pressing the CLR key, by entering a zero for the amount of the offset, or by pressing OFFSET DELETE in 6L field.
[2L] START WPT	The START WPT ident for the offset is displayed in yellow if a temporary flight plan exists, in blue if already inserted, or in green when the field is not modifiable. The default START WPT shall be the waypoint where the lateral revision is performed, the first waypoint offsettable, or PPOS if the offset is currently flown. This waypoint can also be selected from the list of waypoints in the fields 3L to 5L, or can be manually entered by the flight crew.
[3L] to [5L]	Display the start waypoints available for selection. Two scrolling list are available. The active start waypoint is displayed in green in the list. Other waypoints are displayed in blue. The currently selected start waypoint does not have selection arrow associated.

[6L] RETURN ERASE	RETURN: The flight crew presses this key to return to the last displayed LAT REV page. ERASE: It is displayed when a temporary flight plan has been created, and it enables the flight crew to erase the temporary flight plan.
[1R] INTCPT ANGLE	This field displays the intercept angle. The angle may be between 10 ° and 50 °. The intercept angle in the AMI is the default value, and is shown in blue. When the flight crew enters an intercept angle, or modifies another element in the OFFSET page, the field becomes yellow. When the temporary flight plan is inserted, the field becomes blue.
[2R] END WPT	The END WPT ident for the offset is displayed in yellow if a temporary flight plan exists, or in blue if already inserted. The default END WPT shall be the waypoint terminating the last consecutive offsettable leg from default or currently selected START WPT. This waypoint can also be selected from the list of waypoints in the fields 3R to 5R, or can be manually entered by the flight crew.
[3R] to [5R]	Display the end waypoints available for selection. Two scrolling lists are available. The active end waypoint is displayed in green in the lists. Other waypoints are displayed in blue. The currently selected end waypoint does not have selection arrow associated.
[6R] INSERT OFFSET DELETE	INSERT: This field allows the flight crew to activate the temporary flight plan and reverts the display to the active flight plan. This field is displayed when the offset segment is completely defined on OFFSET page. OFFSET DELETE: This prompt enables the flight crew to create a temporary flight plan where the predefined offset is canceled. This field is displayed when an offset exists in the active flight plan.

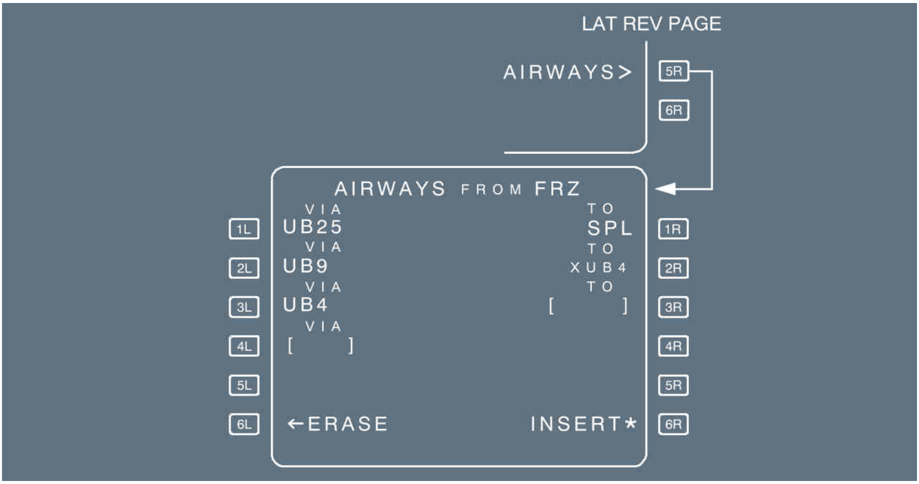
Note: *If the waypoint lists in lines 3 to 5 do not fit in one page, the flight crew can scroll in an open loop, two lines by two lines. To keep the initial order of the list, two markers appear:*
- *- START OF LIST - : This marker is displayed at the beginning of the list*
- *- END OF LIST - : This marker is displayed at the end of the list.*

AIRWAYS PAGE

Ident.: DSC-22_20-50-10-25-00000566.0009001 / 14 MAY 12

12 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page allows the pilot to select up to five airways for stringing into the flight plan, after the revise waypoint.
The pilot calls up this page by pressing the lateral revision page [5R] key.



TITLE	Revise point ident (large green font)
[1L] to [5L] VIA	This field displays the airways entered by the pilot.
[6L] ERASE or RETURN	The flight crew presses this key to return to the lateral revision page. This field displays ERASE when a temporary flight plan is created. It enables the temporary flight plan to be erased.
[1R] to [5R] TO	Displays the end points of the corresponding airways entered on the [1L] to [5L] entries. The ending point is displayed in large blue font, if manually-entered, in blue small font if FMGC-computed.
[6R] INSERT (amber)	Allows the entered VIA/TO segments to be inserted into the flight plan. The display reverts to the F-PLN page.

Note: 1. *If the entered airway contains at least one fixed radius transition waypoint as defined in the navigation database, and the TO waypoint is defined and, the fixed radius transition waypoint is in the flight plan, then, “FIXED TURN RADIUS AWY” is displayed between the VIA and TO fields.*
2. *If the condition for display “FIXED TURN RADIUS AWY” is satisfied for two consecutives airways lines, the second line displays (“) instead of the whole message.*

DEPARTURE PAGES

Ident.: DSC-22_20-50-10-25-00000567.0001001 / 17 MAR 11

13 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

These pages allow the pilot to review departure procedures (RWY, SID, TRANS) and enter them into the active flight plan.
When the display shows the lateral revision page for the origin, the pilot calls them up by pressing the 1L key.
Three pages are available: RWY, and SIDS and TRANS (if any).
The pilot sequentially calls up each page by selecting a data item (such as RWY), or by pressing the NEXT PAGE key on the MCDU console.

Line 1 RWY, SID TRANS	This line displays the RWY, SID, and TRANS in green after they have been inserted into the active flight plan, or in yellow if selected but not yet inserted. If nothing has been selected or inserted, the line displays dashes.

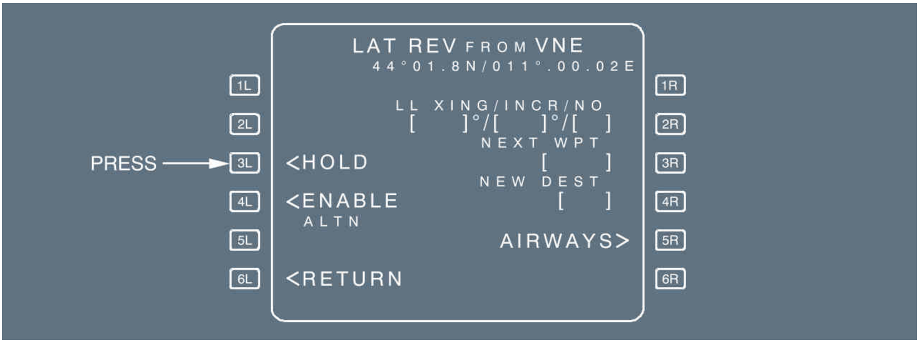
[2L] to [5L] RWY/SIDs	These fields display selectable and selected RWYs or SIDs (including EOSID and NO SID option). The pilot can slew each list. Selectable RWYs and SIDs are displayed in blue with an arrow. Once a RWY or SID is selected, the arrow disappears. A RWY or SID, already inserted in the flight plan, is displayed in green. The display shows the length, heading, and, if available, the ILS ident and frequency for each runway.
[6L] ERASE or RETURN	The pilot presses this key to erase a selected data item and revert to the previous selection. If the pilot erases the page, the display reverts to the active flight plan page. The display shows RETURN instead of ERASE, when the pilot has not created a temporary flight plan.
[2R] to [5R] TRANS	This field displays the selectable and selected enroute transitions in blue and green respectively. They are blank, if there are no transitions.
[6R] INSERT or BLANK	The pilot uses this key to insert a temporary procedure into the flight plan. The page reverts to the active flight plan page, when the insertion is completed. It is associated with RETURN (6L).
[6M] EOSID	Once a runway is inserted into the flight plan, this field displays any ENG OUT SID for that runway. If there is none, it displays NONE.

HOLD PAGES

Ident.: DSC-22_20-50-10-25-00000568.0001001 / 01 OCT 12

14 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

These pages allow the pilot to review and modify the holding pattern parameters at the selected revise waypoint.
The flight crew calls up these pages by pressing the HOLD key on the LAT REV page for the waypoint. The flight crew can insert database hold, holds computed by the FMS or holds that they manually define.



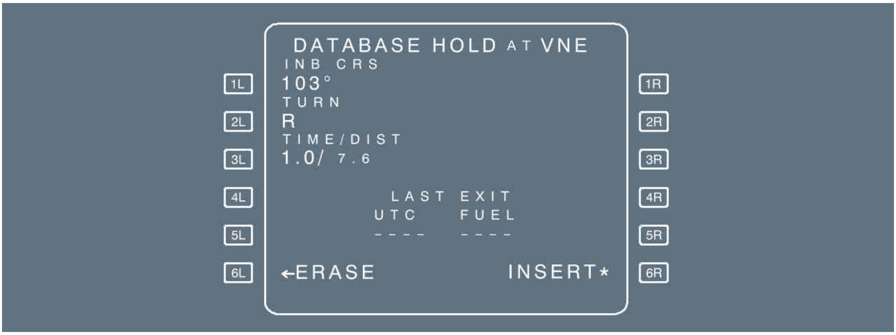
PRESS → 3L

```
        LAT REV FROM VNE
     44°01.8N/011°.00.02E
          LL XING/INCR/NO
       [    ]°/[    ]°/[  ]
                   NEXT WPT
<HOLD                 [    ]
                   NEW DEST
<ENABLE                 [  ]
 ALTN
                  AIRWAYS>
<RETURN
```

At first access, the HOLD page appears as follow:

DATABASE HOLD

If a hold is defined in the navigation database for the revised waypoint, and can be inserted, the parameters in [1L], [2L] and [3L] appear in yellow.



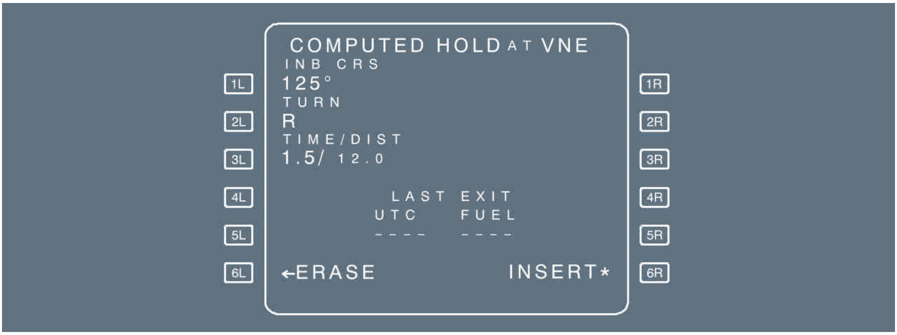
```
  DATABASE HOLD AT VNE
INB CRS
103°
TURN
R
TIME/DIST
1.0/ 7.6

          LAST   EXIT
         UTC     FUEL
         ----    ----

←ERASE           INSERT*
```

COMPUTED HOLD

If a default hold is computed by the FMS and can be inserted, the parameters in [1L], [2L] and [3L] appear in yellow.



COMPUTED HOLD AT VNE
INB CRS
125°
TURN
R
TIME/DIST
1.5/ 12.0

←ERASE INSERT*

A computed hold has the following default parameters:

[1L] INB CRS	Inbound track of the F-PLN leg leading to the revised waypoint
[2L] TURN	Direction right (R) to turn in the hold
[3L] TIME/DIST	TIME on outbound leg is 1.5 min above 14 000 ft, 1 min below 14 000 ft.
[2R]	This field shows “REVERT TO COMPUTED” when the flight crew has modified the holding pattern.

HOLD MODIFIED BY FLIGHT CREW

If the flight plan contains a holding pattern that was defined by the pilot from an existing database or computed hold, the parameters in [1L], [2L] and [3L] appear in blue.
If the pilot has modified holding pattern data from the database, the field next to [2R] displays “REVERT TO DATABASE” or “REVERT TO COMPUTED” to enable the pilot to revert to default parameters.

---- ----
←ERASE INSERT*

[1L] INB CRS	This field displays the inbound course of the holding pattern. The data may be manually or automatically modified.
[2L] TURN	This field shows the direction to turn in the hold (L or R). The data may be modified.
[3L] TIME/DIST	This field shows the time and distance for the outbound leg. The data may be modified, but time and distance cannot be entered simultaneously. Time and distance are dependent values that the system calculates from the predicted true airspeed, which in turn depends upon the holding speed (speed for maximum endurance, ICAO speed limit, or constraint speed, whichever is lower).
[6L] ERASE or RETURN	The pilot presses this key when the field shows “ERASE”, to erase the holding pattern. The pilot presses this key when the field shows “RETURN”, to return to the LAT REV page, if the hold is already inserted in the flight plan.
[2R] REVERT TO...	The pilot presses this key to delete manual modifications to the database hold (or computed hold), and to revert to the database (or computed) holding data.

[6R] INSERT	The pilot presses this key to insert the hold into the active flight plan.
LAST EXIT UTC FUEL	This field displays the time at which the aircraft must leave the holding pattern in order to meet fuel policy criteria (extra fuel = 0). The system also displays the estimated fuel on board at that time. Always displayed in thousand of kilograms or pounds.

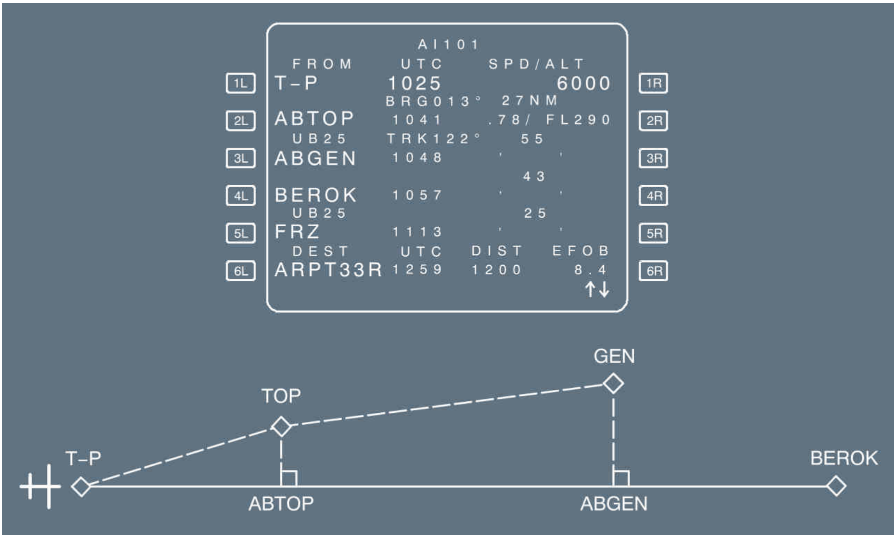
1R 2R 3R 4R 5R 6R

Pressing the “DIR” key under the MCDU screen brings up the DIR TO page. On this page, the [1L] key is the DIR TO key. The pilot presses it to modify the flight plan by creating a direct leg from the aircraft's present position to any selected waypoint. When in NAV mode, the pilot must use this key to modify the active leg or the TO waypoint. The pilot cannot call up this page when the aircraft's present position is not valid.

[1L] DIR TO	Pressing this key selects the DIRECT TO or INTERCEPT waypoint. The pilot can identify the waypoint to be inserted by using its identifier, its latitude and longitude, place/bearing/distance, or place-bearing/place-bearing. *Note: If the entered DIR TO is a latitude/longitude, the NEW WAYPOINT page is automatically called up.* If the pilot does not select the RADIAL IN (1R) or RADIAL OUT (2R) or ABEAM PTS (2L), the DIR TO function routes the aircraft from the present position to the waypoint inserted in the DIR TO field.
Line 3 to Line 6	These lines display the active flight plan with time/speed/distance predictions. The display may be slewed ↑ ↓. Pressing any key activates the DIRECT TO function from the present position to the waypoint adjacent to that key.
[2L] ABEAM PTS	The flight crew presses this key to activate the DIR TO/ABEAM function which projects the flight plan waypoints perpendiculary on the DIR TO leg:

EXAMPLE: DIR TO BEROK - ABEAM.



```

                              ↑↓
```

[1R] RADIAL IN and [2R] RADIAL OUT	The pilot fills in these fields to define a radial, associated to the waypoint defined in 1L. These keys respectively activate the DIR TO/INTERCEPT TO and DIR TO/INTERCEPT FROM functions. The pilot enters the radial in, or radial out, as : XXX, XXX being the radial. The aircraft intercepts from its current position and tracks the selected waypoint and radial to (or from) this waypoint.

<u>EXAMPLE: RADIAL INBND - DIR TO BEROK - RADIAL 270 ° INBOUND</u>

                          ↑↓
```

If the DIR TO/INTCPT WPT entry is to a waypoint already in the flight plan, a default RADIAL IN is displayed in small font. However, no radial is displayed on the ND for this default radial. No default radial is provided for the RADIAL OUT field.

Selecting the INTCPT TO (RADIAL IN [1R]) function:
- Activates the intercept radial INTO the WPT.
- Sets the course = radial IN + 180 °.
- Reverts the display to the F-PLN A page.

Selecting the INTCPT FROM (RADIAL OUT [2R]) function:

- Activates the intercept radial FROM the WPT.
- Sets the course = radial OUT.
- Reverts the display to F-PLN A page.

For details, DSC_22_20_30 Flight Planning.

Note: *It is not recommended to use the DIR TO function when the aircraft is on the ground. The use of the DIR TO function when the aircraft is on the ground may result in the loss of all departure data, that includes both of the following:*

- *The takeoff speeds*
- *The derated level, or the flexible temperature.*

ARRIVAL PAGES

16 Ident.: DSC-22_20-50-10-25-00000570.0024001 / 04 NOV 22
Applicable to: MSN 10949-11597

These pages enable the flight crew to review arrival procedures (approaches, VIAs, STARs, TRANS) and enter them into the active flight plan.
The flight crew presses the [1R] key from the LAT REV page for the destination to access the ARRIVAL pages.
Three pages, APPR, STAR, and VIA, are available, along with a fourth, TRANS, if there are any transitions.
The flight crew either selects a data item (such as APPR), or presses the NEXT PAGE on the MCDU to access the next pages sequentially.

Line [1L] - [1R] [2R]	This line displays the APPR, VIA, STAR, and TRANS in green, if they are inserted in the flight plan, and in yellow, as a temporary flight plan, if they are selected but not yet inserted. It displays dashes or NONE, if nothing is selected or inserted.
[2L] APPR VIAS	The flight crew presses this key to access to transitions from the last point of the STAR to the first point of the approach.

[3L] to [5L]	These fields list selectable and selected APPRs, STARs, and VIAs. The flight crew can slew the pages, when necessary. The FMS displays the APPRs, STARs, and VIAs that are available for selection in blue with an arrow. The arrow disappears when the flight crew selects an APPR, STAR, or VIA. The flight crew inserts into the flight plan the APPR, STAR, or VIA and then the FMS displays the APPR, STAR, or VIA in green on the ARRIVAL page. The list of VIAs available on the APPROACH VIAS page is composed of: - The VIAs compatible with the selected STAR, displayed below the "APPR VIAS AVAILABLE" subtitle - The VIAs not compatible with the selected STAR, but compatible with the selected APPR, displayed below the "OTHER APPR VIAS" subtitle. If only one VIA is compatible with the selected STAR, then the VIA is automatically selected in VIA field on the ARRIVAL page. For each approach, the display shows runway length, heading, and the frequency and identifier of the ILS or the channel and identifier of the GLS ◁ when ILS or GLS ◁ is available. When SLS ◁ is available, for RNAV(GNSS) approach with LPV or LP minima, the LPV-LP tag is added next to the runway length (whether the approach is with LP or with LPV minima), and the SLS tag is added below the LPV-LP tag. SLS ident and channel are displayed on the left of SLS tag. In the case of multiple approaches for the same runway, the approach is identified with the runway plus the multiple indicator (i.e. ILS 33L-S).
[6L] ERASE or RETURN	The flight crew presses this key to erase selected data and to revert to the previous selection. The page reverts to the LAT REV page. The field displays RETURN, instead of ERASE, when the flight crew has not created a temporary flight plan.
[3R] TRANS to [5R]	These fields display selectable and selected enroute transitions (if any). They are blue when selected, and become green when inserted into the active flight plan.
[6R] INSERT	The flight crew presses this key to insert the temporary procedure into the active flight plan. The page reverts to the active flight plan page when this occurs.

ARRIVAL PAGES

17 Ident.: DSC-22_20-50-10-25-00000570.0017001 / 04 NOV 22

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

These pages enable the flight crew to review arrival procedures (approaches, VIAs, STARs, TRANS) and enter them into the active flight plan.

The flight crew presses the [1R] key from the LAT REV page for the destination to access the ARRIVAL pages.
Three pages, APPR, STAR, and VIA, are available, along with a fourth, TRANS, if there are any transitions.
The flight crew either selects a data item (such as APPR), or presses the NEXT PAGE on the MCDU to access the next pages sequentially.

Line [1L] - [1R] [2R]	This line displays the APPR, VIA, STAR, and TRANS in green, if they are inserted in the flight plan, and in yellow, as a temporary flight plan, if they are selected but not yet inserted. It displays dashes or NONE, if nothing is selected or inserted.
[2L] APPR VIAS	The flight crew presses this key to access transitions from the last point of the STAR to the first point of the approach.
[3L] to [5L]	These fields list selectable and selected APPRs, STARs, and VIAs. The flight crew can slew the pages, when necessary. The FMS displays the APPRs, STARs, and VIAs that are available for selection in blue with an arrow. The arrow disappears when the flight crew selects an APPR, STAR, or VIA. The flight crew inserts into the flight plan the APPR, STAR, or VIA and then the FMS displays the APPR, STAR, or VIA in green on the ARRIVAL page. The list of VIAs available on the APPROACH VIAS page is composed of VIAs compatible with the selected STAR. If only one VIA is compatible with the selected STAR, then the VIA is automatically selected in VIA field on the ARRIVAL page. For each approach, the display shows runway length, heading, and the frequency and identifier of the ILS or the channel and identifier of the GLS ◁ when ILS or GLS ◁ is available. When SLS ◁ is available, for RNAV(GNSS) approach with LPV or LP minima, the LPV-LP tag is added next to the runway length (whether the approach is with LP or with LPV minima), and the SLS tag is added below the LPV-LP tag. SLS ◁ ident and channel are displayed on the left of SLS tag. In the case of multiple approaches for the same runway, the approach is identified with the runway plus the multiple indicator (i.e. ILS 33L-S).
[6L] ERASE or RETURN	The flight crew presses this key to erase selected data and to revert to the previous selection. The page reverts to the LAT REV page. The field displays RETURN, instead of ERASE, when the flight crew has not created a temporary flight plan.

[3R] TRANS to [5R]	These fields display selectable and selected enroute transitions (if any). They are blue when selected, and become green when inserted into the active flight plan.
[6R] INSERT	The flight crew presses this key to insert the temporary procedure into the active flight plan. The page reverts to the active flight plan page when this occurs.

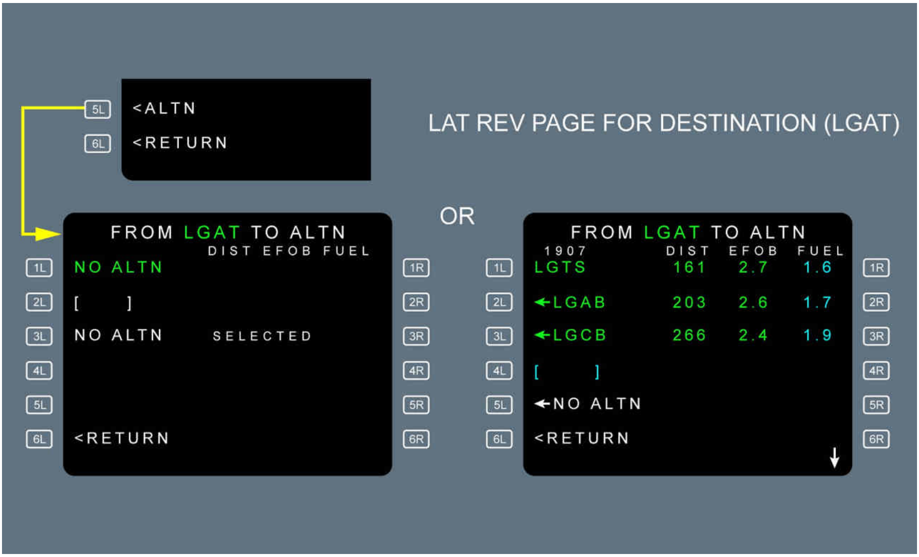
ALTERNATE PAGE

Ident.: DSC-22_20-50-10-25-00005710.0003001 / 30 AUG 18

18 **Applicable to: MSN 10949-11597**

This page enables the flight crew to check, in the NAV database, the alternate airports that are associated with the destination, and define additional alternates, if needed (Alternate airports are associated to the destination). The pilot displays this page with the ALTN prompt, from the lateral revision page for the destination.



```

TITLE	The destination airport appears in a large green font.
[1L] ALTN	This field displays the selected alternate airport: In green, if it is active. In yellow, if it is temporary. “NO ALTN” appears, if the flight crew selects NO ALTN, or if the destination has no alternate airport.
Line 2 to line 5	These lines display the navigation database alternates (up to 6) and/or associated company routes and other alternate possibilities (up to 3, pilot entry). For each alternate identification, all the following apply: - DIST: Distance between destination and alternate, great circle distance, or company route distance if any - EFOB: Extra fuel weight that remains after landing at the alternate - FUEL: Fuel weight required to go from destination to alternate. The value is inserted, modified, or cleared by the flight crew. When the database defines a preferred alternate, it is displayed on Line 2 (if the flight crew has not scrolled).

ALTERNATE PAGE

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

19 This page enables the flight crew to review, in the NAV database, the alternate airports that are paired with the destination, and define additional alternates, if needed. (Alternate airports are linked to the destination). The flight crew calls up this page with the ALTN prompt, from the lateral revision page for the destination.

TITLE	The destination airport is displayed large green font.
[1L] ALTN	This field displays the selected alternate: In green, if it is active; in yellow, if it is temporary. “NONE” is displayed, if NO ALTN option is selected, or if the destination has no alternate.
Line 2 to line 5	These lines display the identifications of alternates (up to 6), the extra fuel weight remaining after landing at the alternates, and the great-circle track and distances to them from the destination. If the database contains a company route between the destination and the alternate, the distance shown is an airway distance, not a great-circle distance. When the database defines a preferred alternate, it is displayed on Line 2 (if no scrolling has been performed).

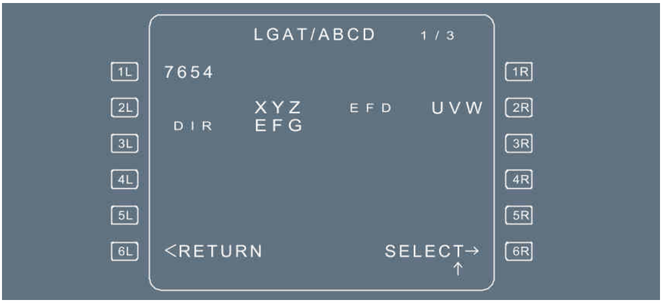
[4L] OTHER ALTN	The flight crew can enter an airport identifier in the brackets (Line 3). If that airport is not stored in the database , the NEW RUNWAY page appears for the flight crew to use in defining it. If it is stored in the database, the ROUTE SELECTION page appears, and the flight crew can use it to select the best route. The flight crew may enter a distance in the DIST field of the OTHER ALTN prompt, in order to get preliminary fuel predictions. However, once the flight crew has selected the alternate airfield as a temporary alternate and then inserted it, the ALTN distance reverts either to the airway distance, if the flight crew has selected a company route, or otherwise to the direct distance to the alternate. The flight crew can use OTHER ALTN to overwrite and replace the previous OTHER ALTN.
NO ALTN	The flight crew uses this key to select the NO ALTN option.
[6L] RETURN or ERASE	The flight crew presses this key to make the display revert to the LAT REV page. Pressing this key erases the temporary selection.
[1R] CO RTE	Pressing this key displays the active company route between the destination and the selected alternate.
[6R] INSERT	Pressing this key activates the temporary selection.

ROUTE SELECTION PAGE FOR ALTERNATE

Ident.: DSC-22_20-50-10-25-00000572.0001001 / 17 MAR 11

20 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page enables the pilot to review the company route between the destination and the alternate, and to select a different route, if that seems appropriate.
This page comes up automatically, when the flight crew enters an ident in the OTHER ALTN field.
See the “Route Selection” page *Refer to DSC-22_20-50-10-25 Route Selection Page*for a description of this page.



```
          LGAT/ABCD      1/3
7654
             XYZ     EFD    UVW
DIR          EFG

<RETURN                SELECT→
                             ↑
```

[6R] SELECT	Pressing this key reverts the display to the alternate page. (The distance between the destination and the alternate is then the airway distance).

VERTICAL REVISION PAGES

Ident.: DSC-22_20-50-10-25-00000573.0001001 / 04 DEC 18

21 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

These pages contain the menu of available vertical flight plan revisions that can be applied at a selected waypoint.
The pilot calls up these pages from the flight plan A or B pages by pressing the right hand key next to the selected revised waypoint.
The pilot may make several different vertical revisions (although some may not be available at all waypoints): Speed limit, speed constraint, altitude constraint, time constraint, wind page and STEP ALTS page.

TITLE	“VERT REV AT [location]” The second line shows remaining fuel and extra fuel at the waypoint being revised. From FMS2 release 2 the second line does not exist.
[1L] “TOO STEEP PATH BEYOND”	This message appears if the waypoint is part of a leg with a descent path that is too steep.

[2L] CLB/DES SPD LIM	This field displays the speed limit applicable to the climb or descent phase. It displays it in large font when data has been inserted manually, and in small font when data comes from the database.
[3L] SPD CSTR	This field displays any speed constraint assigned to the revised waypoint. It is in large font when inserted manually, and in small font when it comes from the database. It is not displayed at the origin airport, at a FROM waypoint, a speed limit pseudo waypoint, or the destination airport.
[4L] QNH	This field only functions when the revised waypoint is the primary destination. It allows the pilot to enter the atmospheric pressure at sea level. This field is identical to the QNH field of the PERF APPR page.
[4L] MACH/START WPT	This prompt allows the pilot to enter or modify the start point of a constant Mach segment, and its associated Mach. It is not displayed at primary destination and alternate flight plan waypoints. (*Refer to DSC-22_20-30-20-25 Constant Mach Segment - Entering a Constant Mach Segment*).
[5L] WIND	The pilot presses this key to access the wind pages. The first wind displayed page, corresponds to the selected waypoint (e.g. climb page), if the selected waypoint is a climb phase waypoint. A CLR action reverts it to brackets.
[6L] RETURN or CLB	The pilot presses this key to return to the last displayed flight plan page. When displayed, pressing this key assigns the constraint to CLB phase and inserts it into the vertical flight plan. The page reverts to the flight plan page.
[2R] RTA prompt	This prompt gives access to the RTA page. It is not displayed when the VERT REV page is accessed from the alternate F-PLN.
[3R] ALT CSTR	This field displays the altitude constraint assigned to this revised waypoint. It uses large font when the constraint is manually-entered, and small font when it is from the database. A CLR action reverts it to brackets. The constraint may be: - “At”, entered as XXXXX (Example: FL 180). - “At or above”, entered as + XXXXX or XXXXX + (Example: FL +310). - “At or below”, entered as – XXXXX or XXXXX – (Example: -5 000). - A “window” constraint. The altitude window consists of two altitudes between which the aircraft should fly. The crew cannot manually enter a “window” constraint.

G/S INTCP	This field displays the glide intercept altitude for an ILS approach on the vertical revision page at destination.
[4R] ALT ERROR	When the aircraft misses a predicted altitude constraint, this field displays the difference between the altitude constraint and the predicted altitude. If, for example, "-500" appears in this field in green, the aircraft will reach the waypoint at an altitude 500 ft below the constraint altitude. This only applies to waypoints in the climb and descent phases.
[4R] END WPT	This prompt allows the pilot to enter or modify the endpoint of a constant Mach segment. It is displayed when a pair Mach/start exists in 4L field. This prompt is not displayed on the destination VERT REV page. (*Refer to DSC-22_20-30-20-25 Constant Mach Segment - Entering a Constant Mach Segment*).
[5R] STEP ALTS	This legend appears for any waypoint, once a cruise altitude has been entered. It is not available in engine-out, descent, approach, and go-around phases. This gives the pilot access to the STEP ALTS page.
[6R] DES	When this field displays "DES", pressing this key assigns the constraints to the descent phase and inserts them into the vertical flight plan. The page reverts to the F-PLN page. (See note below).

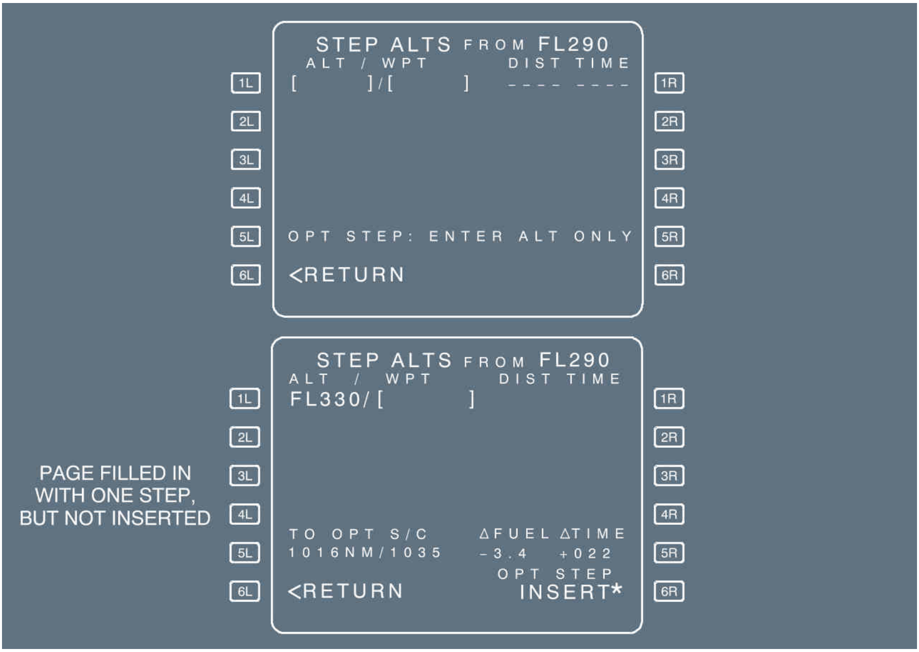
Note: *Altitude and speed constraints may apply to the climb, descent, or approach phase, but never to the cruise phase. Fields 6L/6R display "CLB/DES" when the revised waypoint is a cruise phase waypoint and the FMGS needs to know if the new constraint is to be applied in climb or descent phase. The FMGS will modify the cruise phase accordingly. These 2 prompts also display "CLB/DES" when the predictions are not computed. (Top of climb and top of descent not yet defined).*

STEP ALTS PAGE

Ident.: DSC-22_20-50-10-25-00000574.0009001 / 14 MAY 12

22 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page allows the pilot to insert up to four geographic step points and one optimal step point into the flight plan. This page also displays the fuel/time savings associated with the optional step.
The flight crew calls it up either from the vertical revision page.



```
    STEP ALTS FROM FL290

                       OPT STEP
<RETURN                 INSERT*
```

PAGE FILLED IN
WITH ONE STEP,
BUT NOT INSERTED

TITLE [1L] - [1R] [4L] - [4R]		STEP ALTS in white followed by the current cruise altitude in green.
ALT/WPT {blue}	:	The waypoint identifier, as well as the altitude to step, can be entered in this field. Both are displayed in large font. The waypoint may either be an active (or secondary) flight plan waypoint, or an inserted optimal point (OPT). When an entry is made, a temporary F-PLN is created.

DIST / TIME (UTC) (small green font)	Displays the distance to go, and time from the present aircraft position along the flight plan to the step point. *Note:* *The following messages may be displayed in the DIST/TIME field:* - *ABOVE MAX, if the step altitude exceeds the MAX altitude.* - *"IGNORED", if the step start or end point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.* - *"STEP AHEAD", when the aircraft is within 20 NM of the start step point.* - *"NO OPTIMAL" if a non inserted optimal step falls in a discontinuity due to a flight plan change, or when no new optimal exists after an UPDATE or when no optimal step point exists for the entered altitude.*

Note: *If no optimal step point exists for the altitude displayed in [1L], the "NO OPTIMAL" message is displayed in the FUEL/TIME field. This message is also displayed, if the optimal step falls into a discontinuity.*

[5L] OPT STEP: ENTER ONLY ALT (white) TO OPT S/C (green small front)	This field displays the distance and time to an uninserted optimal step point, if one exists. It is displayed to guide the flight crew for the entry format of an optional step. *Note:* *On any flight plan change, an inserted optimal step remains in the flight plan at a fixed distance to destination.*
[6L] RETURN	The flight crew presses this key to return to the previous page.
[5R] SAVINGS	This field displays the fuel and time savings prior to the insertion of the optimal step point. Fuel savings are displayed in thousand of kilograms (or pounds) (maxi 99.9). The value is preceded by: "–" in case of fuel saving, "+" in case of additional fuel cost. Time savings are displayed in hours and minutes. The value is preceded by "–" in case of time saving, "+" in case of additional time cost.

[6R] INSERT* (amber)	This field displays INSERT*, when an optimal step point exists but is not yet inserted. When INSERT is selected: - The optimal step point is inserted into the flight plan. - OPT is displayed in line 1L. - Optimal step distance and time are deleted in line 5L. - The UPDATE* blue prompt replaces the INSERT* prompt.
UPDATE*	This prompt enables the computation of another optimal step point. The UPDATE* prompt is then replaced by the INSERT* prompt.

RTA PAGE

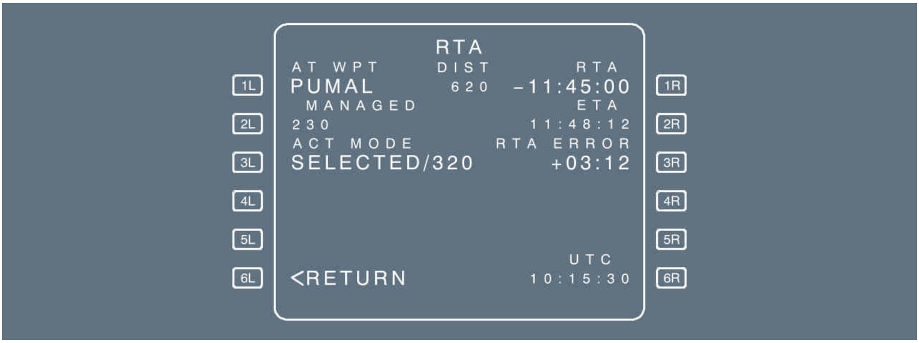
Ident.: DSC-22_20-50-10-25-00000575.0009001 / 14 MAY 12

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The Required Time of Arrival (RTA) page allows the entry and display of a waypoint identifier, with associated time constraints. The page also displays the entered or computed Estimated Takeoff Time (ETT), as well as the following data:

- Predicted ETA at the time-constrained waypoint;
- Performance adjusted SPD target;
- Time error;
- Distance to time constrained waypoint;
- Active speed mode;

The flight crew calls up this page with the RTA prompt from the vertical revision page.



```
               RTA
 AT WPT        DIST         RTA
PUMAL           620   -11:45:00

                            UTC
<RETURN                10:15:30
```

TITLE	RTA (large white font)

line 1	This line displays: - AT WPT, DIST and RTA when a time constraint can be defined. The identifier of the revised waypoint or the first following waypoint at which the time constraint can be defined, is displayed by default in large blue font - AT WPT, DIST and RTA when a time constraint has already been defined. The associated constrained waypoint identifier is displayed by default in large blue font - AT WPT and white dashes when no time constraint can be defined - AT WPT and blue brackets if a time constraint can only be introduced before the waypoint at which the VERT REV has been initiated. Only when the waypoint identifier has been defined (by the flight crew or by default), blue brackets and a blue start are displayed in [1R] field. The flight crew enters the time constraint as “HHMMSS”, preceded by: - for at or before; + for at or after; no sign for at.
[2L] MANAGED	This field displays the FMGS-computed ECON speed/Mach (*Refer to DSC-22_20-40-10 Optimization*)
[3L] ACT MODE	This field displays the active speed mode : MANAGED or SELECTED/NNN (NNN is the selected target speed). The pilot cannot modify it through this field.
[6L] RETURN	The pilot presses this key to revert the display to the VERT REV page.
[2R] ETA	When a required time at arrival has been defined, the 2R field displays the estimated time of arrival as “HHMMSS”.
[3R] RTA ERROR	This field is blank when the RTA is predicted as made. If the RTA is predicted as missed, “RTA ERROR” is displayed in small white font, and the time error between ETA and RTA is displayed in small amber font.
[6R] ETT	The Estimated Takeoff Time (ETT) field is available in the preflight phase. If no ETT is available, the 6R field displays blue brackets and a blue star. Once available, the ETT is displayed in magenta.
UTC	Universal time is displayed in green for takeoff, climb, cruise, descent and approach phases.

RTA PAGE

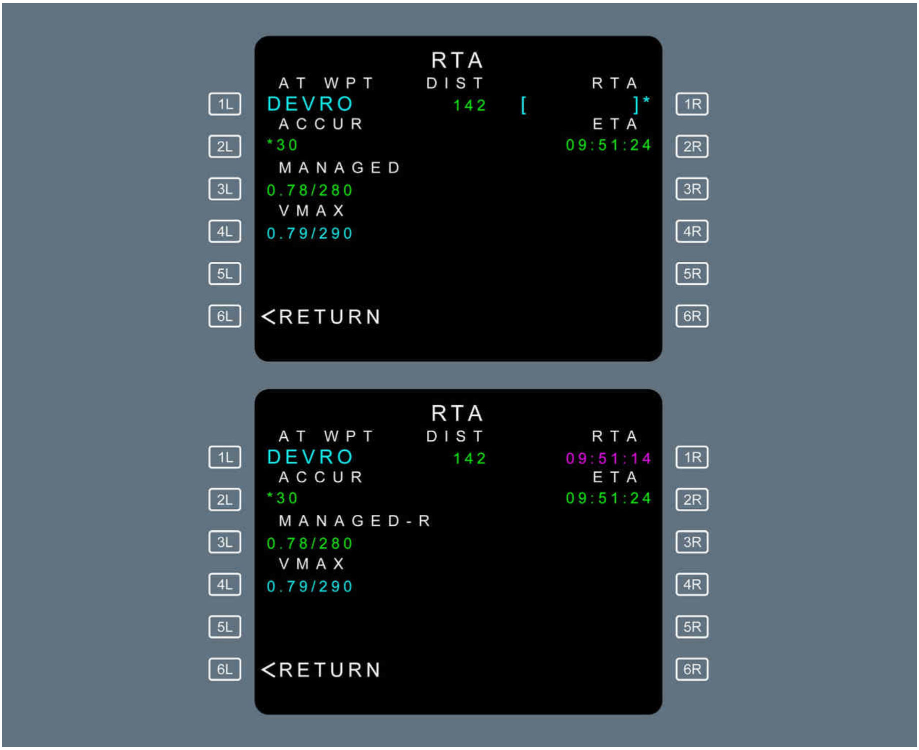
Ident.: DSC-22_20-50-10-25-00000575.0011001 / 26 NOV 19

23 **Applicable to: MSN 10949-11597**

The Required Time of Arrival (RTA) is a time constraint that must be respected at the revised waypoint.
On the RTA page, the flight crew can insert, modify or delete a RTA at a waypoint.

The RTA page allows the entry and display of a waypoint identifier, with associated time constraints and its accuracy. The page also allows the entry or display of the following data:
- Estimated Takeoff Time (ETT)
- Predicted ETA at the time-constrained waypoint
- Performance adjusted SPD target
- RTA error (in case of RTA missed)
- Distance to time constrained waypoint
- Maximum allowable RTA speed schedule (VMAX)

The flight crew calls up this page with the RTA prompt from the vertical revision page.



```
                RTA
 AT WPT        DIST                RTA
DEVRO           142     [            ]*
 ACCUR                             ETA

```

TITLE	RTA (large white font)

[1L] - [1R] AT WPT / DIST / RTA	This line displays: - AT WPT, and empty blue brackets facing the [1L] prompt, when no waypoint has been defined, or - AT WPT, DIST, and RTA when a waypoint has been defined. The waypoint identifier is displayed in blue font. If only the waypoint identifier has been defined, blue brackets and a blue star are displayed facing the [1R] prompt. The flight crew enters or loads the time constraint as "HHMMSS", preceded by: "-" for at or before "+" for at or after no sign for at. DIST is the distance to time constrained waypoint.
[2L] ACCUR	This field displays the RTA accuracy "30" in green font.
[3L] PREFLIGHT phase: ETT	This field displays the Estimated Takeoff Time (ETT). If no ETT is available, the [3L] field displays blue brackets and a blue star. Once available, the ETT is displayed in magenta.
[3L] Other flight phases: MANAGED	This field displays the managed speed. When RTA is active, MANAGED-R and managed speed for the RTA are displayed. In speed selected mode, this field is replaced by white dashes. In heading selected mode, this field is replaced by last RTA speed. When heading or speed is in SELECTED mode, RTA SPEED/MACH value is not used for guidance until activation of the MANAGED mode. When the constrained waypoint is sequenced, the ECON SPD/MACH is resumed unless the constrained waypoint is located in the descent segment (in this case, the RTA speed is kept). If the aircraft enters a holding pattern, the downpath time constraint is deleted.
[4L] VMAX	This field displays the maximum speed allowed for RTA guidance. This parameter is flight crew modifiable (MACH or CAS or both). If no specific VMAX is entered, the RTA speed will be restricted by the maximum speed envelope (MMO - 0.02 / VMO -10). _Note:_ *VMIN is not modifiable and corresponds to Green Dot or minimum maneuvering speed.*
[6L] RETURN	The flight crew presses this key to revert the display to the VERT REV page.
[2R] ETA	When a AT WPT has been defined, the [2R] field displays the estimated time of arrival as "HHMMSS".

[3R] RTA ERROR	This field is displayed in case the currently active RTA is predicted unachievable. The time error between ETA and RTA is displayed in small amber font. In addition, RTA MISSED AT XXX message is displayed in scratchpad.

DATA INDEX PAGES

Ident.: DSC-22_20-50-10-25-00000576.0001001 / 17 MAR 11

24 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

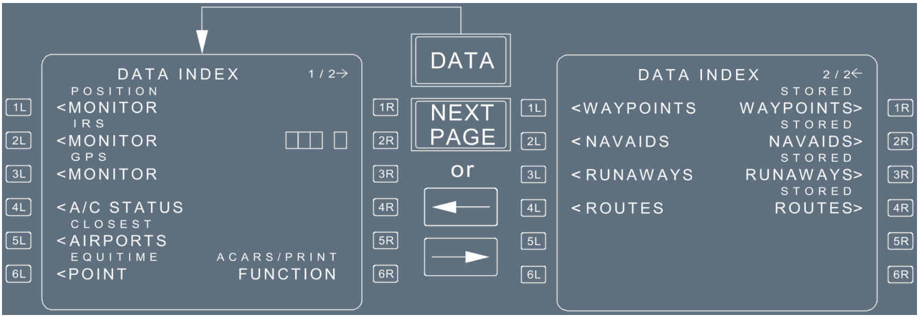
There are two INDEX pages:

The DATA INDEX 1/2 page gives access to various pages devoted to navigation.

The DATA INDEX 2/2 page lists the navigation data, entered in the FMGS.

The pilot enters those items labeled “stored” and can modify them. The pilot can call up the others, but cannot modify them.

The pilot calls up these pages by pressing the DATA key on the MCDU console:



DATA INDEX 1/2→

DATA INDEX 1/2 PAGE

[1L] POSITION MONITOR - [2L] IRS MONITOR	When the flight crew presses these keys, the display shows all essential navigation data.
[3L] GPS MONITOR	This key calls up the GPS MONITOR page.
[4L] A/C STATUS	This key calls up the aircraft status page.
[5L] CLOSEST AIRPORTS.	This key calls up the closest airports page.
[6L] EQUITIME POINT	This key calls up the equitime point page.
[6R] ACARS/PRINT	This key calls up the PRINT function pages and the ACARS function pages.

DATA INDEX 2/2 PAGE

[1L] WAYPOINTS [2L] NAVAIDS [3L] RUNWAYS [4L] ROUTES	These keys call up descriptions of waypoints, NAVAIDs, runways, and routes stored in the database, so that they can be reviewed.
[1R] STORED WAYPOINTS [2R] STORED NAVAIDS [3R] STORED RUNWAYS [4R] STORED ROUTES	These keys call up waypoints, NAVAIDs, runways, and routes that the pilot has stored, enabling the pilot to review and store them in, or delete them from, the database. The airline can choose to automatically have all pilot-stored data erased in the done phase.

WAYPOINT PAGE

- The pilot can call up this page by pressing the 1L key on the DATA INDEX page. The display then shows waypoint information associated with the identifier the flight crew inserts it in the [1L] field.
- With this page it is possible to call any waypoint not stored in the stored waypoint list, if they belong to the active, temporary, or secondary flight plan.

STORED WAYPOINT PAGE

The pilot calls up this page by pressing the 1R key on the DATA INDEX page.
This page displays waypoints, defined and stored by the pilot. It lists each stored waypoint, along with a number that shows the relative order in which it was inserted in the database. This number is displayed in the upper righthand corner of the page. For example, “1/20” indicates that the waypoint was the first of 20 stored.

Note: *Latitude/Longitude crossing points and Abeam/Radial Intercept points are never included in the stored waypoint list.*

[1L] IDENT	To delete a waypoint, the pilot clears the 1L ident display.
[2L] LAT/LONG	Latitude and longitude of the waypoint are displayed in this field.
[3L]	This field either displays PLACE/BRG/DIST or PLACE-BRG/ PLACE-BRG or PLACE/DIST, depending on how the waypoint was defined.
[5R] NEW WAYPOINT	The pilot presses this key to call up the NEW WAYPOINT page.
[6R] DELETE ALL	The pilot presses this key and the label changes to amber CONFIRM DELETE ALL. Pressing this key a second time deletes all the waypoints, stored by the flight crew, except those currently used in the active or secondary flight plan. (“F-PLN ELEMENT RETAINED” appears on the MCDU).

NEW WAYPOINT PAGE

- The flight crew displays this page by pressing the 5R key on the STORED WAYPOINT page.
- The flight crew uses this page to define and store waypoints. The maximum number of waypoints that it is possible to enter depends on the FMS standard. It is possible for these to be 20 or 99, and appears in the upper right corner of the STORED WAYPOINT page. For example, "1/20" indicates that 20 is the maximum number of waypoints that it is possible to store. If an additional waypoint is entered, then the first one is deleted.

The flight crew defines a waypoint by entering its ident in the data field next to 1L, then by entering its position in the amber boxes.

The STORE prompt appears next to 6R when the boxes are filled in, and the pilot presses the key to store the waypoint in the database.
If the pilot enters the waypoint's position as place/bearing/distance, or place-bearing/place-bearing, the FMGC computes its latitude and longitude.

2 (130NM)

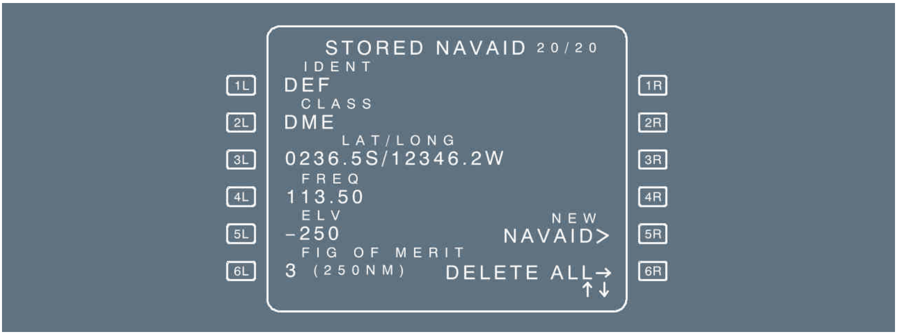
[2L] CLASS	This field identifies the NAVAID as VOR, DME, VOR DME, VORTAC, NDB, LOC, ILS, MLS, ILS/DME, MLS/DME, ILS/TAC or TACAN. It displays NON COLLOCATED, if the NAVAID is uncollocated.
[4L] FREQ or CHAN	CHAN is displayed, if the class of NAVAID is an MLS or an MLS DME.
[5L] ELV	This field gives the NAVAID elevation in feet above sea level. It is not displayed for VOR or NDB.
[6L] FIG OF MERIT	This field shows how far out the FMGS can autotune a VOR, VOR/DME, VORTAC, or DME for display or for computing position. 0 : up to 40 NM 1 : up to 70 NM 2 : up to 130 NM 3 : up to 250 NM

[1R] STATION DEC or RWY IDENT	This is the magnetic declination in the NAVAID area (used only for VOR, VOR/DME, and VORTAC). The field displays RWY IDENT, if the NAVAID is a LOC, ILS, MLS, ILS/DME, MLS/DME or ILS/TAC.
[2R] CATEGORY	This field shows the NAVAID's category, if it is an ILS, ILS/DME, MLS, MLS/DME or ILS/TAC. A LOC DME has a category = 0.
[3R] COURSE	This is the localizer course, if the NAVAID is an ILS or a LOC.
[6R] RETURN	This prompt is displayed, if the page has been accessed from the SELECTED NAVAID page. The pilot presses this key to return to the SELECTED NAVAID page.

STORED NAVAID PAGE

The pilot calls up this page by pressing the 2R key on the DATA INDEX page. This page is used to display or delete defined and stored NAVAIDs.



```
   STORED NAVAID 20/20
 IDENT
DEF
 CLASS
DME

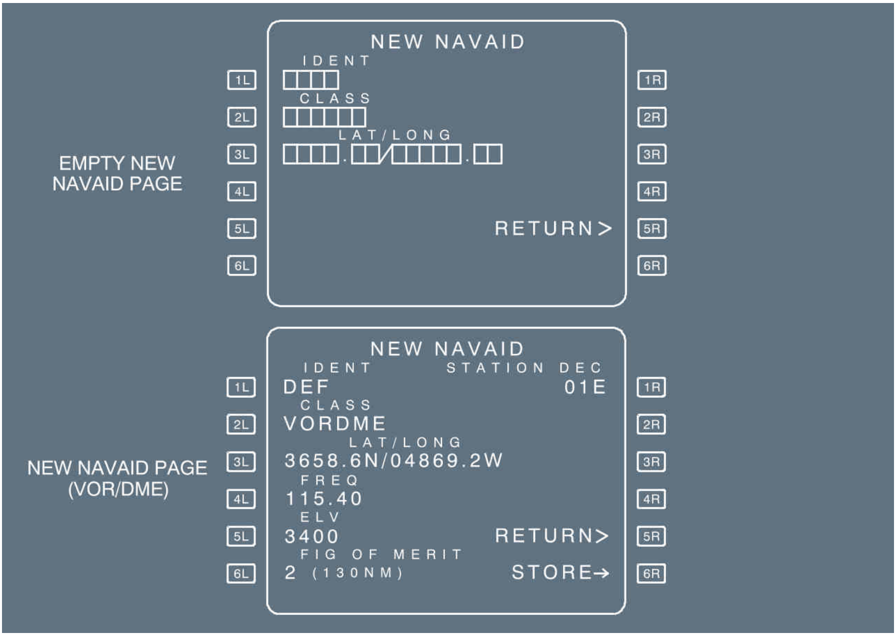
                       ↑↓
```

A number in the upper righthand corner of the screen shows the relative order in which the NAVAIDs were stored. (For example, 3/7 means the third out of the seven stored).
Slew keys give the pilot access to the different stored NAVAIDs.

[1L] IDENT	The pilot deletes a stored NAVAID by entering its ident in this field, then by pressing the CLR key at the bottom of the MCDU control panel.
[6R] DELETE ALL and CONFIRM DELETE ALL	The pilot presses this key to erase all the stored NAVAIDs, except those currently used in the active or secondary flight plan. (The MCDU displays “F-PLN ELEMENT RETAINED.”).

NEW NAVAID PAGE

The pilot calls up this page by pressing the 5R key on the STORED NAVAID page.



```
         NEW NAVAID
 IDENT
□□□□
 CLASS
□□□□□□
     LAT/LONG

3400                 RETURN>
 FIG OF MERIT
2 (130NM)             STORE→
```

It can be used to define and store up to 20 NAVAIDs. Entering an additional waypoint deletes the first one. The NAVAID elements must be entered in two steps:

1. Enter the data in the lines of amber boxes.
2. Enter frequency, elevation, figure of merit, and station declination or ILS category and course, if applicable.

<u>Note:</u> *The pilot cannot create an ILS/DME or an uncollocated NAVAID.*
If the runway associated with the ILS has been entered through the new runway page, the course, IDENT, and runway IDENT are already displayed on the new NAVAID page when it comes up (copied from the new runway page). For details, see the new runway page info below.

[1R] STATION DEC	The pilot must enter the magnetic declination, if the prompt is displayed. This prompt is displayed only for VOR, VORTAC or VOR/DME.
[3R] COURSE	If the NAVAID is an ILS, LOC, enter the course.
[6R] STORE	This prompt appears when all the amber boxes are filled in. The pilot presses the key to store the NAVAID.

A stored NAVAID is never used for position computation.

NEW RUNWAY PAGE
(MANUALLY COMPLETED)

RUNWAY PAGE

This page displays the following information:

[1L] IDENT	The runway IDENT, which comprises the airport identification and the runway direction, uses six or seven digits (Example: CYYZ 24L and LFRJ 08).
[2L] LAT/LONG	The latitude and longitude of the runway threshold.
[4L] LENGTH	The runway length in meters (M) or feet (ft), in five digits (9 999 ft).
[5L] ELV	The elevation of the threshold in feet above sea level.
[6L] CRS	The runway course (degrees magnetic).
[1R] LS IDENT	The LOC or ILS identifier.

STORED RUNWAY PAGE

The pilot uses this page to display or delete the defined and stored runways. The stored runways are listed and numbered in the order in which they were inserted. The number is displayed in the upper righthand corner of the page. (For example, 2/4 means the runway is the second of the four stored runways).
The pilot can delete any stored runway from the database by displaying its IDENT in the 1L field, then by pressing the CLR key on the MCDU control panel.

[6R] DELETE ALL and CONFIRM DELETE ALL	The pilot presses this key to erase all the stored runways, except those used in the active or secondary flight plan. (The MCDU displays “F-PLN ELEMENT RETAINED”).
[1L] to [6L]	These fields are similar to the RUNWAY page fields.

NEW RUNWAY PAGE

The pilot can use this page to define and store up to 10 runways.

- **When the pilot enters an ILS/LOC IDENT in the [1R] field the new NAVAID page comes up. When the pilot has entered and stored the necessary data in the new NAVAID page, the new runway page reappears.**

The new runway page and the new NAVAID page (ILS/LOC) are not independent:

- **When the flight crew first defines the ILS/LOC (on the new NAVAID page) the new runway page, when called up, already displays the RWY course, RWY IDENT, and ILS IDENT (copied from the new NAVAID page).**
- **When the flight crew first defines the runway (on the new runway page) the new NAVAID page, when called up, already displays the ILS course, ILS IDENT, and runway IDENT.**

The pilot must enter the two runway directions on two different new runway pages (Example: LFRJ 08 and LFRJ 26) to allow the flight plan to select either one.

Note: *When 10 runways are stored, entering a new stored runway deletes the first one of the list (1/10).*

[1L] to [6L]	Enter information about the new runway.
[1R] LS IDENT	Enter the ILS/LOC IDENT. The NEW NAVAID page comes up.
[5R] RETURN	The pilot presses this key to return to the NEW NAVAID page.
[6R] STORE	This prompt only appears when all the amber boxes have been filled in.

Note: *The NEW RUNWAY may be used for departure or destination, but no SID or STAR can be associated or stored with this runway. Therefore, the pilot will use it as an “independent” airport.*
A new runway is identified by the 4–letter ICAO airport identifier, although all six or seven digits must be entered.

RUNWAY PAGE

This page displays the following information:

[1L] IDENT	The runway IDENT, which comprises the airport identification and the runway direction, uses six or seven digits (Example: CYYZ 24L and LFRJ 08).
[2L] LAT/LONG	The latitude and longitude of the runway threshold.
[4L] LENGTH	The runway length in meters (M) or feet (ft), in five digits (9 999 ft).
[5L] ELV	The elevation of the threshold in feet above sea level.
[6L] CRS	The runway course (degrees magnetic).
[1R] LS IDENT	The LOC or ILS identifier.

STORED RUNWAY PAGE

The pilot uses this page to display or delete the defined and stored runways. The stored runways are listed and numbered in the order in which they were inserted. The number is displayed in the upper righthand corner of the page. (For example, 2/4 means the runway is the second of the four stored runways).
The pilot can delete any stored runway from the database by displaying its IDENT in the 1L field, then by pressing the CLR key on the MCDU control panel.

[6R] DELETE ALL and CONFIRM DELETE ALL	The pilot presses this key to erase all the stored runways, except those used in the active or secondary flight plan. (The MCDU displays “F-PLN ELEMENT RETAINED”).
[1L] to [6L]	These fields are similar to the RUNWAY page fields.

NEW RUNWAY PAGE

The pilot can use this page to define and store up to 10 runways.

- **When the pilot enters an ILS/LOC IDENT in the [1R] field the new NAVAID page comes up. When the pilot has entered and stored the necessary data in the new NAVAID page, the new runway page reappears.**

The new runway page and the new NAVAID page (ILS/LOC) are not independent:

- **When the flight crew first defines the ILS/LOC (on the new NAVAID page) the new runway page, when called up, already displays the RWY course, RWY IDENT, and ILS IDENT (copied from the new NAVAID page).**
- **When the flight crew first defines the runway (on the new runway page) the new NAVAID page, when called up, already displays the ILS course, ILS IDENT, and runway IDENT.**

The pilot must enter the two runway directions on two different new runway pages (Example: LFRJ 08 and LFRJ 26) to allow the flight plan to select either one.

Note: *When 10 runways are stored, entering a new stored runway deletes the first one of the list (1/10).*

[1L] to [6L]	Enter information about the new runway.
[1R] LS IDENT	Enter the ILS/LOC IDENT. The NEW NAVAID page comes up.
[5R] RETURN	The pilot presses this key to return to the NEW NAVAID page.
[6R] STORE	This prompt only appears when all the amber boxes have been filled in.

Note: *The NEW RUNWAY may be used for departure or destination, but no SID or STAR can be associated or stored with this runway. Therefore, the pilot will use it as an “independent” airport.*
A new runway is identified by the 4–letter ICAO airport identifier, although all six or seven digits must be entered.

ROUTE PAGES

(Not-modifiable)

[1L] CO RTE	Any company route IDENT, entered in this field, causes all the elements of the route to be displayed.
Line 2 to Line 6	These lines display the various route elements, including waypoints and airways.
[1R] FROM/TO	This field is automatically filled in, when the pilot enters the IDENT for a company route. When the pilot manually enters a city pair, the MCDU displays “NOT IN DATA BASE” if the city pair is not in the navigation database. If the city pair is in the database, the CO RTE field displays the first route stored (small blue font). If more than one route is stored, the pilot can slew to see the different routes.

STORED ROUTE PAGE

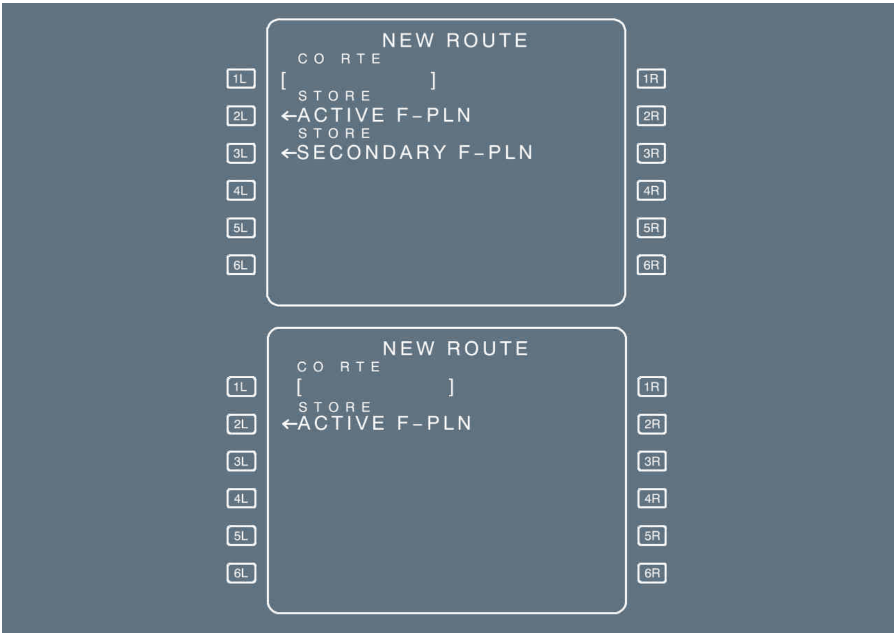
                          NEW
←DELETE ALL            ROUTE>
```

This page displays up to 5 routes, stored by the pilot. The stored routes are listed and numbered in the order of insertion. The number is displayed in the upper right-hand corner of the page.

[1L] CO RTE	This field identifies the stored route. Clearing this field deletes the stored route.
Line 2 to Line 5	The fields in these lines are identical to the corresponding fields in the route page.
[6L] DELETE ALL	Pressing this key changes the label to amber CONFIRM DELETE ALL. Pressing this key a second time deletes all previously-stored routes.
[1R] FROM/TO	This identifies the city pair of the stored route.
[6R] NEW ROUTE	Pressing this key calls up the new route page.

NEW ROUTE PAGE

The pilot calls up this page by pressing the NEW ROUTE key on the stored route page. It can be used to store up to five new routes that have already been defined in the active or secondary flight plan.



NEW ROUTE
CO RTE

←SECONDARY F-PLN

NEW ROUTE
CO RTE
[ ]
STORE
←ACTIVE F-PLN

[1L] CO RTE	This field enables the pilot to enter a new company route IDENT. If that IDENT has already been assigned, the entry is rejected.
[2L] STORE ACTIVE F-PLN (blue)	Pressing this key stores parameters of the active flight plan as new route. The display shows this prompt when the system contains a FROM/TO, but only during preflight.
[3L] STORE SECONDARY F-PLN (blue)	Pressing this key stores parameters of the secondary flight plan as new route. The display shows this prompt when the system contains a FROM/TO and the secondary flight plan has not yet been sequenced.

Note:
- *If it has not already been named, a stored route is automatically named when stored: SRTE 1 to SRTE 5.*
- *When 5 routes are already stored, the pilot cannot insert a new stored route. The "STORED ROUTE FULL" message is displayed, and the pilot must manually delete a route in order to store a new one.*
- *Several flight plan elements are not retained when the route is stored:*
  - *Pilot-entered holds*
  - *Offset*
  - *Pilot-entered constraints*
  - *Modifications to terminal procedures*
  - *Pseudo-waypoints*
  - *Step at optimum.*
  - *Pilot-entered constant Mach segment.*
    The MCDU then displays "REVISIONS NOT STORED".

AIRCRAFT STATUS PAGE

 IDLE/PERF           SOFTWARE
 +0.0/+0.0      STATUS/XLOAD>
```

TITLE	AIRCRAFT TYPE
[1L] ENGINE TYPE	The system uses this to calculate predictions.

Note: *When the same performance database is used for various aircraft configurations, the aircraft or engine type displayed in the [1L] field may differ from the actual aircraft.*

[2L] ACTIVE DATABASE	The display shows the validity period and part number of the navigation database in large font.
[3L] SECOND DATABASE	The display shows the validity period of the second navigation database in small font. If the key is pressed, the CONFIRM and CANCEL prompts appear. The flight crew must press the key to confirm or cancel the switching to second navigation database.

CAUTION	Cycling the database erases the primary and secondary flight plans, as well as stored data. The flight crew must never do this in flight.

[5L] CHG CODE	The maintenance crew can modify the IDLE/PERF factor displayed in [6L] field. This field is displayed in the PREFLIGHT and DONE phases. The label is displayed in small font. The brackets, or the entered value, is displayed in large font.
[6L] IDLE/PERF	It is only possible to modify these factors when the aircraft is on ground. If no value has been entered, the FMS displays default values coded in the AMI file. Default values are displayed in small font, although manually entered values are displayed in large font. When it is necessary to modify the IDLE or the PERF factor, *Refer to DSC-22_20-40-30 Procedure to Modify the PERF and IDLE Factors (on Ground only)*.
[4R] STORED	This field displays pilot-stored data in large font. The field is blank if no data is stored. The airline can choose to have this data automatically erased at the done phase.
[5R] DELETE ALL	Pressing this key changes the label to CONFIRM DELETE ALL. Pressing this key a second time deletes all pilot-stored data, except data that is part of the active and secondary flight plans.
[6R] STATUS/XLOAD	This prompt gives access to the P/N STATUS and P/N XLOAD pages.

TITLE	AIRCRAFT TYPE
[1L] ENGINE TYPE	The system uses this to calculate predictions.

Note: *When the same performance database is used for various aircraft configurations, the aircraft type displayed may differ from the actual aircraft.*

[2L] ACTIVE DATABASE	The validity period and part number are displayed in large font.
[3L] SECOND DATABASE	The validity period is displayed in small font. The pilot can press the 3L key to switch to the second database as the active database.

CAUTION	Cycling the database erases the primary and secondary flight plans, as well as the stored data. The flight crew must never do this in flight.

[5L] CHG CODE	This field allows the entry of a code to change the IDLE and/or PERF factor, displayed in 6L. It is displayed in the PREFLIGHT and DONE phases. The label is displayed in small white font. The brackets, or the entered value, is displayed in large blue font.

[6L] IDLE/PERF	It is only possible to modify these factors when the aircraft is on ground. If no value was entered, the FMS displays default values coded in the Airline Modifiable Information (AMI) file. Default values are displayed in small font, although manually entered values are displayed in large font. When it is necessary to modify the IDLE or the PERF factor: - ENTER the change code in the CHG CODE field [5L]. The default value for this code is "ARM" but it is possible to modify it on airline request (the applicable code is then coded in the Airline Modifiable Information (AMI) file). When a valid change code is entered, the IDLE and PERF factors are displayed in blue. - ENTER the new IDLE and/or PERF factor(s) in the scratchpad. - PRESS the [6L] key to insert the new IDLE and/or PERF factor(s). The new IDLE and/or PERF factor(s) is (are) displayed in large blue font.
[4R] STORED	This field displays pilot-stored data in a large green font. The field is blank, if no data is stored. (The airline can choose to have this data automatically erased at the done phase).
[5R] DELETE ALL	Pressing this key changes the label to amber CONFIRM DELETE ALL. Pressing this key a second time deletes all pilot-stored data, except data that is part of the active and secondary flight plans.
[6R] STATUS/XLOAD	This prompt gives access to the P/N STATUS and P/N XLOAD pages.

P/N XLOAD PAGE

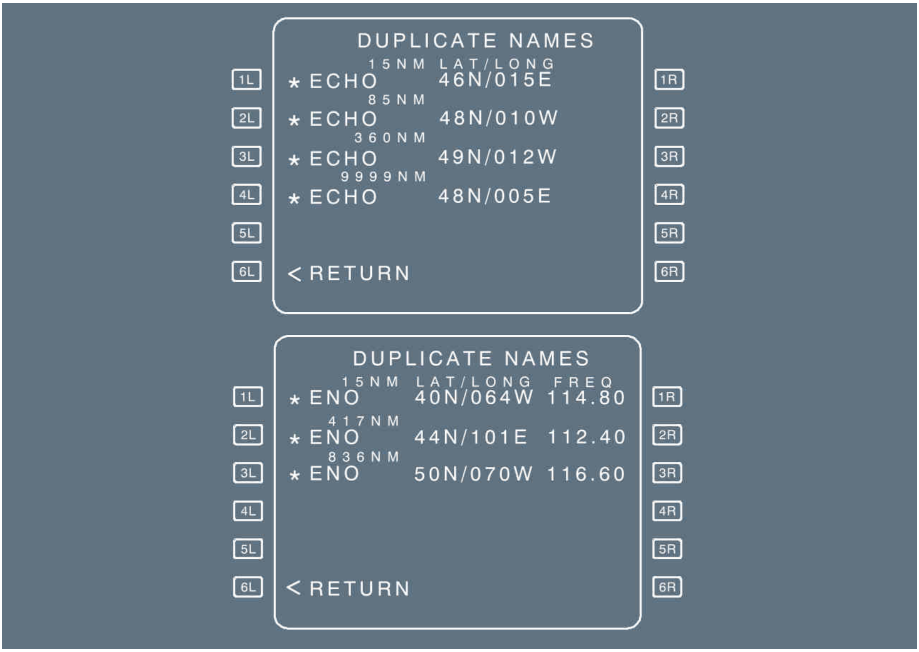
TITLE	P/N STATUS
Line 1 ELEMENT	Indicates the name of the database or configuration file that can be crossloaded: - FMS SOFTWARE on Page 2 - NAV DATA BASE on Page 3 - FM AIRLINE CONFIG on Page 4 - FM OPTIONS CONFIG on Page 5 - PERF DATA BASE on Page 6 - FLIGHT TEST DATABASE on Page 7.
Line 2 FMS1 P/N Line 3 FMS2 P/N	These fields display the part numbers of the database or configuration file (stated on line 1), that are installed on the FMS 1 and 2. Identical part numbers are displayed in green, different ones in amber. During crossload, the updated part number is replaced by the amber “ACCEPTING XLOAD” message.

Line 4	This line is empty when the active flight phase is not Preflight or Done. XLOAD FMx TO FMy or START XLOAD FMx TO FMy: This blue prompt is displayed when the database or configuration file (stated on line 1) can be crossloaded. XLOAD ARMED: Displayed in blue on the receiving FM when the crossload has been requested, but not yet confirmed. XLOAD IN PROCESS: Displayed in white when the crossload is ongoing. XLOAD NOT SUPPORTED: Crossloading is unavailable for this element. NO P/N TO XLOAD: The element is missing. NEED FG 1/FG 2 IDENTICAL TO XLOAD: The receiving side's FG software is incompatible with the FG software to be crossloaded. NEED FM 1/FM 2 SOFTWARE IDENTICAL TO XLOAD: The crossloaded element is incompatible with the receiving side's FM software.
[5L] A/C STATUS	This prompt is available, when no crossload is in process. This gives the pilot access to the aircraft status page. MM: SS MIN REMAINING: Displays the time remaining to complete the crossload, when a crossload is in process.
[6L] PREV PAGE ABORT	This key calls up the previous P/N STATUS page. This amber prompt is displayed when a crossload is in process. The pilot uses it to stop the crossload.
[6R] NEXT PAGE CONFIRM*	This key calls up the next P/N STATUS page. This amber prompt is displayed when a crossload has been armed. The pilot presses it to start the crossload.

DUPLICATE NAMES PAGE

Ident.: DSC-22_20-50-10-25-00000584.0003001 / 01 OCT 12
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

This page, which automatically appears, allows the pilot to select a specific waypoint, airport, or NAVAID when the database holds more than one under the same identifier.



```
         DUPLICATE NAMES
           15NM  LAT/LONG
* ECHO           46N/015E
           85NM
* ECHO           48N/010W
          360NM
* ECHO           49N/012W
         9999NM
* ECHO           48N/005E

< RETURN
```

```
         DUPLICATE NAMES
        15NM  LAT/LONG  FREQ
* ENO         40N/064W  114.80
       417NM
* ENO         44N/101E  112.40
       836NM
* ENO         50N/070W  116.60

< RETURN
```

The pilot presses the key adjacent to a waypoint, NAVAID, or airport to select it as the one to be entered. When the pilot has finished, the page automatically reverts to the previously displayed page.

DISTANCE

The direct distance to the aircraft is displayed in green above each name. If this distance is greater than 9 999 NM, 9 999 NM is displayed.

LAT/LONG COLUMN

This column lists the rounded off latitudes and longitudes of the different points, using the same identifier.

FREQ/CHAN COLUMN

This column lists the NAVAIDs frequencies, if any. It displays CHAN for a GLS.

Note:
- *The DUPLICATE NAMES page is not displayed when 2 waypoints with the same IDENT belong to the same airway. The system selects the first waypoint found in the database.*
- *The waypoints or NAVAIDs are ranked by their distance from the aircraft position.*
- *When a waypoint is named using ICAO phonetic alpha characters, a minus sign and the ICAO code of the country where the waypoint is located, are displayed. e.g. Alpha in France becomes A-LF; Bravo in England becomes B-EG.*

<RETURN
```

The pilot presses the key adjacent to a waypoint, NAVAID, or airport to select it as the one to be entered. When the pilot has finished, the page automatically reverts to the previously displayed page.

DISTANCE

The direct distance to the aircraft is displayed in green above each name. If this distance is greater than 9 999 NM, 9 999 NM is displayed.

LAT/LONG COLUMN

This column lists the rounded off latitudes and longitudes of the different points, using the same identifier.

FREQ/CHAN COLUMN

This column lists the NAVAIDs frequencies, if any. It displays CHAN for a MLS.

Note:
- *The DUPLICATE NAMES page is not displayed when 2 waypoints with the same IDENT belong to the same airway. The system selects the first waypoint found in the database.*
- *The waypoints or NAVAIDs are ranked by their distance from the aircraft position.*
- *When a waypoint is named using ICAO phonetic alpha characters, a minus sign and the ICAO code of the country where the waypoint is located, are displayed. e.g. Alpha in France becomes A-LF; Bravo in England becomes B-EG.*

POSITION MONITOR PAGE

Ident.: DSC-22_20-50-10-25-00000585.0001001 / 17 MAR 11

33 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This page displays all the different positions that the FMGC has computed with the various available methods of navigation. It also shows which method obtained each position. (The positions should be almost identical).

The pilot calls up this page by pressing the 1L key on the data index page.

POSITION MONITOR AND POSITION FROZEN PAGE

Ident.: DSC-22_20-50-10-25-00009133.0001001 / 29 MAR 12

34 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

Line 1 FMGC 1	This line shows the latitude and longitude, as calculated by the FMGC 1, and the navigation method used by the FMGC for that calculation (Example: “3 IRS/DME/DME”).

Line 2 FMGC 2	This line shows the latitude and longitude, as calculated by the FMGC 2, and the navigation method used.
Line 3 RADIO or GPS or GPIRS	This line shows the latitude and longitude, calculated by the onside FMGC from selected radio NAVAIDs (Example: DME/DME, VOR/DME, or LOC) or from GPS or GPIRS.
Line 4 MIX IRS	This line shows the latitude and longitude of the weighted mean inertial reference system (IRS) calculated by the onside FMGC from the available IRSs.
Line 5 IRS 1,2,3	This line shows the deviation in nautical miles of each IRS position from the onside FMGC position. It also displays the IRS mode, which can be INVAL, ALIGN, NAV or ATT. *Note: INVAL is displayed when an ADIRS has failed, or the IRS position is not refreshed.*
[6L] FREEZE/UNFREEZE	The pilot presses this key to freeze (or unfreeze) all the data displayed on the page. When the data is frozen, the title of the page specifies the time at which it was frozen.
[6R] SEL NAVAIDS	The pilot presses this key to access the selected NAVAIDs page.

SELECTED NAVAIDS PAGE

Ident.: DSC-22_20-50-10-25-00000586.0014001 / 03 APR 13

35 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

MODIFIABLE ONLY FOR DESELECTION

Line 1	This field displays the NAVAID tuned for display purposes, and the tuning mode (AUTO, MAN, or RMP).
Line 2 and 3	These fields display the NAVAIDs, if any, tuned for the calculation of radio position by the FMGC.
[4L]	This field displays the tuned ILS, GLS ◁✻ , MLS ◁✻ , if any.
[5L] DESELECT/SELECT RADIONAV	The flight crew presses this key to manually select or deselect the NAVAIDs. If the flight crew selects (deselects) the NAVAIDs for position calculation, “RADIONAV SELECTED” (“RADIONAV DESELECTED”) is displayed in the label line in blue small font and “DESELECT” (“SELECT”) is displayed in white large font. By default NAVAIDs are selected. The deselection of the RADIONAV inhibits use of radio position (either DME/DME or VOR/DME) for position calculation.

[6L] DESELECT/SELECT GPS	The crew presses this key to manually select or deselect the GPS for position computation. Upon transition to the DONE phase, the prompt returns to DESELECT status. If the pilot deselects the GPS, “GPS IS DESELECTED” is displayed when the aircraft is less than 80 NM from the top of descent, or in approach phase.
[1R] DESELECT to [4R]	The pilot deselects a NAVAID by entering its identifier in one of these six fields. Once deselected in this way, the NAVAID can no longer be tuned manually through the entry of its IDENT, nor can it be autotuned for display or determination of the position for the rest of the flight. The deselection is cleared: - Manually, by a CLR action into this field, or - Automatically upon transition to the done or preflight phase, or upon activation of the second database. The pilot may deselect as many as four stations.
[6R] RETURN	The pilot presses this key to return to the POSITION MONITOR page.

IRS MONITOR PAGE

 MERIT    GPS ALT   MODE/SAT
 100M      32000     NAV/6
```

[1L] and [4L]	Display the GPS 1 and 2 positions.
[2L] - [2R] and [5L] - [5R] TTRK-UTC-GS	Display the GPS 1 and 2 true tracks. UTC fields indicate UTC time for each GPS sensor. GS fields indicate the GPS 1 and 2 ground speeds.

[3L] - [3R] and [6L] - [6R] MERIT-GPS ALT-MODE/SAT

Display the GPS 1 and 2 figures of merit (in meters or feet). GPS ALT is displayed for information purposes. It is not used by the FMGS. MODE/SAT fields indicate the GPS 1 and 2 modes followed by the number of satellites tracked.

The GPS can operate in the following modes:

INIT	:	System initialization
ACQ	:	Satellite acquisition
NAV	:	Normal mode
TEST	:	System test
FAULT	:	Invalid system
ALTAID or AIDED	:	Degraded modes. The MMR uses aircraft inputs for computation purposes.
SBAS	:	Satellite Based Augmentation System is being used.

CLOSEST AIRPORTS PAGES

Ident.: DSC-22_20-50-10-25-00000589.0001001 / 17 MAR 11

39 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The system automatically selects the closest 4 airports from the current aircraft position, and displays them on these pages. A fifth one can be selected by the pilot.
Page 1 displays the bearing, distance, and time to go to each airport; page 2 displays the EFOB and allows the crew to enter an effective wind to be flown to each airport.
The flight crew accesses the CLOSEST AIRPORTS page 1 by pressing the 5L key from the DATA INDEX A page. They access the CLOSEST AIRPORTS page 2 by pressing the EFOB/WIND prompt (6R key) on page 1.

```

CLOSEST AIRPORTS 2

[1L] - [1R] to [4L] - [4R] The closest four airports are extracted from the database, and ranked by distance from the aircraft position.

BRG	Displays the current bearing from the aircraft's position to the airport.
DIST	Displays the current great-circle distance from the aircraft's position to the airport.
TIME or UTC	Displays the predicted time to the airport, computed using the current wind or a wind vector entered on page 2, and the speed according to the current mode (managed or selected). The time is only computed in cruise phase.

[5L] The crew may enter a fifth airport here, using the 4-letter code. The entry may be modified at any time, even when “LIST FROZEN” is displayed.

If the pilot enters an airport that is not in the database, then “NOT IN DATABASE” appears in the scratchpad.

[1L] - [1R] EFOB to [5L] - [5R] EFF WIND Displays the EFOB at each airport. EFOB is only computed in cruise phase.

Used to enter an anticipated headwind or tailwind along the bearing to the airport. If the entry is preceded by +, T, or TL, a tailwind is assumed.

If the entry is preceded by -, H, or HD, a headwind is assumed.

Before pilot entry, a default value may be displayed, based on the current wind.

The effective wind is used to compute the EFOB and time to the airport.

[6L] FREEZE/UNFREEZE	This prompt enables the pilot to freeze and unfreeze the list of four airports. The list is automatically frozen when accessing page 2. It will remain frozen upon returning to page 1. The “LIST FROZEN” message is always displayed on page 2.
RETURN	Returns to page 1.
[6R] EFOB/WIND	Gives access to page 2. Pressing this prompt automatically freezes the list of the four closest airports.

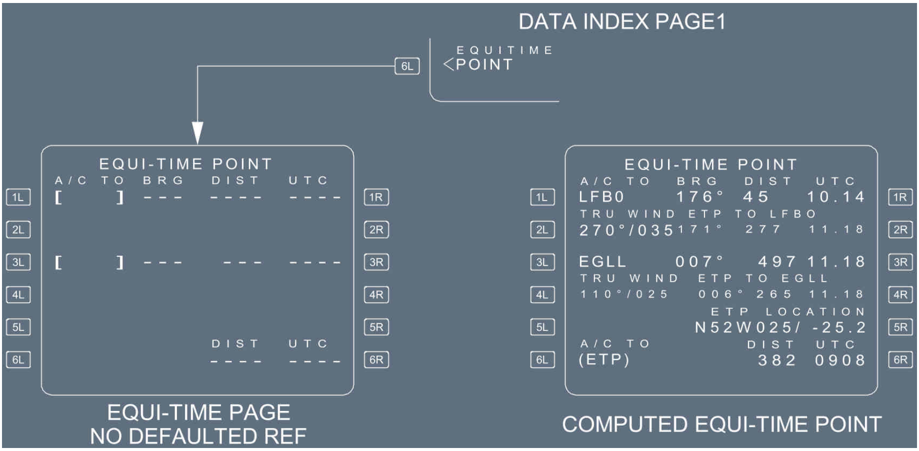
Note:
- *If the aircraft position becomes invalid, all fields are dashed, FREEZE/UNFREEZE and EFOB/WIND prompts are removed, LIST FROZEN is displayed, and the A/C POSITION INVALID message is displayed in the scratchpad. Page 2 cannot be accessed.*
- *Predictions (EFOB, TIME) displayed on the page assume:*
  - *ECON CRZ speed (managed) or current selected speed (selected)*
  - *CI (for managed speed only) and CRZ FL from primary F-PLN are kept*
  - *constant wind value*
  - *In case of engine out, the aircraft altitude is the minimum of (CRZ FL, EO MAX ALT)*
  - *Downpath steps are not considered*
  - *Descent fuel burn is a conservative value which only depends on the difference between current CRZ ALT and destination altitude.*

EQUI-TIME POINT PAGE

Ident.: DSC-22_20-50-10-25-00000590.0001001 / 18 DEC 12

40 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The pilot uses this page to require an equitime point computation between two different points (airport, NAVAID, runway, NDB or waypoint). This pseudo-waypoint (ETP) is displayed on the navigation display along the F-PLN. The EQUI-TIME POINT page is accessed by pressing the 6L key from the DATA INDEX page:



```

COMPUTED EQUI-TIME POINT

[1L] A/C TO and (blue) [3L]	Displays reference waypoint 1. Displays reference waypoint 2.

Note: *Origin and destination airports are used by default for respective reference points 1 and 2, until a pilot entry is made.*

[1R] BRG/DIST/UTC and [3R] (green)	Displays the bearing, distance, time, from the aircraft's current position to the reference waypoint 1. Displays the bearing, distance, time, from the current position of the aircraft to the reference waypoint 2.

BRG :	Displays the current great-circle bearing from the position of the aircraft to the reference waypoint.
DIST :	Displays the current great-circle distance from the position of the aircraft to the reference waypoint.
UTC :	Displays the predicted time of arrival at the reference waypoint (computed using the current wind or a wind vector, entered by the crew). The time is only computed in cruise phase. In other phases, it is dashed.

[2L] and [4L] TRU WIND (blue)	The pilot may enter the wind (direction/velocity) at the reference waypoint and the CRZ FL: This wind is used to compute the time from the aircraft's position to the reference waypoint, and to locate the equitime point. If no entry is made, the wind/velocity field will read zero.

[2R] and [4R] EPT TO XXX (green)	This field displays the bearing distance and the time from the equitime point position (ETP) to the reference waypoint.
[5R] ETP LOCATION	This field displays the ident of the next waypoint following the equitime point. It provides the distance along the flight plan from the equitime point to the indicated waypoint.
[6L] - [6R] A/C TO (ETP) DIST/UTC (green)	This field displays the distance and time from the aircraft's current position to the equitime point along the flight plan. If at least one reference waypoint exists, but no equitime point exists, the field is blank and NO ETP is displayed in 6L.

Note: *The assumptions for the equitime point computation include the cost index, speed managed (with SPD LIM), and winds.*
In case of engine-out, the EO LRC speed is considered.

PRINT FUNCTION PAGES

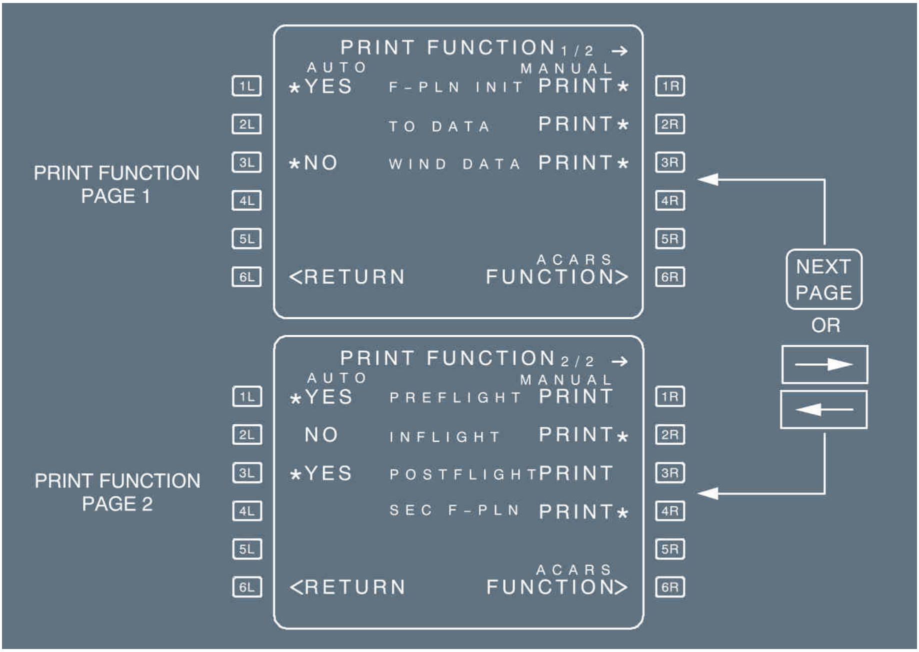
Ident.: DSC-22_20-50-10-25-00000591.0001001 / 01 OCT 12

41 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The PRINT FUNCTION pages enable the crew to print the data relative to the current flight.

This data comes from 2 different sources:
- ACARS uplink messages, and
- Active data from the current flight.

The pilot may access these pages from the “DATA INDEX” page1/2 by pressing the [6R] ACARS/PRINT FUNCTION key.



```
     PRINT FUNCTION1/2  →
  AUTO            MANUAL

      SEC F-PLN   PRINT*

                   ACARS
<RETURN        FUNCTION>
```

PRINT FUNCTION PAGE 1/2

This page displays the status of the automatic printing capabilities, for the uplink messages (left column), and the status of the manual printing capabilities of the current active data (right column).

LEFT COLUMN

AUTO * YES (blue)	Line 1:	Uplink messages related to flight plan INIT data are automatically printed when received.
	Line 2:	Uplink messages related to takeoff data are automatically printed when received.
	Line 3:	Uplink messages related to wind data are automatically printed when received.
* NO (blue)	When "NO", preceded by a star, is displayed in front of a line, automatic printing is deselected. The pilot can reactivate it by pressing the left key of the line.	
NO (without a star)	Automatic printing is internally deactivated for the data of the line. The pilot cannot reactivate it manually.	
Blank	The ACARS function is not available for this line. Uplink messages can neither be received nor automatically printed.	

RIGHT COLUMN

MANUAL	Displays the status of the manual printing capability of the active data (and not of the ACARS uplink data).
PRINT * (amber)	Pressing the right keys prints the following active data: Line 1: Active flight plan INIT data Line 2: Active takeoff data Line 3: Active wind data

If the star is not displayed, printing is not possible.
When the key is pressed, the star is removed until the data is printed.

[6L] RETURN	Pressing this key reverts the display to the DATA INDEX page.
[6R] ACARS FUNCTION	Pressing this key reverts the display to the ACARS FUNCTION page.

PRINT FUNCTION PAGE 2/2

This page describes the printing capabilities of the reports displayed on lines 1 to 4.

LEFT COLUMN

AUTO (white) * YES (blue)	Line 1: The PREFLIGHT report is automatically printed at engine start. Line 2: The INFLIGHT report is automatically printed at takeoff. Line 3: The POSTFLIGHT report is automatically printed at engine shutdown.
* NO (blue)	The report, displayed on the line, is not printed automatically. The pilot can reactivate the function by pressing the left key of the line.
NO (without a star)	Automatic printing is internally deactivated for the report. The pilot cannot reactivate it.

RIGHT COLUMN

MANUAL PRINT *	Pressing a right key prints the report displayed on the line. If the star is not displayed, printing is not possible. When the key is pressed, the star is removed until the report is printed. For the PREFLIGHT, INFLIGHT and POSTFLIGHT reports, only one type of report is available for printing at any given time, depending on the current flight phase. For the SEC F-PLN report, the print selection start is only displayed if a secondary flight plan exists.

ACARS FUNCTION PAGE

Ident.: DSC-22_20-50-10-25-00000592.0001001 / 01 OCT 12

The ACARS FUNCTION pages display the functions enabling the crew to send manual requests or reports to the ground.

All functions, displayed on pages 1 and 2, may be inhibited through a pin program.
The ACARS/PRINT FUNCTION prompt is displayed on the DATA INDEX page 1/2. Pressing this key displays the PRINT FUNCTION page from which the ACARS FUNCTION page can be accessed.

TITLE	ACARS FUNCTION 1/2 in white
Line 1 F-PLN INIT REQ*	Pressing this key sends a request for flight plan to the ground (downlink message) The INIT REQUEST prompt of the INIT A page provides the same function.
Line 2 TO DATA REQ*	Pressing this key sends a request for takeoff data. Displayed in the DONE and PREFLIGHT phases. The TO DATA REQUEST prompt of the UPLINK TO DATA REQ page provides the same function.
Line 3 WIND DATA REQ*	Pressing this key sends a request for wind data. The WIND REQUEST prompt of the CLIMB, CRUISE, and DESCENT WIND pages provides the same function.

Note: *If “REQ” is not followed by a star, the request cannot be sent (downlink message).*
When a function (line 1 or 2 or 3) is deactivated internally, the corresponding line is blank.

[6L] RETURN	The pilot presses this key to make the display revert to the DATA INDEX page.
[6R] PRINT FUNCTION	The pilot presses this key to access the PRINT FUNCTION page.

UPLINK TO DATA REQ PAGES

Ident.: DSC-22_20-50-10-25-00000594.0009001 / 14 MAY 12

This page allows the flight crew to send a request for takeoff data for up to 2 runways. There is one page for each runway. The page is accessed from the PERF TAKEOFF page, or from the UPLINK XXX (MAX or DRT or FLX) TO DATA page, by pressing the UPLINK TO DATA prompt.

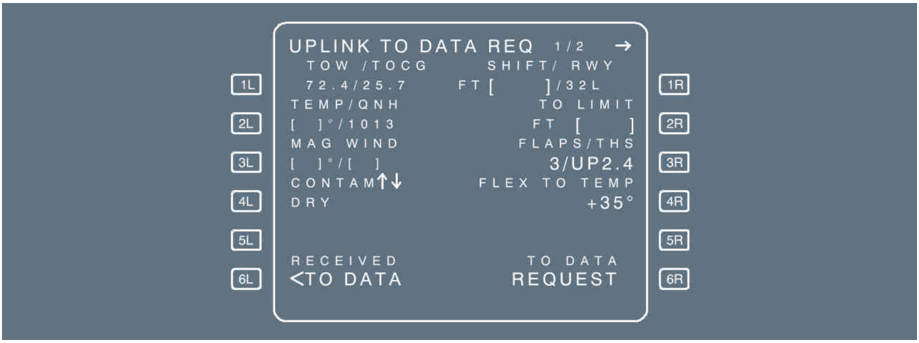
TITLE	White.
[1L] TOW/TOCG (green)	This field is dashed, until a runway is defined in the [1R] field. The TOW/TOCG is defaulted to the values of the INIT B and FUEL PRED pages. If not available, dashes are displayed. It cannot be modified by the pilot.
[2L] TEMP/QNH or QFE (green/blue)	This field is dashed, until a runway is defined in the [1R] field. It displays the temperature at origin and baro setting. TEMP = If the temperature is not defined, blue brackets are displayed, and the flight crew can modify this field according to the weather information. BARO = Defaulted to FCU selection and can be modified by the pilot.
[3L] MAG WIND (blue)	This field is dashed, until a runway is defined in the [1R] field. It displays the wind at the origin. If the wind is not defined, blue brackets are displayed. The pilot can modify this field.

[4L] CONTAM (blue)	This field is dashed, until a runway is defined in the [1R] field. The display is defaulted to DRY. The scroll keys allow the crew to modify the runway contamination. DRY, WET, 1/4 WATER, 1/2 WATER, 1/4 SLUSH, 1/2 SLUSH, COMP SNOW.
[6L] RECEIVED TO DATA	This field calls up the UPLINK MAX (or FLX or DRT) TO DATA page that displays the data received by AOC.



```

<TO DATA               REQUEST
```

[1R] SHIFT/RWY (blue)	This field is dashed, until a runway is defined in the F-PLN. If a runway is defined in the F-PLN, it is automatically filled in as: SHIFT = Value from the PERF TO page, or blue brackets [ ], if no value is defined. RWY = F-PLN departure runway. The pilot can modify this field.
[2R] TO LIMIT (blue)	It is dashed, until a runway is defined in the [1R] field. It displays blue brackets [ ], when a runway is defined. The pilot may enter a length, considering runway obstacles.
[3R] FLAPS/THS (blue)	This field is dashed, until a runway is defined in the [1R] field; it is then defaulted to values from the PERF TO page. Blue brackets are displayed, if the PERF TO page does not have any defined values.
[4R] FLEX TO TEMP (blue)	This field is dashed, until a runway is defined in the [1R] field; it is then defaulted to values from the PERF TO page. Blue brackets are displayed, if the PERF TO page does not have any defined values. The pilot can modify this field and enter a FLEX TO temperature (FXX).
[6R] TO DATA REQUEST* (amber)	Pressing the key sends the takeoff data request message to the ground. The asterisk disappears when the request is sent. It reappears when the data is available.

Page 2/2 is a page used for requesting a second runway data.

Note: *If the UPLINK TO DATA REQ Page 2 is accessed (Page 1 being filled), the fields of this page are filled with default values after entry of a runway in [1R]. QNH or QFE and wind are common with Page 1.*

```

This page is accessed from the UPLINK TO DATA REQ page by pressing the RECEIVED TO DATA key.
There is a set of 2 pages (MAX TO DATA and FLEX TO DATA) for each of the 4 uplinked runway data. Uplinked data is displayed in green. (It cannot be modified by the flight crew).

[1L] TOW/TOCG	Uplinked reference Takeoff Gross Weight and Takeoff Center of Gravity.
[2L] TEMP/QNH (or QFE)	Uplinked assumed temperature and BARO setting.
[3L] MAG WIND	Uplinked takeoff runway wind.

[4L] CONTAM	Uplinked takeoff runway contamination.
[5L] THR RED/ACC	Uplinked Thrust Reduction and Acceleration altitudes.
[6L] UPLINK TO DATA	Pressing the key calls up the UPLINK TO DATA REQ page.
V1, VR, V2	Uplinked takeoff speeds.
[1R] SHIFT/RWY	Uplinked TO runway IDENT, runway intersection and position shift.
[2R] TO LIMIT	Uplinked runway length remaining.
[3R] FLAPS/THS	Uplinked FLAPS/SLATS CONF and TRIM position.
[4R] FLEX TO	Pressing this key calls up the UPLINK FLEX TO DATA pages.
[5R] ENG OUT ACC	Uplinked engine-out acceleration altitude.
[6R] INSERT UPLINK*	Uplinked takeoff data is available for insertion. Selecting this prompt inserts the following data on the PERF TO page: - V1, VR, V2 - THR RED/ACC, ENG OUT ACC altitudes - FLAPS/THS - SHIFT - FLEX The display reverts to the PERF TO page, the asterisk disappears. This field is not displayed, if the runway does not match the active runway. If the runway matches the active runway but the uplinked TOW differs from the current TOW (the uplinked TOW is 3 t greater or 1 t lower than the TOW estimated by the FMS): - The asterisk disappears and the insertion is not possible - The TOW value is displayed in amber in [1L] field.

Note: *All previously-received data is replaced by the new uplinked data.*

```

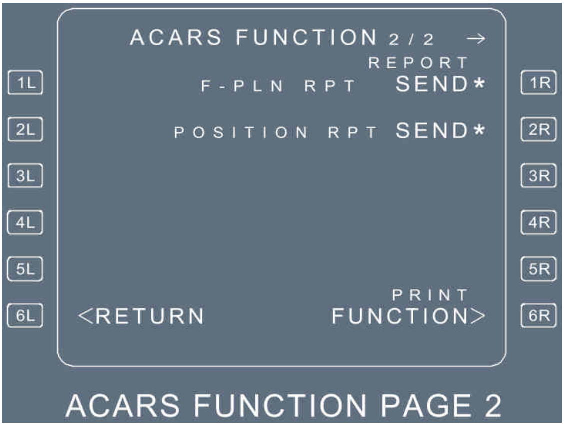
TITLE	UPLINK FLX TO DATA.
[2L]	FLX/QNH (or QFE) When the UPLINK FLEX TO DATA page is selected, it displays uplink assumed Flex Temperature and BARO setting (QNH or QFE).
[4R] MAX TO	Pressing this key calls up the MAX TO DATA page.

ACARS FUNCTION PAGE 2

Ident.: DSC-22_20-50-10-25-00000597.0001001 / 17 MAR 11

47 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**



Line 1 F-PLN RPT SEND	Pressing this key sends the flight plan report to the ground.
Line 2 POSITION RPT SEND	Pressing this key sends a Position Report to the ground.

Note:
- *No report can be sent, if “SEND” is not followed by a star*
- *When a function (line 1 or 2) is deactivated through the navigation database policy file, the corresponding line is blank.*

[6L] RETURN	The pilot presses this key to revert to the DATA INDEX page.
[6R] PRINT FUNCTION	The pilot presses this key to access the PRINT FUNCTION page.

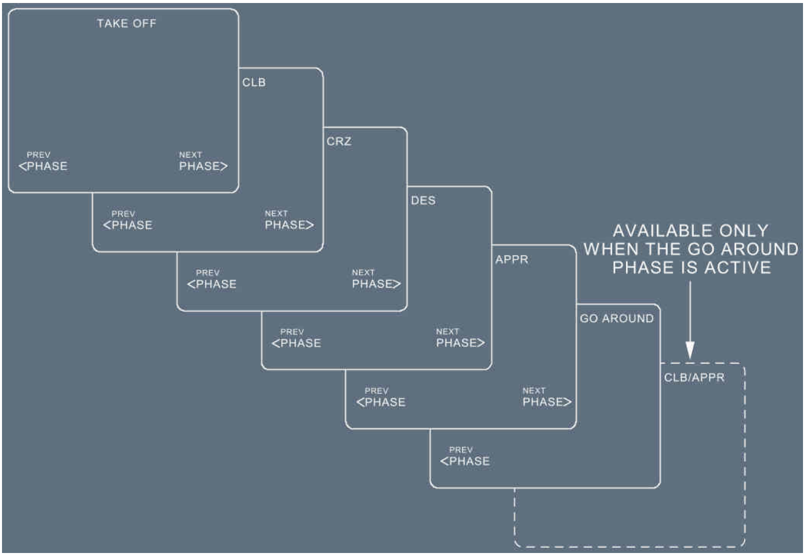
PERF PAGE

Ident.: DSC-22_20-50-10-25-00000598.0001001 / 17 MAR 11

48 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The flight plan is divided into the following phases:
PREFLIGHT, TAKEOFF, CLIMB, CRUISE, DESCENT, APPROACH, GO-AROUND, DONE.
Each phase, except for the preflight and done phases, has a performance (PERF) page. The PERF pages display performance data, speeds related to the various phases, and predictions.

Pressing the PERF key on the MCDU console calls up the performance page for the current active phase. Performance pages, relating to phases already flown, are not available.
In the preflight and done phases, pressing the PERF key brings up the takeoff performance page.
Pressing the PERF key in the done phase makes the phase transition to the preflight phase.



TAKE OFF
PREV <PHASE
NEXT PHASE>

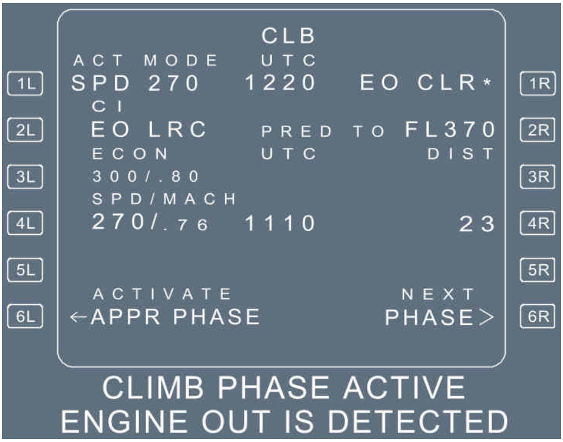
PREV <PHASE
NEXT PHASE>
CRZ
PREV <PHASE
NEXT PHASE>
DES
PREV <PHASE
NEXT PHASE>
APPR
PREV <PHASE
NEXT PHASE>
GO AROUND
PREV <PHASE
CLB/APPR
AVAILABLE ONLY WHEN THE GO AROUND PHASE IS ACTIVE

The FMGS flight phases are not related to the FWC flight phases.

Line 6	Fields may display two different prompts, depending upon whether the phase is active or not.
[6L] PREV PHASE	To review the performance page for the previous phase. The prompt is unavailable on the takeoff performance page. It is also unavailable for phases already flown.
[6L] ACTIVATE APPR PHASE	To activate, then confirm, the APPR phase. Available only on the page corresponding to the active phase.
[6R] NEXT PHASE	To review the performance page for the next phase.

Note: ***Engine-out condition***

- *When the FMGS detects an engine-out condition, the system automatically calls up the performance page for the current flight phase (except when this occurs before the diversion point during takeoff or no EOSID exists in the flight plan) and displays "EO CLR*" in the [1R] field and EO LRC (engine-out long range cruise) in the [2L] field. On the CLB, CRZ and DES (when the descent phase is not active) PERF pages, the pilot can enter a cost index value and overwrite to "EO LRC". Clearing the cost index reverts to EO LRC.*
  If the pilot presses the [1R] key, the system reverts to the normal processing (with no engine failed) and suppresses the EO information. (Refer to DSC-22_20-30-10-15 General).
- *If the engine-out condition is detected before the diversion point at takeoff, a temporary flight plan is created.*



```

Flaps/Slats retraction speeds and green dot speeds, provided by the FMGC once aircraft GW has been computed

TITLE	TAKE OFF RWY is in large green font when the takeoff phase is active, and in large white font when it is inactive. The active flight plan selected runway is displayed in large green font.

<u>Note:</u> *If the takeoff shift, or the flaps/THS, or the runway is changed after V1, VR or V2 insertion, but the origin airport remains the same, the MCDU “CHECK TAKE OFF DATA” message appears. All takeoff parameters are retained except in case of runway change. In case of runway change, the parameters are invalidated, but still displayed adjacent to each field. The “CONFIRM TO DATA” prompt in [6R] allows reverting to the previous values.*

[1L] V1 [2L] VR [3L] V2	The boxes remain amber, as long as the pilot does not make entries in them. The pilot can modify any entry, as long as the takeoff phase is not active. *Note:* *1. If the flight crew does not enter V2, the SRS mode will be unavailable at takeoff.* *2. The MCDU “V1/VR/V2 DISAGREE” amber message appears if the inserted V1, VR, V2 speeds do not satisfy the condition: V1 ≤ VR ≤ V2.* *3. The MCDU “TO SPEED TOO LOW” amber message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.*
[4L] TRANS ALT (transion altitude)	This field displays the navigation database default altitude (if defined) once the origin airport is entered. The pilot can modify it.
[5L] THR RED (thrust reduction altitude)	This is the altitude at which the pilot should reduce the thrust from TOGA/FLX to MAX CLIMB (CL detent) with all engines operative (“CLB” or “LVR CLB” flashing on the FMA). - The thrust reduction altitude defaults to 1 500 ft above the runway elevation, or to the altitude set by the airline - The pilot can modify this altitude: The minimum is 400 ft above the runway elevation.
ACC (Acceleration altitude)	This is the altitude at which the climb phase is triggered. - The target speed jumps to the initial climb speed - The default value is 1 500 ft above runway elevation - The flight crew can modify the value. The minimum value is 400 ft above runway elevation, and it can be higher than, or equal to, or lower than THR RED. *Note:* *- A clearing action reverts both values to the defaulted ones* *- When the flight crew selects an altitude on the FCU that is below THR RED, it brings THR RED and ACC down to this altitude. (The 400 ft minimum still applies).*
[6L] UPLINK TO DATA	This key calls up the UPLINK TO DATA REQ page. It is only displayed in the preflight and done phases.
[1R] EO CLR	EO CLR is displayed when an engine-out is detected and when active flight phase is takeoff.

[2R] TO SHIFT	The takeoff shift is the distance in meters or feet between the beginning of the runway and the aircraft's takeoff position. When taking off from an intersection, the flight crew should insert this value to ensure a correct update of the FM position. The takeoff shift value must be positive, and cannot be greater than the runway length.
[3R] FLAPS/THS	This is a flight crew entry for the positions of the flaps and the trimmable horizontal stabilizer (THS) at takeoff. The flight crew can modify it until takeoff, by entering “UP X.X” or “X.X UP”, or “DN X.X” or “X.X DN” for the THS.
[4R] FLX TO TEMP	The flight crew inserts the FLX TO temperature for FLX takeoff setting purposes. The flight crew can only enter it during preflight. The system sends it to the FADEC and displays the entered data on the upper ECAM display. The TEMP value is always entered in degrees Celsius.
[5R] ENG OUT ACC	This field displays the engine-out acceleration altitude, as defined in the database, or is manually entered by the flight crew. This is for display only, as a reminder. It cannot be cleared. The above ACC altitude rules of [5L] apply to this field.
[6R] NEXT PAGE or CONFIRM TO DATA*	This key calls up the climb performance page, or allows the flight crew to revert to the previously-entered T.O. parameters, in case of runway change with the same origin airport.

TITLE	CLB is displayed in large white fonts when the climb phase is inactive, and in large green fonts if it is active.
[1L] ACT MODE	This field displays the preselected or active speed mode: SELECTED or MANAGED. The pilot cannot modify it from this field.
[2L] CI (Cost Index)	This field displays the cost index, as initialized on the INIT A or defaulted from the database, or inserted in this field by the pilot. EO LRC automatically replaces the cost index value in case of engine-out.
[3L] MANAGED	This field displays the FMGS computed ECON speed/Mach (*Refer to DSC-22_20-40-10 Optimization*). Before CLIMB phase is active, if the preselected speed mode is SELECTED, a star is displayed next to the MANAGED speed. Pressing the 3L key in this case preselects MANAGED speed, and 4L reverts to brackets.

[4L] PRESEL or SELECTED	If the climb phase is not active: This field displays PRESEL as long as the climb phase is not active. The pilot can enter a preselected speed only. If the climb phase is active: The title of this field becomes SELECTED. This field displays the selected (or preselected) SPD or MACH target. The pilot cannot modify it directly in this field, but can adjust it with the SPD/MACH selection knob on the FCU. If the pilot pushes in the FCU SPD/MACH selection knob to revert to managed speed, the system selects (or reselects) ECON SPD/MACH and [4L] is blank.
[5L] Blank or EXPEDITE	This field is blank as long as the aircraft is in preflight. This field displays this legend when the takeoff or climb phase is active. The flight crew cannot engage EXPEDITE from this field. It indicates the time and distance required to reach the altitude displayed in the 2R field, in case of climb at green dot.
[6L] PREV PHASE	This field displays this legend if climb phase is not active. The pilot presses this key to call up the takeoff page.
[6L] ACTIVATE APPR PHASE	The field displays this legend if the climb phase is active. Pressing this key once displays “CONFIRM APPR PHASE*”. Pressing it again activates the approach phase.
[1R] EO CLR	The system displays the EO CLR prompt in case of engine out in climb.
[2R] PRED TO...	This field displays the target altitude for the predictions shown in 3R, 4R, or 5L. It defaults to FCU altitude, but the pilot can modify it to any altitude below CRZ FL.
[3R] [4R] [5R]	These fields show time and distance predictions for the target altitude selected in [2R], computed for the current vertical mode and speed mode (MANAGED, SELECTED). These fields are displayed only while the takeoff, or climb phase is active.
[6R] NEXT PHASE	The flight crew presses this key to call up the PERF CRZ page.

TITLE	CRZ in white large font, when cruise phase is not active, in green large font, when it is.
[1L] ACT MODE	This field shows the preselected or active speed mode: SELECTED or MANAGED. The pilot cannot modify it through this field.
[2L] CI	This field shows the cost index as initialized on the INIT A page or defaulted from the database, or as inserted in this field by the crew. EO LRC replaces automatically the cost index value in case of engine out.
[3L] MANAGED	This field displays the FMGS computed ECON speed/Mach (*Refer to DSC-22_20-40-10 Optimization*). Before CRUISE phase is active, if the preselected speed mode is SELECTED, a star is displayed next to the MANAGED speed. Pressing the 3L key in this case preselects MANAGED speed, and 4L reverts to brackets.

[4L] PRESEL	If cruise phase is not active: The pilot can enter a preselected speed or Mach number. If cruise phase is active: This field is blank. *Note: If the flight crew enters a value in the PRESEL field during the cruise altitude capture (ALT CRZ*), the FCU selected speed may revert to M 0.01.*
[6L] PREV PHASE or	The pilot can press this key to call up the climb page, if the cruise phase is not yet active.
[6L] ACTIVATE APPR PHASE	This field displays this legend if the cruise phase is active. The flight crew presses the key once to change the legend to “CONFIRM APPR PHASE*”. A second press activates the approach phase. *Note: If the pilot activates the approach phase inadvertently, it can reselect the cruise flight level into the progress page to reactivate the cruise phase.*
[1R] TIME/UTC DES EFOB	Before takeoff this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field displays automatically the predicted arrival time (UTC) at destination. After takeoff it displays the predicted arrival time at destination (UTC) and the remaining fuel on board (DEST EFOB) at destination, in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] STEP TO FL XX, DRIFT DOWN TO FL XX, or TO T/D	The field, in combination with 3R, displays the predictions for the step point and the step altitude, the drift down altitude, or the Top of Descent.
[3R] TIME/UTC and DIST	This field displays the time and distance to go to the various points identified in 2R.
[4R] DES CABIN RATE	This field displays MAX [computed DES cabin rate, maximum descent cabin rate]. The pilot may modify the value: the FM recomputes then the top of descent in order to match this value. If the FM cannot match the pilot entry, the FM computed value overwrites the pilot entry. A clear action reverts to the default value (-350 ft/min). DES CAB RATE being a negative value, 'minus” is not a necessary entry.
[5R] STEP ALTS	This key calls up the STEP ALTS page (vertical revision *Refer to DSC-22_20-50-10-25 VERTICAL REVISION Pages*).

[6R] NEXT PHASE	This key calls up the DES page.

TITLE	DES is in large white font if the descent phase is not active; it is in large green font, if it is.
[1L] ACT MODE	This field displays the preselected or active speed mode (MANAGED or SELECTED). The flight crew cannot modify it through this field.
[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. The flight crew cannot modify it when the descent phase is active.

[3L] MANAGED	If the descent phase is not active: Before the flight crew makes any entry. This field displays MANAGED in white, with the associated ECON descent Mach or speed in blue. The crew may overwrite the ECON descent Mach or speed by entering a Mach number or a speed in this field. The system uses the pilot entry to compute the descent profile. The descent may be flown in managed using this new pilot entry. The entry is modifiable. It can be cleared to revert to ECON speed/Mach. If the descent phase is active: The flight crew cannot make an entry in this field. The field displays the ECON speed/Mach or the speed/Mach value previously entered by the pilot.
[4L] blank or SELECTED	If the descent phase is not active, or the descent phase is active but the active speed mode is MANAGED: This field is blank. If the descent phase is active and the active speed mode is SELECTED: The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. To modify the field value, the pilot will use the SPD/MACH selector knob of the FCU. [4L] field and FCU window will display the same value. Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or EXPEDITE	If the descent phase is not active this field is blank. Displays this legend if the descent phase is active. It indicates the time and distance required to reach the altitude displayed in the 2R field at MMO/VMO speed. The pilot cannot select the EXPEDITE mode through this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page if the descent phase is not yet active. Displayed if the descent phase is active. First press causes “CONFIRM APPR PHASE” to be displayed. Second press activates the approach phase.

[1R] TIME/UTC DEST EFOB	Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field displays automatically the predicted arrival time (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board (DEST EFOB) at destination in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] PRED TO...	This field displays the target altitude for the predictions in [3R] [4R], or [5R]. The display defaults to the altitude selected on the FCU. The flight crew can modify it to any altitude lower than present altitude.
[3R] [4R] [5R]	These fields display time and distance predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated speed mode (MANAGED, SELECTED).
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

TITLE	DES is in large white font if the descent phase is not active; it is in large green font, if it is.
[1L] ACT MODE	This field displays the preselected or active speed mode (MANAGED or SELECTED). The flight crew cannot modify it through this field.
[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. The flight crew cannot modify it when the descent phase is active.

[3L] MANAGED	Before the flight crew makes any entry, this field displays MANAGED in white, with the associated ECON descent Mach or speed in blue. The flight crew may overwrite the ECON descent Mach or speed by entering a Mach number or a speed in this field. The system uses the flight crew entry to compute the descent profile. It is possible to fly the descent in the MANAGED mode, with the use of this new flight crew entry. The flight crew can modify this field either before or after the beginning of the descent, with the application of one of the following: - Enter only a new speed and keep the same managed Mach number (entry format: /XXX), or - Enter a new target speed and enable the FMS to compute a new managed Mach number with the highest possible cross-over altitude (entry format: XXX), or - Clear the entry to revert to ECON Mach/speed.
[4L] blank or SELECTED	If the descent phase is not active, or the descent phase is active but the active speed mode is MANAGED: This field is blank. If the descent phase is active and the active speed mode is SELECTED: The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. To modify the field value, the pilot will use the SPD/MACH selector knob of the FCU. [4L] field and FCU window will display the same value. Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or EXPEDITE	If the descent phase is not active this field is blank. Displays this legend if the descent phase is active. It indicates the time and distance required to reach the altitude displayed in the 2R field at MMO/VMO speed. The pilot cannot select the EXPEDITE mode through this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page if the descent phase is not yet active. Displayed if the descent phase is active. First press causes “CONFIRM APPR PHASE” to be displayed. Second press activates the approach phase.

[1R] TIME/UTC DEST EFOB	Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field displays automatically the predicted arrival time (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board (DEST EFOB) at destination in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] PRED TO...	This field displays the target altitude for the predictions in [3R] [4R], or [5R]. The display defaults to the altitude selected on the FCU. The flight crew can modify it to any altitude lower than present altitude.
[3R] [4R] [5R]	These fields display time and distance predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated speed mode (MANAGED, SELECTED).
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

```

F, S, GREEN DOT and VLS speeds computed by the FG assuming the landing weight.

NOTE: VLS is the VLS of the selected LDG CONF (3 or FULL)

TITLE	The page title displays: - APPR, if the Approach phase is not active or APPR, if the Approach phase is active, and - The identification of the selected approach.

[1L] QNH	This field displays brackets, when the aircraft is more than 180 NM from the destination. Inside 180 NM, mandatory amber boxes appear. The flight crew must enter the QNH in hectopascals (hPa) or in inches of mercury (inHg). The value is either entered in hPa or inHg: - For hPa, enter three or four digits, within the allowable range for hPa, or - For inHg, enter the four digits of the desired value with or without a decimal point, within the allowable range for inHg. The system interprets: - 1003 as 1 003 hPa - 2900 as 29.00 inHg - 29.92 as 29.92 inHg. The flight crew can modify this entry at any time. *Note:* *An erroneous entry of an OAT or BARO minimum in QNH field (e.g. 22 °C or 2 200 ft) is accepted by the system. As a consequence, the CPC computes an erroneous cabin pressurization segment during descent, then may trigger a pressurization ECAM alert.*
[2L] TEMP	This field displays the temperature at destination. Until the flight crew enters the temperature, the field displays brackets. The flight crew can modify this figure. The system uses this temperature to refine its computation of the descent profile (ISA model).
[3L] MAG WIND or TRUE WIND	The flight crew enters the wind speed in knots at the destination in this field. The reference of the wind entry is magnetic or true, depending on the airport's reference. The system transmits any entry made in this field to the DESCENT WIND page (which displays wind direction as true, not magnetic, whatever the airport's reference is).
[4L] TRANS ALT	This field displays the transition altitude taken from the database (small font) or entered by the flight crew (large font). The flight crew can modify it at any time.

[5L] VAPP	The FMGC computes this approach speed, using the formula: VAPP = VLS + 1/3 of the headwind components (limited to VLS +5 kt as a minimum and VLS +15 kt as a maximum). The flight crew can modify VAPP. A clear action reverts VAPP to the computed value. *Note:* *VLS = 1.23 VS1G of the selected landing configuration (FULL or 3).*
[6L] PREV PAGE	This field displays this legend if the approach phase is not active. Pressing this key calls up the PERF DES page.
[1R] FLS/FINAL APP * ◁	This field is displayed only with the FLS/FINAL APP - Coexistence ◁ . This field enables the flight crew to select FLS or FINAL APP as a guidance mode for the non precision approach selected in the ARRIVAL page. The selected guidance mode is displayed in cyan large font. The other guidance mode is displayed in white small font. If the key is pressed, the CONFIRM FINAL APP or CONFIRM FLS prompt appears. The flight crew must press the key to confirm the choice. *Note:* *1. FLS is the default mode for non precision approach.* *2. In the case of an RNAV(RNP) approach, or if FLS guidance is not available for the selected approach FINAL APP will be automatically selected. In this case, FINAL APP will be displayed and the key is inhibited.*
[2R] BARO	This field displays: - The MDA with associated brackets, or - The MDH with associated brackets, if the aircraft is equipped with QFE ◁ option. The flight crew inserts the value, which can be modified at any time. If the flight crew makes an entry in [3R] field or changes the approach, it clears this figure. The BARO range is 0 to 5 000 ft above landing elevation.
[3R] RADIO	If the flight plan includes an ILS, GLS ◁ or MLS ◁ approach, this field displays RADIO and empty brackets. For a CAT II or CAT III approach, the flight crew inserts the decision height. The system will accept an entry of NO, NODH or NO DH. If the flight crew inserts a BARO value in [2R] field, this erases the decision height, and this field reverts to brackets. The RADIO range is 0 to 700 ft.

[4R] Blank or EO CLR	When the flight phase is Approach and an engine-out is active, the EO CLR prompt appears. The flight crew can deactivate the engine out mode by pressing the key.
[5R] LDG CONF FULL/CONF 3	The flight crew can use this key to select the landing configuration. CONF FULL is the default landing configuration. The selected configuration is displayed in first position. The configuration that is not selected is displayed in second position.
[6R] NEXT PHASE	Pressing this key calls up the PERF GO AROUND page.

TITLE	The page title displays APPR, if the Approach phase is not active or APPR, if it the Approach phase is active.

[1L] QNH	This field displays brackets, when the aircraft is more than 180 NM from the destination. Inside 180 NM, mandatory amber boxes appear. The flight crew must enter the QNH in hectopascals (hPa) or in inches of mercury (inHg). The value is either entered in hPa or inHg: - For hPa, enter three or four digits within the allowable range for hPa, or - For inHg, enter the two digits of the desired value or two digits followed by a decimal point and two additional digits, within the allowable range for inHg. The system interprets: - 1 003 as 1 003 hPa - 29 as 29.00 inHg - 29.92 as 29.92 inHg. The flight crew can modify this entry at any time. *Note:* *An erroneous entry of an OAT or BARO minimum in QNH field (e.g. 22 °C or 2 200 ft) is accepted by the system. As a consequence, the CPC computes an erroneous cabin pressurization segment during descent, then may trigger a pressurization ECAM alert.*
[2L] TEMP	This field displays the temperature at destination. Until the flight crew enters the temperature, the field displays brackets. The flight crew can modify this figure. The system uses this temperature to refine its computation of the descent profile (ISA model).
[3L] MAG WIND	The flight crew enters the magnetic wind in knots at the destination in this field. The system transmits any entry made in this field to the VERTICAL REVISION and FLIGHT PLAN B pages (which display wind direction as true, not magnetic).
[4L] TRANS ALT	This field displays the transition altitude taken from the database (small font) or entered by the flight crew (large font). The flight crew can modify it at any time.

[5L] VAPP	The FMGC computes this approach speed, using the formula: VAPP = VLS + 1/3 of the headwind components (limited to VLS +5 kt as a minimum and VLS +15 kt as a maximum). The flight crew can modify VAPP. A clear action reverts VAPP to the computed value. *Note:* *VLS = 1.23 VS1G of the selected landing configuration (FULL or 3).*
[6L] PREV PAGE	This field displays this legend if the approach phase is not active. Pressing this key calls up the PERF DES page.
[1R] FINAL	This field displays the approach specified in the flight plan. The flight crew cannot modify it through this field.

[2R] MDA/MDH or BARO ◁	This field displays:
	- The MDA with associated brackets, or
	- The MDH with associated brackets, if:
	  - The aircraft is equipped with QFE ◁ option, or
	  - The FCU setting is QFE, if the aircraft is equipped with the BARO ◁ option.
	The flight crew inserts the value, which can be modified at any time. If the flight crew makes an entry in [3R] field or changes the approach, it clears this figure.

[3R] DH or RADIO ◁	If the flight plan includes an ILS, GLS ◁ or MLS ◁ approach, this field displays DH or RADIO ◁ and empty brackets. For a CAT II or CAT III approach, the flight crew inserts the decision height. The system will accept an entry of NO, NODH or NO DH. If the flight crew inserts an MDA or an MDH (or a BARO ◁ value) in [2R] field, this erases the decision height, and this field reverts to brackets. The DH or RADIO ◁ range is 0 to 700 ft.
[4R] LDG CONF CONF 3	The flight crew can select CONF 3 by pressing this key. This moves the * down to the [5R] field, that displays FULL.
[5R] FULL	The flight crew can use this key to select CONF FULL when necessary. CONF FULL is the default landing configuration.
[6R] NEXT PHASE	Pressing this key calls up the PERF GO AROUND page.

PERF GO AROUND PAGE

←APPR PHASE PHASE>

TITLE	GO AROUND is in large white font, if the go-around phase is not active; it is in large green font, if it is.

[5L] THR RED ACC	This field displays the thrust reduction altitude and the acceleration altitude. **Thrust reduction altitude:** - Altitude at which thrust must be reduced from takeoff/go-around thrust to maximum climb thrust - “CLB” or “LVR CLB” flashing on flight mode annunciator - Defaults to 1 500 ft above destination runway elevation, or to the altitude set by the airline - Can be modified by the crew (minimum 400 ft above destination runway elevation). **Acceleration altitude:** - Altitude at which target speed jumps to green-dot speed (see the note below) - Defaults to 1 500 ft above destination runway elevation, or to the altitude set by the airline. - Can be modified by the crew, but is always equal to (or higher than) the thrust reduction altitude.
[6L] PREV PHASE or	This field displays this legend if the go-around phase is not active. Pressing the key calls up the PERF APPR page.
ACTIVATE APPR PHASE	This field displays this legend if the go-around phase is active. Pressing it once makes “CONFIRM APPR” appear. A second press activates the approach phase.
[5R] ENG OUT ACC	This display has the same characteristics as the display beside the 5R key on the takeoff page. It is for display only, and the pilot can modify it.
[6R] NEXT PHASE	Pressing this key calls up the PERF APPR page.
[IR] Blank or EO CLR*	This field is normally blank. EO CLR* is displayed when GO AROUND is the active phase and an engine-out condition is detected.

Note: *When the go-around phase is active, if the pilot enables ALTN or if the pilot inserts a new destination in the active flight plan and a new cruise flight level on the progress page, the go-around phase shifts automatically into the climb phase. (The target speed jumps from green dot speed to initial climb speed).*

PROG PAGES

Ident.: DSC-22_20-50-10-25-00000605.0046001 / 10 MAY 22
Applicable to: MSN 01143-01376

The progress page is a multifunction page that enables the pilot to:
- Select a new cruise flight level
- Crosscheck the navigation accuracy of the Flight Management (FM) system and validate it
- Update the FM position
- Monitor the descent.

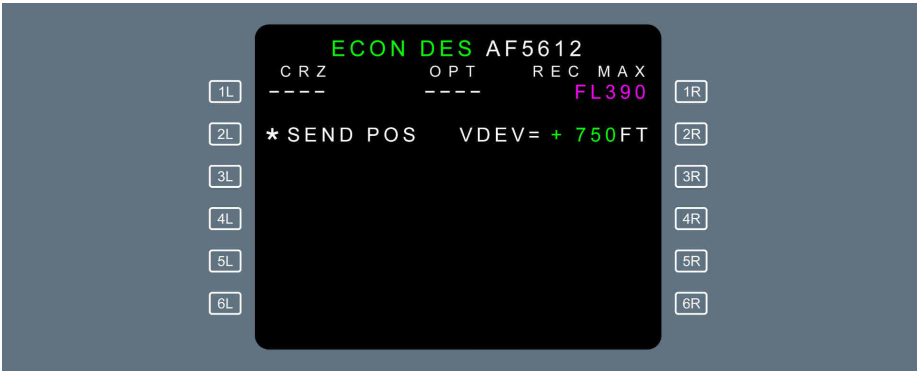
TITLE	Different for each flight phase (see above). The vertical phase is in large green font. The flight number is in large white font. EO is large amber font, if the engine-out condition is detected.
Line 1 CRZ (blue)	This line displays the cruise flight level, inserted on the INIT A page or directly in this field in blue. If the flight crew uses the FCU to select an altitude that is higher than the one displayed in this field, the system changes the number displayed to agree. In this line, the flight crew cannot insert a flight level that is lower than the FCU-selected altitude. This field shows dashes when the descent or approach phase is active.
OPT	This field displays the optimum flight level (in green), that is computed based on the current gross weight, cost index, temperature and wind. This flight level requires a 5 min minimum cruise at a minimum cruise flight level of FL 100. It displays dashes if an engine-out is detected.

REC MAX	This field displays the recommended maximum altitude (in magenta), that is computed based on the current gross weight and temperature, and assuming that the anti-ice is off (if icing conditions are expected, use the performance application of the EFB). It provides the aircraft with a 0.3 g buffet margin, a minimum rate of climb at MAX CL thrust, and level flight at MAX CRZ thrust. This field is limited to FL 398. If one engine is out, this field displays the recommended maximum engine-out altitude, that is computed based on the long-range cruise speed and assuming that anti-ice is off. _Note:_ *The OPT or REC MAX field may display a value up to FL 398. However, the current aircraft's maximum certified altitude is 39 100 ft. Disregard the OPT or REC MAX value, if it exceeds FL 391.*
[2L] REPORT	This key calls up the REPORT PAGE.
[2R] VDEV	This field is displayed during the descent and approach phases, when NAV mode is engaged, or in HDG mode, provided that the crosstrack error (XTK) is less than 5 NM. It displays the vertical deviation between the aircraft's current altitude and the FMS-computed vertical profile.



```

Line 3 POSITION UPDATE AT ◁*	The flight crew can update the FMS position via this field by entering either the IDENT of a waypoint, a NAVAID, an airport, a latitude and longitude (LL), a place/bearing/distance, or a place-bearing/place-bearing (PBX). When the flight crew has entered this data, this field changes its format to: “CONFIRM UPDATE AT”, followed by the latitude/longitude and IDENT of the inserted position with an asterisk. The flight crew presses the right-hand key adjacent to the asterisk to confirm the update, when the aircraft overflies the inserted position.

Note: *If no IDENT has been inserted, the field displays “ENTRY” instead of an IDENT.*

Line 4 BRG/DIST	On this line, the pilot can enter an airport, a waypoint, a NAVAID, or a runway. The pilot may enter each as an IDENT, a latitude/longitude (LL), a place/bearing/distance (PBD), or a place-bearing/place-bearing (PBX). The field then shows the FMGC-computed bearing and distance to the site from the aircraft's present position. The last distance digit is in 1/10 of a NM. If it does not have an IDENT, the point is called “ENTRY”. Example: BRG/DIST 340 °/95.4 to ENTRY

[5L] PREDICTIVE GPS	This prompt gives access to the PREDICTIVE GPS page.

[5R] GPS PRIMARY	This prompt is displayed, when the FMS navigation mode is GPS PRIMARY. When GPS PRIMARY is not available, or navigation mode is not GPS/IRS, this field is blank. The scratchpad displays the relevant “GPS PRIMARY″ message when this prompt appears; and “GPS PRIMARY LOST”, when the field turns to blank.
[6L] REQUIRED	This field displays the default value for the required navigation accuracy level. The pilot can modify it. Provided no pilot entry has been made, the default value changes according to the actual flight area (En route, terminal, approach).
ACCUR HIGH/LOW	This field shows the flight management system's estimate of the navigational accuracy. “HIGH” indicates that the FMS estimates that the navigational accuracy matches the accuracy criteria of the area currently flown. “LOW” indicates that the criteria are not matched.
[6R] ESTIMATED	This field displays the current estimated navigation accuracy value (EPE) as computed by the FMS.

```

[5L] PREDICTIVE GPS	This prompt gives access to the PREDICTIVE GPS page.
[5R] GPS PRIMARY	This prompt is displayed, when the FMS navigation mode is GPS PRIMARY. When GPS PRIMARY is not available, or navigation mode is not GPS/IRS, this field is blank. The scratchpad displays the relevant “GPS PRIMARY″ message when this prompt appears; and “GPS PRIMARY LOST”, when the field turns to blank.
[6L] REQUIRED	This field displays the default value for the required navigation accuracy level. The pilot can modify it. Provided no pilot entry has been made, the default value changes according to the actual flight area (En route, terminal, approach).
ACCUR HIGH/LOW	This field shows the flight management system's estimate of the navigational accuracy. “HIGH” indicates that the FMS estimates that the navigational accuracy matches the accuracy criteria of the area currently flown. “LOW” indicates that the criteria are not matched.

[6R] ESTIMATED	This field displays the current estimated navigation accuracy value (EPE) as computed by the FMS.

PREDICTIVE GPS PAGES

Note: 1. *This page is only operative with Honeywell ADIRS.*
2. *This page cannot be used as a substitute to determine pre-flight planning RAIM availability when required by operational regulations. Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed).*

The pilot accesses this page by pressing the PREDICTIVE GPS prompt of the PROG page.
This page displays information relative to theoretical predictive availability of GPS PRIMARY at destination, and at any waypoint selected by the crew.

[ ]
```

[1L] DEST	Destination, airport as currently selected in active flight plan. It is not modifiable. This field displays dashes, when no destination airport exists.

[1R] ETA	This field is defaulted to the Estimated Arrival Time, as computed by the FMS (small blue font). The pilot may enter a value in this field (large blue font). Amber boxes are displayed, when no prediction exists, or the crew entry has been cleared.
Line 2 PRIMARY Y/N	Predicted primary status at destination airport, at the following times: Estimated time of arrival ±5, 10, 15 min. Availability of GPS PRIMARY at the corresponding time is indicated by Y, when PRIMARY is predicted to be available; and, by N, when GPS PRIMARY is predicted not to be available. These fields are blanked when the destination [1L] field, or the time [1R] field is not defined.
[3L] WPT	The pilot may enter a reference waypoint in this field. Blue brackets are displayed, when no entry has been made.
[3R] ETA	When a reference waypoint has been entered in the [3L] field, amber boxes are displayed. The crew is requested to enter a reference time in this field.
Line 4 PRIMARY Y/N	Information equivalent to [2L] / [2R] is displayed for any pilot-selected waypoint. The corresponding time of arrival is also displayed.
Line 5 DESELECTED SATELLITES and Line 6 SATELLITES	Enables the pilot to deselect up to four satellites by inserting the corresponding satellite number ; the number is then displayed in large blue font. When deactivated, the satellites are not considered for predictive GPS availability at destination, or at the selected waypoint. The deselection is cancelled when the entry is cleared (blue brackets are displayed), or the field is overwritten by a different satellite number.

REPORT PAGE IN FLIGHT

This page displays information related to the FROM, TO, NEXT and DEST waypoints, as well as the current wind, temperature, distance and time to the next cruise profile change.

TITLE (White)	Displays the flight number. This line displays EO in amber, in case an engine-out is detected.
[1L] OVHD (green)	Displays the last sequenced waypoint. This field never displays the pseudo-waypoints and the F-PLN markers (T-P, PPOS, IN-BND, OUT-BND).

[1R] UTC/TIME ALT (green)	This field displays the time and altitude recorded at the time of sequence.
[2L]-[2R] TO (green)	This field displays the active waypoint, predicted time of arrival and predicted altitude at this waypoint. *Note:* *Time and altitude values are identical to those values on the F-PLN pages.*
[3L]-[3R] NEXT (green)	Same information for the next waypoint.
[4L] [4R] SAT/T.WIND/FOB (green)	This field displays the static air temperature, the wind direction and velocity, and the FOB recorded at waypoint sequencing.
[5L] T/D/UTC/DIST (green)	This field displays the estimated time, and the distance to go to the next change of the cruise profile (T/D, S/C, S/D). These data are only displayed when the cruise phase is active.
[5R] SEND* (blue)	The crew uses this prompt to downlink a position report. This field may be blank, depending on airline policy.
Line 6 DEST/UTC/DIST/EFOB	This field displays the estimated time of arrival, the distance along the F-PLN, and the estimated fuel on board (DEST EFOB) at destination. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page.. This display is identical to the information on the F-PLN pages.

Note: *No data can be inserted or modified on the REPORT page.*

RADIO NAV PAGE

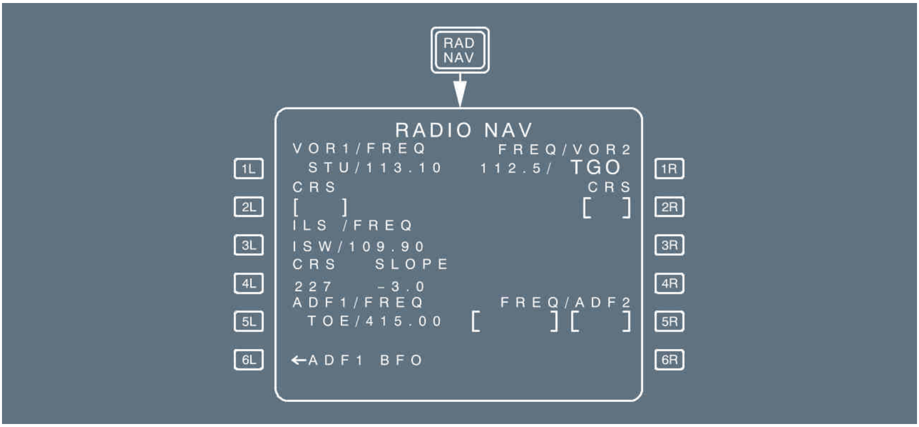
58 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11597**

This page enables the pilot to select or verify the radio NAVAIDs, tuned for display purposes only. These NAVAIDs include: VOR, VOR/DME, TAC, VORTAC, ILS, and ADF.



```
           RADIO NAV
VOR1/FREQ             FREQ/VOR2
 STU/113.10      112.5/ TGO
CRS                         CRS
[    ]                    [   ]
ILS /FREQ
ISW/109.90
CRS    SLOPE
227     -3.0
ADF1/FREQ             FREQ/ADF2
 TOE/415.00  [      ][    ]

←ADF1  BFO
```

Line 1 VOR1/FREQ FREQ/VOR2	This line displays the identifiers and frequencies of VORs 1 and 2, whether they are automatically or manually tuned. To manually tune a VOR, the pilot inserts the IDENT or frequency. If the IDENT is not in the database, the new NAVAID page comes up. A “clear” action reverts the selection to the autotuned NAVAID.
Line 2 CRS	This line displays courses for the NAVAIDs in Line 1. The pilot can manually enter the courses through these fields.
[3L] LS/FREQ	This field displays the IDENT of an ILS and its frequency (for ILS). It is autotuned, if the ILS is associated to the departure runway, or if the flight plan contains an ILS approach. The flight crew may also enter an ILS manually. When the manually entered ILS differs from the ILS that the FMS would autotune, “RWY-LS MISMATCH” appears.

[4L] CRS SLOPE	CRS: This field displays the course associated with the LS displayed in Line 3. It comes up automatically if an LS is autotuned, or if an LS has been manually tuned via its IDENT. Otherwise, the course must be entered manually. The course may be backbeam (Bxxx) or frontbeam (Fxxx).. SLOPE: This field displays the slope associated with the LS displayed in Line 3. It comes up automatically if an LS is autotuned for approach, or if an LS has been manually tuned via its IDENT. *Note:* *1. The slope does not apply to LOC only, LDA, SDF or Backbeam approaches.* *2. If the flight crew intends to manually tune an ILS that is not in the navigation database or to manually tune an ILS by its frequency (ident not entered), and if they do not enter the course, the flight crew will not be able to arm approach modes.*
Line 5 ADF1/FREQ FREQ/ADF2	This line displays the identifiers and frequencies of ADFs 1 and 2. The pilot can use the IDENT or the frequency to manually tune the ADF.
Line 6 ADF1/BFO BFO/ADF2	When an ADF is selected, these fields display an ADF/BFO prompt. The flight crew presses the key once to erase the arrow and put the ADF in BFO mode. A clear action brings the arrow back and cancels BFO.

Note:
- *The autotune function only works for NAVAIDs stored in the database.*
- *When tuning manually, the operator should use the IDENT, rather than the frequency, unless the NAVAID is not in the database.*
- *Manually-tuned frequencies are displayed in large font.*

SECONDARY PAGES

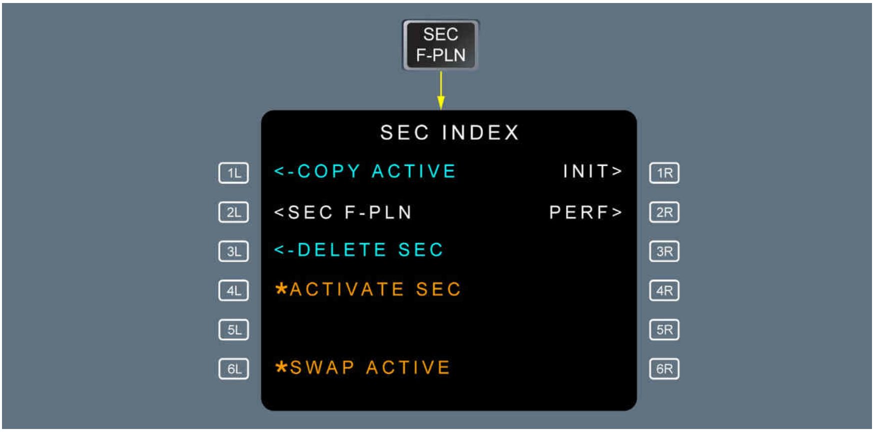
Ident.: DSC-22_20-50-10-25-00000608.0010001 / 30 AUG 18

59 **Applicable to: MSN 10949-11597**

The SEC F-PLN key on the MCDU console allows the flight crew to call up the secondary index page and the secondary flight plan page. The secondary flight plan is generally for a diversion, for predictable runway changes for takeoff or landing, or for training.
There are two types of secondary index pages. The type selected depends on the presence of a secondary flight plan.

SECONDARY INDEX PAGE

A SECONDARY FLIGHT PLAN IS ALREADY DEFINED



```
SEC INDEX
<-COPY ACTIVE         INIT>
<SEC F-PLN            PERF>
<-DELETE SEC
*ACTIVATE SEC

*SWAP ACTIVE
```

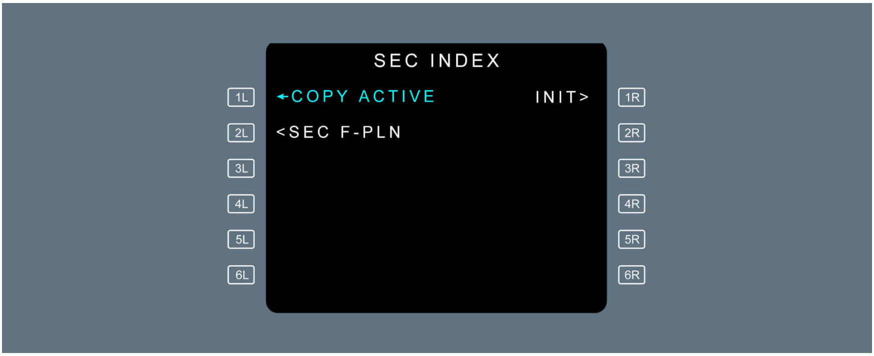
[1L] COPY ACTIVE	The flight crew presses this key to copy the active flight plan into the secondary flight plan and delete the previous secondary plan.
[2L] SEC F-PLN	The flight crew presses this key to call up the secondary flight plan pages.
[3L] DELETE SEC	The flight crew presses this key to delete the current secondary flight plan.
[4L] ACTIVATE SEC	The flight crew presses this key to activate the secondary flight plan as the active flight plan.

Note: *"ACTIVATE SEC" routinely appears if the HDG/TRK mode is active. If the NAV mode is active, "ACTIVATE SEC" appears only if the active and secondary flight plans have a common active leg.*

[6L] SWAP ACTIVE	The flight crew presses this key to swap the active flight plan and the secondary flight plan. Therefore, all the following apply: - The active flight plan becomes the secondary flight plan - The secondary flight plan becomes the active flight plan. When the NAV mode is engaged, the function is only available if the current leg of the active flight plan is identical to its associated leg in the secondary flight plan.
[1R] INIT	The flight crew presses this key to call up the SEC INIT A page.

[2R] PERF	The flight crew presses this key to call up the performance pages for the secondary flight plan.

A SECONDARY FLIGHT PLAN IS NOT DEFINED



SEC INDEX
←COPY ACTIVE INIT>
<SEC F-PLN

[1L] COPY ACTIVE	The pilot presses this key to copy the primary active flight plan into the secondary flight plan.
[2L] SEC F-PLN	The pilot presses this key to call up the secondary flight plan pages.
[1R] INIT	The pilot presses this key to call up the secondary INIT page. It is similar to the active INIT page, but blue brackets replace all the amber boxes.

SECONDARY FLIGHT PLAN PAGES

The secondary flight plan pages A and B are identical to those of the active flight plan, but are automatically sequenced, only when the secondary is copied from the primary and their active legs are identical.
The active and secondary flight plans pages differ from each other as follows:

SECONDARY LATERAL REVISION PAGES:

- ERASE and INSERT are not displayed.
- FIX INFO is not available.
- A lateral revision of the secondary flight plan does not create a temporary flight plan: All revisions are directly applied to the secondary flight plan.

SECONDARY VERTICAL REVISION PAGES:

A vertical revision on the secondary flight plan does not create a temporary flight plan.

SECONDARY INIT A AND B PAGES:

- They use blue brackets, instead of amber boxes.
- They have no align prompt.
- They do not provide for slewing or entering data in the 4L-4R fields (airport reference).

SECONDARY STEP ALTITUDE PAGES:

These pages operate as the primary STEP ALT page, except that optimal step, savings are not available.

SECONDARY WIND PAGES:

They have no history wind page.

SECONDARY PERFORMANCE PAGES:

- All boxes are replaced by blue brackets.
- They have no engine-out mode, no engine-out long range cruise cost index.
- They have no expedite predictions.
- They have no ACTIVATE/CONFIRM APPROACH PHASE prompt.
- They have no PRED TO ALTN predictions on the PERF CLB and PERF DES pages.
- They have no engine-out drift down, no top of descent, no cabin descent rate information on the PERF CRZ page.

The secondary flight plan has no FUEL PRED page.

SECONDARY INIT A PAGE IS ALSO USED TO REQUEST OR DISPLAY AN UPLINK INIT MESSAGE RECEIVED AFTER ENGINE START.

This uplink INIT message can be cleared or inserted as SECONDARY INIT data.

BACK UP NAV PAGES

Ident.: DSC-22_20-50-10-25-00013508.0019001 / 29 JAN 13

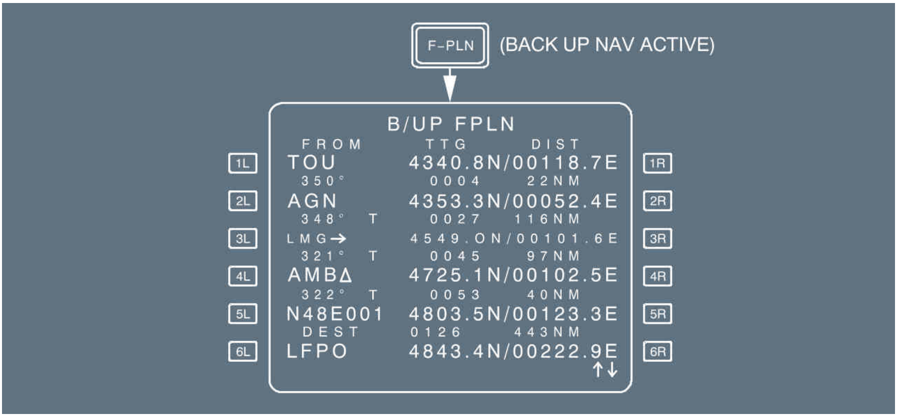
60 **Applicable to: MSN 03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The MCDU features a back up navigation function which provides simplified point-to-point GPIRS and IRS based navigation in case of a dual FM failure.
The backup Navigation mode allows limited lateral flight planning within the MCDU, that can be used to drive the Navigation Display and provides relative path position information and auto-sequencing of the Backup Navigation flight plan. The Backup Navigation flight plan reflects, as much as possible, the active primary FM flight plan upon its initial activation.
During FM normal operation, the F-PLN is continuously downloaded in the MCDU memory: the BACK UP NAV function links the MCDU of the failed FM to its onside IRS. All navigation data related to the MCDU F-PLN are displayed on the associated ND.
BACK UP NAV function is activated on the MCDU MENU page by pressing the NAV B/UP prompt.
The MCDU back-up F-PLN may accept a maximum of 165 legs, including information such as waypoint position/identification, leg type, discontinuity, overfly and turn direction information (radial, pattern, heading leg... cannot be part of the MCDU F-PLN). No secondary or temporary F-PLN exists.

BACK UP NAV pages display the data related to the BACK UP NAV function. There are six pages available while BACK UP NAV is active:
- B/UP F-PLN
- B/UP F-PLN for DIRECT TO
- B/UP PROG
- B/UP IRS for onside IRS (1+2)
- B/UP IRS 3
- B/UP GPS (if the GPS is installed)

B/UP F-PLN PAGE

The B/UP F-PLN page displays the MCDU F-PLN data. The pilot calls up this page by pressing the F-PLN key while B/UP NAV is active.



```
           B/UP FPLN
 FROM        TTG        DIST
TOU      4340.8N/00118.7E
 350°        0004       22NM
AGN      4353.3N/00052.4E
 348°  T     0027      116NM
LMG→     4549.0N/00101.6E
 321°  T     0045       97NM
AMBΔ     4725.1N/00102.5E
 322°  T     0053       40NM
N48E001  4803.5N/00123.3E
 DEST      0126      443NM
LFPO     4843.4N/00222.9E
                          ↑↓
```

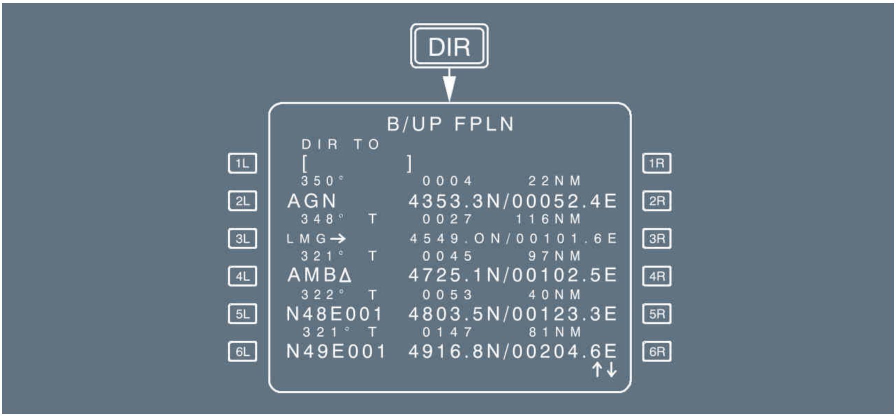
TITLE line 1 to line 5	B/UP F-PLN is displayed in a white large font Display consecutive waypoints with their associated latitude/longitude. If a waypoint is to be overflown, an overfly symbol (△) is displayed after the identifier. If a turn is specified into the next leg, a large font arrow is displayed after the identifier. Label lines contain the bearing, time to go and distance to the next waypoint displayed in small font.

white	bearing
green	time to go and distance
BRG	Between FROM and TO waypoints: True or Mag depending on the TRUE pb-sw ◁ position. T is displayed when the bearing is true referenced. Between other waypoints: out bound true track of the great circle joining the 2 related waypoints, independant of TRUE pb-sw ◁ .
TTG	HHMM limited to 9 959. Time between the 2 related waypoints.
DIST	NM limited to 9 999.

line 6 DEST	DEST airport identifier and associated latitude/longitude. DIST to destination is computed as the direct distance from the aircraft to the active waypoint plus the along flight plan distances. time to go to destination is computed as distance to destination divided by ground speed. TTG and DEST are dashed if aircraft position is unavailable.

B/UP F-PLN (DIR TO)PAGE

The pilot calls up this page using the DIR key on MCDU while BACK UP NAV is active and aircraft position is valid.



```
          B/UP FPLN
 DIR TO
 [            ]

TEMP PAGES

Applicable to: MSN 10949-11597

Ident.: DSC-22_20-50-10-25-A-00022370.0001001 / 30 AUG 18

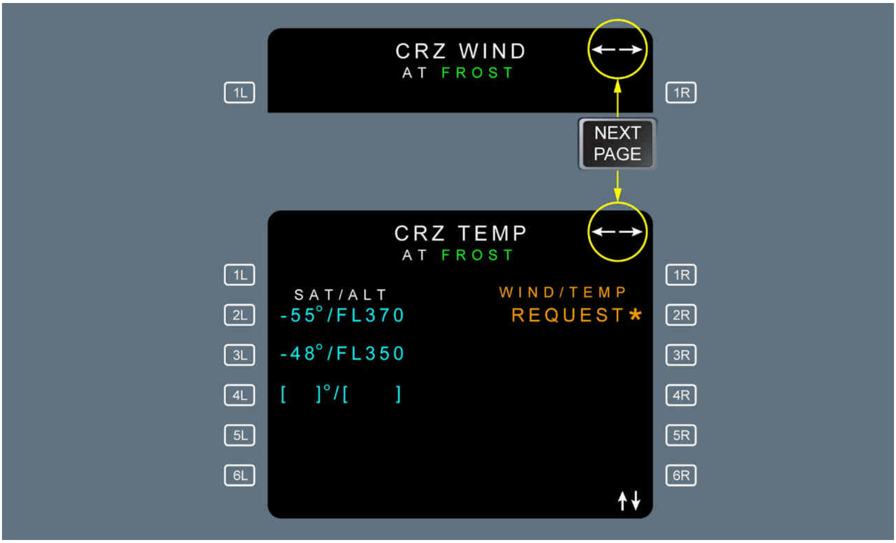
61 ### GENERAL

A temperature profile in cruise and descent is necessary to provide the flight crew with reliable predictions and performance. Temperature pages enable the flight crew to enter and/or check the temperatures propagated by the FMGS or sent by ACARS for the various flight phases. There are two temperature pages:

- CRZ TEMP Page, accessible via CRZ WIND Page and by pressing NEXT PAGE on MCDU, and
- DES TEMP Page, accessible via DES WIND Page and by pressing NEXT PAGE on MCDU. This page is only accessible with 4D ◁✳ or Enhanced RTA ◁✳ options

Ident.: DSC-22_20-50-10-25-A-00022371.0001001 / 30 AUG 18

62 ### CRZ TEMP PAGE



CRZ WIND
AT FROST

-48°/FL350
[ ]°/[ ]
WIND/TEMP
REQUEST*

TITLE	CRZ TEMP
AT [location]	[location] is the fix at which the temperature data is defined
[2L] to [5L] SAT/ALT	This displays up to 4 manual inserted, uplinked, or propagated temperatures: - Manual pilot entries or uplinked appear in large blue font, and - Propagated values appear in small blue font. To clear a manual or uplinked entry, the flight crew presses the CLR MCDU key. The pilot cannot clear a propagated entry. Attempting to clear a propagated SAT/ALT display NOT ALLOWED message. The pilot can override a propagated value. In this case, the value becomes a manual entry and it is possible to clear. The altitude is entered in feet MSL or flight levels, but is always displayed in flight level format. The SAT/ALT list is sorted by descending altitude order, starting from 2L. After each modification, the list is automatically sorted again.
[2R] WIND/TEMP REQUEST	Enable the flight crew to send a request for ACARS winds and temperatures.
← →	Enable the flight crew to use the NEXT PAGE MCDU key to revert to the CRZ WIND Page.
↑ ↓	Enable the flight crew to go to the next waypoint CRZ TEMP Page.

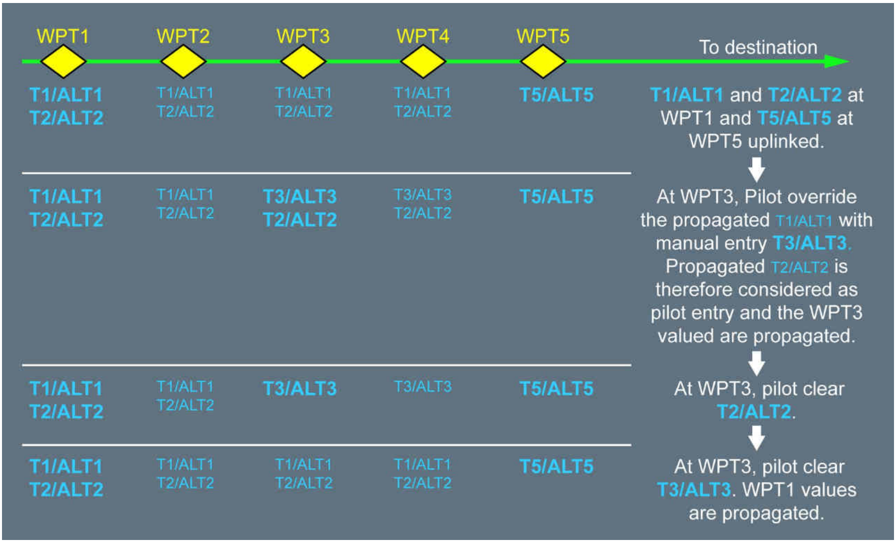
CRZ TEMP SAT/ALT ENTRIES AND MODIFICATION

Altitude entries for temperature are independent of a waypoint to the other. The entered altitudes are also independent of the wind altitudes.

A flight crew entry of SAT/ALT is propagated constantly down path (not up path) to the next waypoint (excluded) on which at least one SAT/ALT pilot entry is defined, or up to and that includes the last cruise waypoint.

When propagated SAT/ALT exist at a waypoint, if a manual entry of SAT/ALT at this waypoint is performed, all the remaining propagated SAT/ALT at this waypoint are considered as flight crew entries. The entry can be performed either on a line where propagated temperature exists or on a line where brackets are displayed. If the entry is performed on a line where a propagated temperature is defined, the manual entry overwrites this temperature. In addition, any propagated temperature defined on any other line is considered as a flight crew entry.

This mechanism provides the flight crew with a simple way to modify the ISA DEV at a waypoint, as illustrated below:



WPT1
WPT2
WPT3
WPT4
WPT5
To destination
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T5/ALT5
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T3/ALT3 T2/ALT2
T3/ALT3 T2/ALT2
T5/ALT5
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T3/ALT3
T3/ALT3
T5/ALT5
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T1/ALT1 T2/ALT2
T5/ALT5

T1/ALT1 and T2/ALT2 at WPT1 and T5/ALT5 at WPT5 uplinked.

At WPT3, Pilot override the propagated T1/ALT1 with manual entry T3/ALT3. Propagated T2/ALT2 is therefore considered as pilot entry and the WPT3 valued are propagated.

At WPT3, pilot clear T2/ALT2.

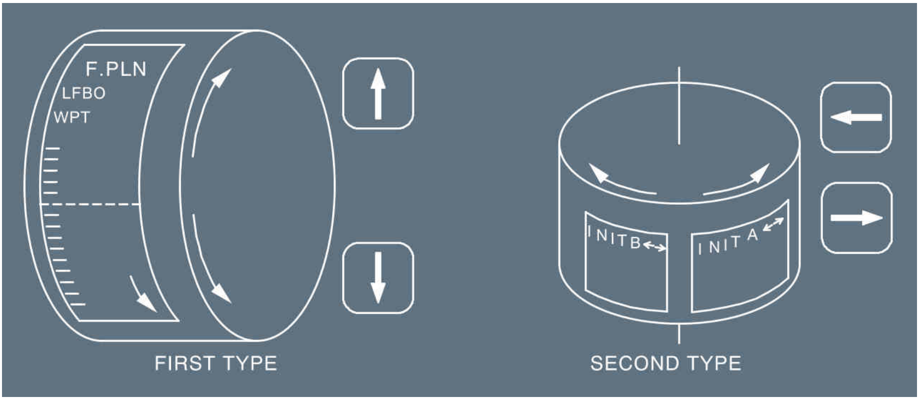
At WPT3, pilot clear T3/ALT3. WPT1 values are propagated.

FMS2 Thales

GENERAL

Ident.: DSC-22_20-50-10-28-00000813.0001001 / 14 MAY 12
Applicable to: MSN 04827-04860

The Flight Management and Guidance System (FMGS) displays information on several “pages”. When a page cannot display all of the assigned information, it cues the pilot to call up additional information. There are three types of pages, and each type has its particular way of cuing the pilot to call up additional information.



FIRST TYPE

When this page cannot simultaneously display all the information on the screen (more information than the six pairs of lines can hold), the pilot can scroll up or down the page.
In this case, the screen displays a ↑ ↓ symbol in the bottom right-hand corner (F-PLN pages, secondary F-PLN page, departure/arrival pages,...).

SECOND TYPE

When the information is on successive pages, the pilot presses the “→” or "←" keys to sequentially call up these pages.
In this case, an arrow is displayed in the top right-hand corner of the screen (INIT pages).

THIRD TYPE

When different types of information are on successive pages, the pilot calls up these pages by pressing the key adjacent to the prompts : >, < or *.

5R
6R
*

The flight crew selects a system by pressing the key adjacent to the name of that system.

The screen shows the name of the selected system in:
- Green, if communication is established.
- Blue, associated with the (SEL) indicator, until communication is established. The scratchpad displays “WAIT FOR SYSTEM RESPONSE”.
- White, associated with the (TIME OUT) indicator, if the MCDU cannot establish communication with the selected system.

When a system calls for the flight crew’s attention, the MCDU displays “REQ” next to the system’s name, and the “MCDU MENU” annunciator lights up.
When the flight crew presses the key next to the name of the system that requires attention, the “MCDU MENU” annunciator light goes off.
When the MCDU is communicating with a system other than the FMGC, the pilot should use the MCDU MENU page to revert to the FMGC system.

SELECT NAV B/UP	Pressing the [1R] key selects the NAV B/UP function and DESELECT NAV B/UP appears in the [1R] field. If the NAV B/UP is inoperative, the field is blank.
RETURN	This field is displayed when a function is active.

If the MCDU attempts to communicate with a system, “SEL” is displayed next to the system name.

INIT A PAGE

Ident.: DSC-22_20-50-10-28-00000815.0021001 / 17 MAY 21
Applicable to: MSN 04827-04860

The flight crew uses the INIT A page in pre-flight phase, to initialize the flight plan and align the inertial reference system.
The flight crew accesses this page by pressing the INIT key on the MCDU.
The INIT A page can be accessed on ground or in flight.
When in the done phase, the pilot can press the INIT key to begin the next preflight phase.

Note: *The flight crew may also call up this page by pressing:*
- *The “→” or “←” keys on the MCDU, when on the INIT B page, or*
- *The key next to “RETURN” or “INSERT” on the ROUTE SELECTION page.*

[1L] CO RTE (blue)	If the flight crew enters a company route number, the screen displays all data associated with that route (8 or 10 characters, depending on the pin program). Inserting the CO RTE into the RTE selection page also enters the CO RTE number in this field.

[2L] ALTN/CO RTE (blue)	This field is dashed, until a primary destination is entered in the 1R field. If a preferred alternate is associated with the primary destination in the Navigation Database, it is displayed in this field with the company route identification. The crew may manually enter an alternate and company route. If the preferred alternate is not associated with the primary destination, “NONE” is displayed in this field. When the alternate route and the primary destination do not match, the MCDU scratchpad displays “DEST/ALTN MISMATCH”. If the primary destination is changed, this field is modified accordingly.
[3L] FLT NBR (blue)	The flight number automatically appears in this field, if it is stored with the company route. The flight crew may modify it, or enter a new number here.
[5L] COST INDEX (blue)	This is usually stored in the database, along with the company route. The flight crew may modify it, or enter a new value here. It defaults to the last entered value, if a value is not stored in the database.
[6L] CRZ FL/TEMP (cruise flight level and temperature)	The cruise flight level is usually stored in the database, along with the company route. If not, it has to be entered manually. If no cruise flight level is entered, the system will not furnish predictions, while the aircraft is on ground. The flight crew has to enter the temperature at cruise flight level in order to refine the predictions. Otherwise, these are computed for ISA conditions. (If no sign is entered, the system uses a plus).
[1R] FROM/TO (blue)	The flight crew can enter a city pair in this field (ICAO codes for city of origin and destination). This entry automatically deletes any previously-entered company route, and calls up the route selection page (if a company route exists). If one airfield of the pair is not in the database, the display changes to the NEW RWY page.

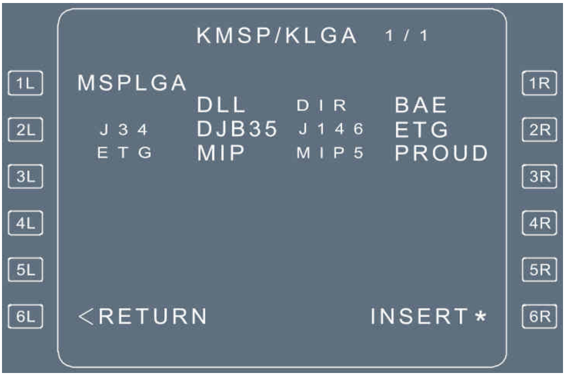
[2R] INIT REQUEST ◁	This prompt is displayed, if the pilot did not enter an active flight plan, or entered a flight number or a company route that is not in the aircraft database. Selecting this prompt sends the ground a request for active flight plan initialization (downlink message). When the asterisk is not displayed, a downlink message cannot be sent. The uplink flight plan is automatically inserted in the active flight plan, before engine start, provided that an active flight plan does not exist. After engine start, the uplink flight plan is sent to the secondary flight plan, and manually-inserted or rejected (Refer to DSC/Auto Flight - Flight management/AOC Functions ◁).
[3R] IRS INIT	The flight crew presses this key to access the IRS INIT page.
[4R] WIND	The crew presses this key to access the pages, unless a temporary flight plan exists. In this case, the scratchpad displays “TEMPORARY F-PLN EXISTS”.
[5R] TROPO (blue)	The default tropopause altitude is36 090 ft. The pilot can use this field to modify the tropopause altitude (99 990 ft maximum).
[6R] GND TEMP (blue)	When a CO RTE or a FROM/TO is defined, the ground temperature value corresponds to the standard ISA temperature at the origin airport elevation. The flight crew can modify this value as required on the pre-flight phase.

ROUTE SELECTION PAGE

Ident.: DSC-22_20-50-10-28-00000818.0001001 / 16 MAR 11
Applicable to: MSN 04827-04860

This page displays all the company routes, stored in the database, that are associated with the inserted city pair. They can either be called up manually, or displayed automatically.

- Manually: The pilot presses the FROM/TO or ALTN key on the INIT A page when a city pair is displayed.
- Automatically: The system displays it, when the pilot enters a city pair or defines an alternate on the INIT A page of the active or secondary flight plan.



```
          KMSP/KLGA     1/1
MSPLGA
             DLL      DIR     BAE
   J34       DJB35    J146    ETG
   ETG       MIP      MIP5    PROUD

<RETURN                  INSERT*
```

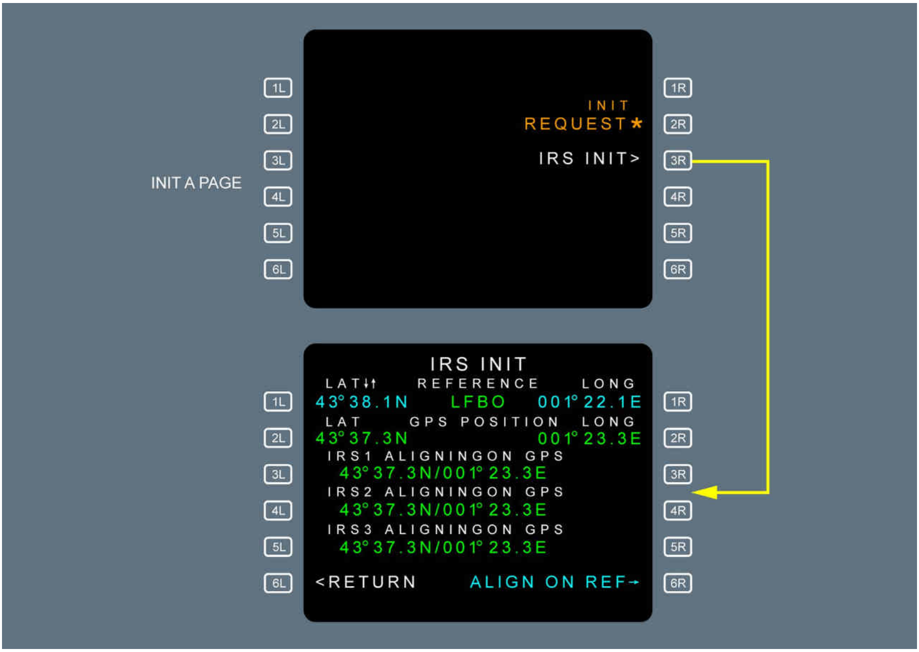
TITLE	Idents for the city pair inserted on the INIT A page. (The numbers in the upper right-hand corner are the total number of company routes from this city pair stored in the database).
[1L]	This field shows the name of the company route. "NONE" appears, if there is no company route for this city pair.
Line 2 to Line 5	These fields display the various elements of the company route : Waypoints appear in large green font, and airways in small white font.
[6L] RETURN	The pilot presses this key to return to the INIT A page.
[6R] INSERT or SELECT	This prompt displays an amber INSERT (blue for the secondary flight plan), if the pilot accessed the page from the INIT A (or secondary INIT A) page. It displays SELECT (blue) if the crew accessed the page from the alternate page. The pilot presses this key to insert the displayed company route in the respective flight plan and to return the display to the accessing page.

Note: *The pilot can scroll to display the rest of the route (if one page does not show it all), or other company routes for this city pair.*

IRS INIT PAGE

Ident.: DSC-22_20-50-10-28-00009556.0052001 / 30 AUG 18
Applicable to: MSN 04827-04860

The flight crew uses the IRS INIT page to align the inertial reference system. The crew accesses this page, by pressing the IRS INIT key on the INIT A page.



```
                 INIT
            REQUEST*
            IRS INIT>
```

```
          IRS INIT
 LAT⇅    REFERENCE     LONG
43°38.1N    LFBO   001°22.1E
 LAT    GPS POSITION   LONG
43°37.3N           001°23.3E
 IRS1 ALIGNINGON GPS
  43°37.3N/001°23.3E
 IRS2 ALIGNINGON GPS
  43°37.3N/001°23.3E
 IRS3 ALIGNINGON GPS
  43°37.3N/001°23.3E
<RETURN       ALIGN ON REF→
```

Line 1 LAT-REFERENCE-LONG	This line provides the latitude and longitude of the FM reference position. This reference is extracted from the navigation database. The flight crew can modify this reference. Only when the FM reference position matches the origin airport position, the airport identifier is displayed in green. Otherwise, there are dashes at the place of the airport identifier. Latitude and longitude of the FM reference position are displayed in blue. The flight crew can modify the latitude and longitude values using the scroll keys.
Line 2 LAT-GPS POSITION-LONG	These lines display the IRS 1-2-3 alignment state, source and latitude/longitude.
Line 3 to 5	The alignment status can be ALIGNING ON XXX, or ALIGNED ON XXX or IN ATT. XXX is the alignment source and can be GPS or CDU or REF. It is displayed in white font. The latitude and longitude values are displayed in green.
[6L] RETURN	This prompt enables the crew to return to the INIT A page.

[6R]	If a reference is available, this field displays ALIGN ON REF → in blue which is replaced by CONFIRM ALIGN * in amber when 6R prompt is pressed. Pressing again the 6R prompt enables the transmission of the FM reference position displayed in line 1.

WIND PAGES

Ident.: DSC-22_20-50-10-28-00009557.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

Winds in climb, cruise, descent, and approach are necessary to provide the pilot with reliable predictions and performance. Wind pages enable the pilot to enter and/or review the winds propagated by the FMGS or sent by ACARS for the various flight phases.

Note: *1. On the WIND pages, wind direction is always true-referenced.*
2. On the WIND pages, pending wind data exist as soon as a wind entry or a modification is performed on any of the WIND pages and until WIND UPDATE or WIND CANCEL is selected.

CLIMB WIND PAGE

This page enables the pilot to enter and/or review predicted wind vectors (direction and velocity) at up to 5 different levels.

THE CLIMB WIND PAGE IS ACCESSED FROM:

TITLE	"CLIMB WIND" is displayed in large white font. “DRAFT” is displayed next to “CLIMB WIND”, in yellow large font, when pending wind data exist for the active flight plan.

[1L] to [5L] TRU WIND/ALT	This field displays the winds, entered at various climb altitudes: before climb phase, in yellow when pending wind data exist, and blue otherwise. In green, after climb phase activation. This field may also display history winds. Large blue brackets are displayed before any wind entry. Flight crew-entered winds are displayed in large blue font. History wind data is displayed in small green font. Upon sequencing the top of climb, the climb winds are deleted.
[6L] RETURN or WIND CANCEL	The RETURN prompt is displayed in large white font, when no wind entry is performed. Selecting this prompt reverts to the access page. The WIND CANCEL prompt appears in amber, as soon as a wind entry is performed. It is used to cancel a wind data update. *Note:* *Climb winds are not deleted, when the origin airport is changed.*
[1R] HISTORY WIND	This key calls up the history wind page and is only displayed in the preflight phase. It cannot be modified (white font), but can be inserted into the CLIMB WIND page by using the 6R key and modified accordingly.
[3R] WIND REQUEST	Pressing this key sends a request for AOC winds. (Refer to DSC-22_20 Auto Flight - Flight Management / 70 AOC Functions / B Wind Data / Wind Data - Request for Wind Data).
[5R] NEXT PHASE	Pressing this key calls up the CRZ WIND page, or the DESCENT WIND page, if no cruise waypoint exists. It is displayed in white font.
[6R] WIND UPDATE	This prompt is displayed in amber, as soon as a wind entry or a modification is performed. When it is pressed winds are inserted.

HISTORY WIND PAGE

065°/045  FL370
<CLIMB WIND        SELECT→
```

[1L] to [5L]	The history winds are given for the default altitudes of FL 050, FL 150, FL 250 and the CRZ FL of the previous flight. They are displayed in yellow when pending data exist, in blue otherwise.
[6L] CLIMB WIND	This key reverts the display to the CLIMB WIND page. It is displayed in white font.
[6R] SELECT	This key inserts the history wind values into the CLIMB WIND page. This prompt is displayed in amber, if no wind has been inserted yet.

CRZ WIND PAGE

The CRUISE WIND page allows the entry and display of predicted wind data (direction and velocity) for each cruise waypoint.
Until weight data is entered and predictions are computed, cruise winds may be entered at any waypoint that is not part of a SID, STAR or approach.
The CRZ WIND page also enables the definition of a temperature at a given altitude to refine the predicted temperature profile. It is accessed from the CLIMB or DESCENT WIND page, or by pressing the WIND DATA prompt on the VERT REV page of a cruise waypoint. The flight crew can scroll from a cruise waypoint to the next one by using the MCDU scroll keys. Once the last cruise waypoint is reached, the “up arrow”slew key allows access to the first cruise waypoint.
The flight crew can enter wind data for each cruise waypoint at up to four different altitudes.

Note: *This set of four altitudes is defined for the whole cruise phase. Entering a new altitude at a cruise waypoint will remove the previous altitude from the computations.*

TITLE	”CRZ WIND AT” is displayed in white font. “DRAFT” is displayed next to “CRZ WIND AT”, in yellow large font, when pending wind data exist for the active flight plan. The cruize waypoint at which the wind data is defined is displayed in green large font.
[1L] to [4L] TRU WIND/ALT	These fields display the entered winds at various altitudes. The entered winds are propagated at the same altitude to the downpath cruise waypoints, if no other winds are entered. The propagated wind direction and velocity are displayed in small font. Both the uplinked winds and the pilot-entered winds are displayed in large font. Wind data can be modified during cruise. Wind data is displayed in yellow when pending winds exist and in blue when inserted.

[5L] SAT/ALT	This field enables the crew to enter a temperature at a given flight level, or it displays a propagated value. The flight crew must enter both temperature and altitude at the first entry. They can then modify the temperature or the altitude independently. SAT and Altitude are displayed in yellow when pending winds exist and in blue otherwise.
[6L] RETURN or WIND CANCEL	The “< RETURN” prompt is displayed when no modification has been performed on any WIND page. Selecting this prompt reverts to the page from which WIND pages have been accessed when modifications have been performed on any WIND page, the “WIND CANCEL“ prompt is displayed. Selecting this prompt cancels all modifications to the WIND pages.
[2R] WIND REQUEST	Pressing this key sends a request for ACARS winds. (Refer to DSC-22_20 Auto Flight - Flight Management / 70 AOC Functions / B Wind Data / Wind Data - Request for Wind Data).
[4R] PREV PHASE	This prompt is displayed in white in Preflight, Takeoff, Climb, Done and Go-Around phases. Pressing this prompt calls up the CLIMB WIND page.
[5R] NEXT PHASE	This prompt is displayed in white. Pressing this prompt calls up the DES WIND page.
[6R] WIND UPDATE*	This prompt is displayed when entries or modifications have been performed on any WIND page. Selecting this prompt inserts all the modifications performed on the WIND pages. Predictions are dashed on the F-PLN pages during the recomputation time. CRZ WIND page automatically reverts to F-PLN page, if the secondary flight plan is activated.

DESCENT WIND PAGE

This page enables the pilot to define and display the winds used for computing the descent profile at up to 5 descent altitudes.
The pilot calls it up by selecting NEXT PHASE on the CRUISE WIND page, or the WIND prompt on the VERT REV page.

TITLE	”DESCENT WIND” is displayed in large white font. “DRAFT” is displayed next to “DESCENT WIND” in yellow large font when pending wind data exist for the active flight plan.
[1L] to [5L] TRU WIND/ALT	These lines display inserted winds or uplinked winds: in yellow when pending data exist, and in blue otherwise, prior to activating the descent phase (modifiable values). In green after descent phase activation (not modifiable values). An entry of “GRND” in the “ALT” field is seen as the wind at ground level. This wind is copied on to the PERF APPR page (and corrected for the magnetic variation), and used for the computation of the predictions. A clear action on one key reverts the line to blue brackets.

[6L] RETURN or WIND CANCEL	The RETURN prompt is displayed in white large font, when no wind entry is performed. Selecting this prompt reverts to the access page. The WIND CANCEL prompt appears in amber, as soon as a wind entry is performed. It is used to cancel a wind data update.

Note: Descent and alternate winds are deleted, if the destination airport is changed.

[1R] ALTN WIND	This field is only displayed when an alternate is defined. The flight crew-entered or uplinked value is displayed in large yellow font when pending data exist, and in blue otherwise. It can always be modified by the pilot.
[2R] FLXXX	This field displays an uplinked alternate cruise altitude in the label line. If no uplink is done, this field displays the FMS alternate cruise flight level in small green font.
[3R] WIND REQUEST	Pressing this key sends a request for ACARS winds (Refer to DSC-22_20 Auto Flight - Flight Management / 70 AOC Functions / B Wind Data / Wind Data - Request for Wind Data).
[4R] PREV PHASE	Pressing this key calls up the CRZ WIND page. The prompt is erased after the top of descent is sequenced. It is displayed in large white font.
[6R] WIND UPDATE	This prompt is displayed in amber, as soon as a wind entry or a modification is performed. Pressing the up (down) scroll key will display the data at the next (previous) downpath (up path) descent waypoint.

INIT B PAGE

Ident.: DSC-22_20-50-10-28-00000824.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

This page is used to initialize the gross weight and center of gravity values, before starting the engines.
The crew can call it up from the INIT A page, by pressing the “→” or “←” key on the MCDU, as long as the engines have not been started.
This page automatically reverts to the FUEL PRED page after the first engine is started.
The FMGC will stop using the pilot-entered block fuel and will compute its predictions based on the FOB indicated by the FQI computer (or the FAC as backup) from that moment on.

[1L] TAXI (blue)	This is the taxi fuel, that defaults to a preset value, (usually 200 kg or 400 lb in the AMI file). The crew can change the value through this field.
[2L] TRIP/TIME (green)	This field displays the trip fuel and time when predictions are available. The crew cannot modify these values.
[3L] RTE RSV/% (blue)	This field displays the contingency fuel for the route and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The crew can either enter a fuel quantity, a percentage.

[4L] ALTN/TIME (blue/green)	Displays alternate trip fuel and time, assuming that the Cost Index = 0 and that the aircraft flies at the default cruise flight level. (*Refer to DSC-22_20-30-10-18 Alternate Function - Review and Selection of Alternate Airport*). The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.
[5L] FINAL/TIME (blue)	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). Before any crew entry, the FINAL field is dashed and FINAL TIME field is defaulted to the value specified in the AMI file (typically 30 min). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL with the aircraft in CONF 1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB (blue)	Displays the expected minimum fuel at destination. It is equal to the ALTN + FINAL fuel. This field can be modified by the flight crew, and is also impacted by the modification of ALTN and/or FINAL fuel. *Note:* *If flight crew entry of MIN DEST FOB is lower than ALTN + FINAL fuel, the message “CHECK MIN DEST FOB” is triggered on the MCDU.*
[1R] ZFWCG/ZFW (blue)	Displays the Zero Fuel Weight (ZFW) and Zero Fuel Weight CG (ZFWCG). The flight crew must enter the ZFW/ZFWCG values (as appropriate) to obtain a speed profile and predictions. *Note:* *If the flight crew enters a ZFW value that exceeds the acceptable range as defined in the performance data base, the “ENTRY OUT OF RANGE” message appears and the value is rejected.*
[2R] BLOCK	The block fuel in this field is a mandatory entry. When the flight crew enters a block fuel, the page title changes to INIT FUEL PREDICTION.

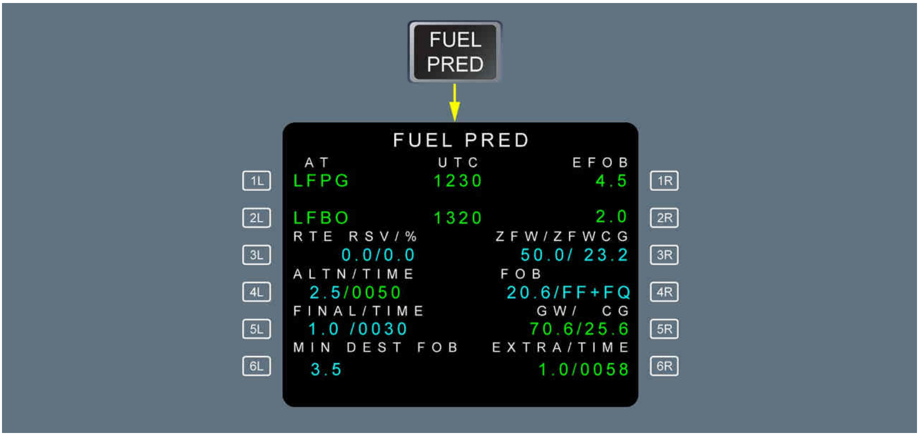
[3R] FUEL PLANNING (amber)	Initiates an FMGC block fuel computation using current hypothesis and extra = 0. When the pilot selects this function, FUEL PLANNING becomes green, and the BLOCK field is dashed during FMGC computation. The title of the page changes to INIT FUEL PLANNING, and BLOCK CONFIRM* replaces the FUEL PLANNING prompt, when the block fuel is computed by the FMGC. If the pilot modifies the parameters used to compute prediction before confirmation, the computation automatically restarts and FUEL PLANNING is displayed in green.
[4R] TOW/LW (green)	Displays the computed Takeoff Weight (TOW) and Landing Weight (LW) at the primary destination. This cannot be modified.
[5R] TRIP WIND (blue)	This field allows the entry of a mean wind component for the trip from the origin to the destination. Upon entry of a CO RTE or FROM/TO pair, this field defaults to HD 000 in small font. An entry preceeded by –, H, HD is considered to be headwind, +, T, TL to be tailwind. The entered speed is displayed in large blue font. When the flight crew inserts a wind on the CLIMB, CRUISE or DESCENT WIND page or on the PERF APP page, the system no longer considers the trip wind, and the corresponding field is dashed.
[6R] EXTRA/TIME (green)	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = BLOCK – (TAXI + TRIP + RSV + MIN DEST FOB). The field displays its information in small font, and it cannot be modified by the flight crew.

FUEL PREDICTION PAGE

Ident.: DSC-22_20-50-10-28-00000825.0022001 / 10 MAY 21
Applicable to: MSN 04827-04860

The FUEL PRED page displays fuel prediction information at destination and alternate, as well as fuel management data after the engines are started. The flight crew accesses the FUEL PRED page, by pressing the FUEL PRED key on the MCDU.

Note: *The flight crew can also call up this page by pressing the "→" key on the MCDU when on the INIT A page.*



```
          FUEL PRED
 AT          UTC        EFOB
LFPG         1230        4.5

RTE RSV/%            ZFW/ZFWCG
   0.0/0.0           50.0/ 23.2
ALTN/TIME               FOB
 2.5/0050           20.6/FF+FQ
FINAL/TIME            GW/   CG
 1.0 /0030           70.6/25.6
MIN DEST FOB       EXTRA/TIME
 3.5                  1.0/0058
```

[1L] - [1R] AT-UTC-TIME/EFOB	Display time and fuel predictions to the primary destination. TIME is displayed before takeoff. UTC predictions are displayed after takeoff. If the flight crew has entered ETT, the UTC is displayed. The EFOB at destination will turn to amber, if it becomes less than the MIN DEST FOB value.
[2L] - [2R] AT-UTC/TIME-EFOB	Display time and fuel predictions to the alternate airport (*Refer to DSC-22_20-30-10-18 Alternate Function - General*).
[3L] RTE RSV/%	Before departure, this field displays the route reserve fuel and the corresponding percentage of trip fuel. It may be equal to 0.0, if such is the policy of the operator. The flight crew can enter either a fuel quantity or a percentage. After takeoff, it is dashed, and the corresponding fuel is added to the EXTRA fuel.
[4L] ALTN/TIME	Displays alternate trip fuel and time, assuming that the cost index is equal to 0 and that the aircraft flies at the default cruise flight level. *Refer to DSC-22_20-30-10-18 Alternate Function - Review and Selection of Alternate Airport*. The flight crew can modify the alternate fuel as required. In this case, alternate time will be dashed.

[5L] FINAL/TIME	Displays the final reserve fuel and time calculated at the alternate airport (or destination airport, if selected in the “airline fuel policy” section of the AMI). The flight crew may enter a final fuel or time, and the system will compute associated holding time/fuel available. The system assumes a holding pattern at 1 500 ft AGL, with the aircraft in CONF1 at maximum endurance speed (racetrack pattern, altitude and selected airport can be modified through the “airline fuel policy” section of the AMI).
[6L] MIN DEST FOB	Displays the expected minimum fuel at destination. It is equal to the FINAL + ALTN fuel. The field can be modified directly by the flight crew, and is also impacted by the modification of the ALTN and/or the FINAL fuel.
[3R] ZFW/ZFWCG	Displays the ZFW and ZFWCG values, as entered before engine start on the INIT B page. The flight crew can re-enter or modify these values after engine start on the FUEL PRED page. If at engine start, no ZFW or ZFWCG values have been entered, amber boxes are displayed in the corresponding field. The flight crew must enter the ZFW/ZFWCG values to obtain a speed profile and predictions.
[4R] FOB	Displays the FOB calculated by the FMGS and/or the following fuel sensors: - Fuel flow and fuel quantity sensors (/FF+FQ) - Fuel flow sensors only (/FF) - Fuel quantity sensors only (/FQ). The flight crew can modify the FOB value in flight, or modify the sensors used by entering “/FF”, “/FQ” or “/FF+FQ”, as required.
[5R] GW/CG	The FMS continuously updates the GW and CG during the flight. The field displays dashes, as long as the system is not calculating the FOB, or ZFW has not been entered by the flight crew. If after engine start ZFW and FOB are defined but GW/CG cannot be computed (ZFWCG missing), 25 % is used as a default value; INITIALIZE WEIGHTS message is triggered on MCDU scratchpad and the flight crew must enter ZFWCG in [3R]. The field cannot be modified.
[6R] EXTRA/TIME	Displays the amount of extra fuel, and the resulting time available for holding over the primary destination. EXTRA FUEL = FOB - (TAXI + TRIP + RSV + MIN DEST FOB). This field cannot be modified.

Note: All fields are dashed before engines are started.

FLIGHT PLAN PAGES

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-A-00000826.0001001 / 16 MAR 11

These pages display all active and alternate flight plan, waypoints alongwith the associated predictions.

The flight crew can make all revisions to the lateral and vertical flight plans from these pages:

The flight crew presses the left key to revise the lateral flight plan, and the right key to revise the vertical flight plan.

The flight crew presses the F-PLN key on the MCDU console to access page A of the active flight plan.

Ident.: DSC-22_20-50-10-28-A-00000827.0009001 / 06 AUG 19

FLIGHT PLAN A PAGE

Flight Plan A Page displays time, speed, and altitude predictions for each active flight plan waypoint.

NAV ACCUR UPGRAD

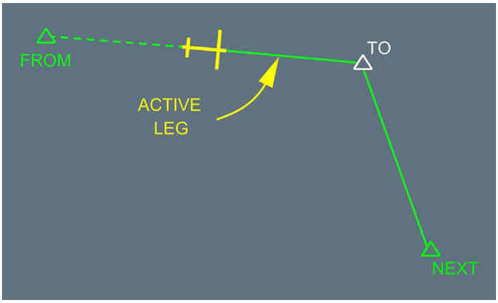
TITLE	FLIGHT NUMBER (blank, if no flight number has been entered). This line may display OFST in white, if a lateral offset is flown.
Line 1 to Line 5 WPT, UTC, SPD, ALT	These lines display consecutive waypoints, alongwith associated predictions of time, speed or Mach and altitude for each. TIME is displayed before takeoff, and UTC after takeoff. After the flight crew enters an Estimated Takeoff Time (ETT), UTC is displayed. The time and flight level display at the FROM waypoint (first line of the flight plan) are values that the system memorized at waypoint sequencing.
[1R] SPD/ALT	The field dedicated to SPEED or MACH is blank at the FROM waypoint, except at the departure airport (V1 associated with runway elevation, is displayed).

Note: *When the HOLD marker is slewed, the HOLD SPD label will overwrite the TIME/UTC title. In addition, the IMM EXIT or RESUME HOLD prompt will replace the SPD/ALT field.*

Note: *The predicted altitude at a waypoint is related to the QNH below the transition altitude, and is given as a flight level above the transition altitude.*

Line 6, DEST UTC/TIME DIST, EFOB	DIST is the distance to destination along the displayed flight plan. EFOB is the estimated fuel on board at destination. The EFOB at destination will turn to amber, if it becomes less than the MIN DEST FOB value. The sixth line is permanent and is displayed in white font, once predictions are available, except when a TMPY F-PLN is displayed, or in some cases when an ALT CSTR is entered ("← CLB or DES →" prompt appears).

The generic flight plan page displays the FROM waypoint (last waypoint to be overflown) on the first line, and the TO waypoint (in white) on the second line. The FROM/TO flight plan leg is called the active leg.



The flight crew can use the scroll keys to review all flight plan legs down to the last point of the alternate flight plan. The AIRPORT key serves as a fast scroll key. The flight crew can press it to call up the next airport (DEST, ALTN, ORIGIN) to be displayed on the flight plan page.

In order to return to the beginning of the flight plan page, the flight crew presses the F-PLN key on the MCDU console.

The display shows the name of the leg between two waypoints, and the distance between them on a line between the lines that identify them. During an approach, this in-between line also defines the angle of the final descent path. For example, "2-3 °" indicates that the leg is two nautical miles long, and the flight path angle is -3 °.

The display shows the bearing between FROM and TO waypoints as the bearing from the aircraft position to the TO waypoint. It shows track (TRK) between the waypoints shown in lines 2 and 3. This is the outbound track of the next leg.

If the database contains a published missed approach procedure, or if someone has inserted one manually, the display shows it in blue after the destination runway identification. It turns green when the go-around phase becomes active.
After the last waypoint of the missed approach, the display shows the alternate flight plan.
When NAV mode is engaged, the flight crew can only clear or modify the TO waypoint by using the DIR key on the MCDU console.

PREDICTIONS

The FMS calculates and displays predictions at all F-PLN waypoints.
It uses the current wind and the predicted winds to compute the predictions.

CONSTRAINTS

The database may define an altitude or speed constraint for each waypoint of the climb, descent, and approach phases, or the flight crew may manually insert such constraints (except at origin, destination, FROM, and pseudo-waypoints) or a time constraint (RTA).
The constraints are displayed in magenta, as long as predictions are not completed.
Once predictions are available, constraints are replaced by speed, time and altitude predictions, preceded by stars. If the star is in magenta, the system predicts that the aircraft will match the constraint (altitude within 250 ft, speed not more than 10 kt above the constraints, RTA within the required accuracy). If the star is in amber, the system predicts that the aircraft will miss the constraint and the MCDU displays: SPD ERROR AT WPTXX for speed constraint, or RTA MISSED AT XXX for time constraint.

Note: *SPD and ALT CSTR may either be entered on the VERT REV page or directly on the F-PLN A page, whereas TIME CSTR may only be entered from the RTA page.*

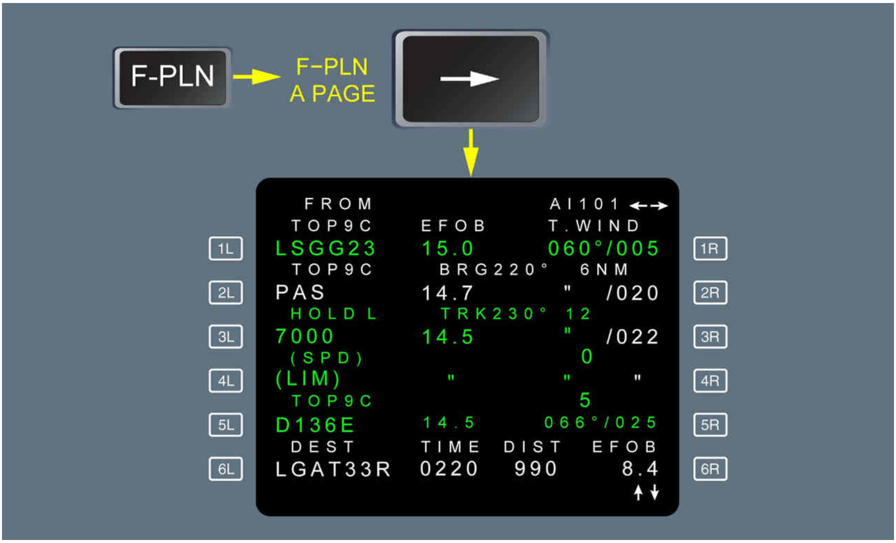
PSEUDO-WAYPOINTS

Pseudo-waypoints are geographical positions corresponding to an event in the flight plan : T/C (Top of Climb), T/D (Top of Descent), SPD/LIM (Speed Limit), S/C (Step Climb point), S/D (Step Descent point), DECEL (Deceleration for Approach), Time Markers etc.
Pseudo-waypoints are displayed as waypoints in parentheses.

Ident.: DSC-22_20-50-10-28-A-00000828.0001001 / 28 MAY 20

FLIGHT PLAN B PAGE

This page displays fuel predictions and forecast winds at each waypoint.
The flight crew calls it up by pressing the ″→” or “←” keys when the FLIGHT PLAN A page is displayed.



```

TITLE	FLIGHT NUMBER (blank, if no flight number has been entered).
Line 1 to Line 5 WPT-EFOB-WIND	These lines display consecutive waypoints and associated fuel predictions, and the predicted wind profile. The direction of forecast winds is relative to true north. Forecast winds include winds entered by the flight crew (large font) and the propagated winds at intermediate waypoints (small font). EFOB and WIND at the FROM waypoint are displayed in large font. At other waypoints, it is displayed in small font, and in the same color as the associated waypoint. No wind entry is allowed on this page. The flight crew will use the CLIMB, CRUISE, or DESCENT WIND pages, accessed from the INIT A page or the DATA INDEX B page.
Line 6 DEST-UTC/DIST-EFOB	Identical to the F-PLN A page.

LATERAL REVISION PAGES

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-B-00000829.0021001 / 14 MAY 12

These pages provide a list of the lateral flight plan revisions, that can be used to change the flight plan beyond a selected waypoint.

The crew calls up these pages from the flight plan pages (A or B), by pressing the left key next to the selected waypoint.

Different lateral flight plan revisions are available for different waypoints.

TITLE	The ident of the waypoint or airport selected for revision, alongwith its latitude and longitude. If the selected waypoint is the FROM waypoint, the title omits the aircraft latitude and longitude, and instead displays the "PPOS" (present position) instead.
[1L] DEPARTURE	This prompt gives access to the DEPARTURE pages, where the crew can select and insert runways, SIDs, and TRANSs.
[2L] OFFSET [ ]	This prompt allows the pilot to enter a left or right lateral offset in the flight plan. The offset can be between 1 and 50 NM. When the pilot enters an offset, the OFFSET field becomes yellow, and the 6L and 6R fields display "ERASE" and "INSERT". The pilot can delete an inserted offset by pressing the CLR pb, by entering a zero for the amount of the offset, or by selecting a DIR TO.
[3L] HOLD or [3L] ALTN	HOLD prompt gives access to the hold pages. ALTN prompt is only available if the revised point is the destination airport. It enables the pilot to access the alternate airport page.

[4L] ENABLE ALTN	The crew presses this key to create a temporary flight plan using the alternate flight plan that is defined, but not inserted. This prompt is not displayed at the ORIGIN and FROM waypoints.
[6L] TMPY F-PLN (yellow) or RETURN (white)	Pressing this key gives access to the temporary flight plan (when created). (No temporary flight plan exists). This prompt gives access to the last displayed page.
[1R] ARRIVAL or FIX INFO	ARRIVAL prompt calls up the arrival pages, where APPR, STAR, TRANS and VIA can be selected. FIX INFO prompt gives access to the FIX INFO pages. This prompt is only displayed on the lateral revision at the origin (before take off) or FROM (after take off), and at waypoints of the primary flight plan (except destination).
[2R] LL XING/INCR/NO (blue)	This field allows the crew to create latitude/longitude crossing points. The increment (INCR) ranges from 1 to 20 °, and the number of crossing points (from 1 to 99). This field is in yellow when a temporary flight plan exists and is not displayed for waypoints belonging to the descent procedure.
[3R] NEXT WPT (blue)	The crew presses this key to enter the content of the scratchpad as next waypoint. This prompt is not displayed at the FROM (or PPOS) waypoint. This field is in yellow when a temporary flight plan exists.
[4R] NEW DEST (blue)	The system displays this prompt for the flight crew to enter a new destination. It is not displayed at the FROM (or PPOS) waypoint, at waypoints beyond the destination, or at destination. When the missed approach becomes active, the prompt is available at any point of the missed approach. This field is in yellow when a temporary flight plan exists.
[5R] AIRWAYS	The crew presses this key to insert an airway starting at the revised waypoint and another waypoint. This prompt is not displayed at the FROM waypoint, origin or destination, and on manually-created waypoints.
[6R] TMPY INSERT*	Activates the temporary flight plan.

Ident.: DSC-22_20-50-10-28-B-00000830.0002001 / 14 MAY 12

TEMPORARY REVISION

When the pilot selects a lateral or vertical revision, the system creates a “Temporary F-PLN” and displays it in yellow on the MCDU (except Missed approach and Alternate parts that are dispalyed in blue) and as a dashed yellow line on the ND to enable the pilot to review the data before inserting. As long as the temporary flight plan is not inserted, the previous flight plan remains active and the system guides the aircraft along. The pilot can perform multiple revisions in the same temporary flight plan.

The temporary flight plan does not display destination information on 6L, but displays fields to erase or insert the temporary revision:
- UNDO/THEN ERASE: Cancels the last revision in the temporary flight plan.
- TMPY INSERT: Activates the entire temporary flight plan with all the revisions included.
- TMPY ERASE: Deletes the entire temporary flight plan.

Typical temporary F-PLN A page after after several revisions

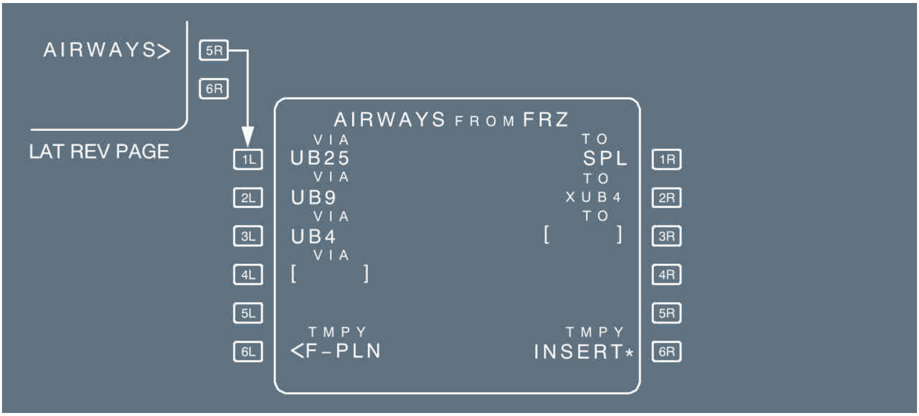
Note: *The destination information is still available by scrolling up to the end of the flight plan or by using the AIRPORT key.*

AIRWAYS PAGE

Ident.: DSC-22_20-50-10-28-00000831.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

The flight crew can use the AIRWAYS page to select up to five airways, and string them into the flight plan, after the revised waypoint.

The crew calls up this page, by pressing the AIRWAYS key (5R) on the LAT REV page.



TITLE	“AIRWAYS from XXX”, XXX: Revised waypoint ident (large green font).
[1L] to [5L] VIA	Displays the airways entered by the crew.
[6L] TMPY F-PLN or RETURN	The flight crew presses this key to return to the lateral revision page. This field displays “TMPY F-PLN” when a temporary flight plan is created. It enables the temporary flight plan to be consulted.
[1R] to [5R] TO	Displays the end point of the corresponding airways entered on the [1L] to [5L] entries. The ending point is displayed in large blue font, if manually-entered, in small blue font, if computed by the FMGC.
[6R] TMPY INSERT*	Activates the temporary flight plan.

Note: 1. *If the entered airway contains at least one fixed radius transition waypoint as defined in the navigation database, and the TO waypoint is defined, and the fixed radius transition waypoint is in the flight plan, then, “FIXED TURN RADIUS AWY” is displayed between the VIA and TO fields.*
2. *If the condition for display “FIXED TURN RADIUS AWY” is satisfied for two consecutives airways lines, the second line displays (“) instead of the whole message.*

DEPARTURE PAGES

Ident.: DSC-22_20-50-10-28-00000832.0004001 / 01 OCT 12
Applicable to: MSN 04827-04860

The flight crew can use the DEPARTURE pages to review departure procedures (RWY, SID, TRANS), and enter them into the temporary flight plan.

When the display shows the lateral revision page for the origin, the flight crew calls it up by pressing the 1L key.

The RWY, and, SIDS/enroute TRANS (if any) pages are available.

The flight crew sequentially calls up the SIDs and TRANS (if any) pages by selecting a runway on the RWY page. The flight crew can also scroll between the RWY, SIDs and TRANS (if any) pages by pressing the "←" or "→" key on the MCDU console.

Typical departure page after procedure insertion

(in yellow)

Line 1 RWY, SID TRANS	This line displays the RWY, SID, and TRANS in green after they have been inserted into the active flight plan, or in yellow if a temporary is created or updated. If nothing has been selected or inserted, the line displays dashes. “NONE” is displayed in the SID or TRANS field, if no SID or TRANS exists, or NO SID or NO TRANS was selected by the crew.
[2L] to [5L] RWY/SIDs	These fields display selectable and selected RWYs or SIDs. The pilot can scroll each list. Selectable RWYs and SIDs are displayed in blue with an arrow. Once a RWY or SID is selected, the arrow disappears. A RWY or SID, already inserted in the flight plan, is displayed in green. When a runway is selected, a temporary is created or modified, and the DEPARTURE page 2 for SID selection is automatically displayed. The display shows the length, course and, if available, the MLS ident and frequency for each runway.
[6L] TMPY F-PLN or RETURN	The pilot presses this key to return to the temporary flight plan page, if a temporary exists. The display shows RETURN, instead TMPY F-PLN, when the pilot has not created a temporary flight plan. Pressing this key reverts to the LAT REV page.
[2R] to [5R] TRANS	This field displays the selectable and selected enroute transitions in blue and green respectively. They are blank, if there are no transitions. When a TRANS is selected, a temporary is created or updated (if one already exists).
[6M] EOSID	Once a runway is inserted into the flight plan, this field displays any ENG OUT SID for that runway. If a temporary is created or updated, the EOSID is displayed in yellow. Otherwise, it is displayed in green. If there is none, it displays “NONE”.

[6R] TMPY INSERT*	Activates the temporary flight plan.

HOLD PAGES

Ident.: DSC-22_20-50-10-28-00000833.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

These pages allow the pilot to review and modify the holding pattern parameters at the selected revise waypoint
The pilot calls up these pages by pressing the HOLD key on the LAT REV page for the waypoint.
The flight crew can insert database holds, hold computed by the FMS, or manually defined holds.

The page title is displayed in white, if no temporary flight plan exists, or in yellow if a temporary flight plan is in progress. Hold parameters are displayed in blue if no Temporary exists, or in yellow if a temporary flight plan is in progress.

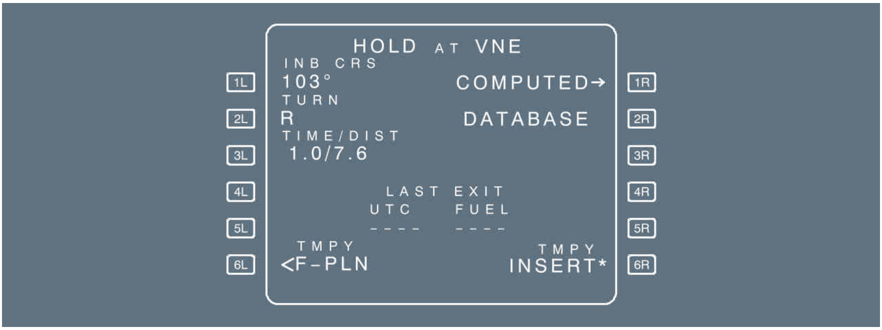
At first access, the HOLD page is displayed as follows:

- If a database hold is available at that waypoint, [1L], [2L] and [3L] display in yellow the parameters of the FMS database hold.
  In [2R], DATABASE is displayed in yellow. If any hold parameter is modified, DATABASE is displayed in white with a white arrow.
  In [1R], COMPUTED is displayed in white with a white arrow.
- If no database hold is available at that waypoint, [1L], [2L] and [3L] display in yellow the parameters of the FMS computed hold
  In [1R], COMPUTED is displayed in yellow. If any hold parameter is modified, COMPUTED is displayed in white with a white arrow.

When the HOLD has been inserted, [1L], [2L] and [3L] display in blue the parameters of the already-existing hold.

- If the already-existing hold is a computed hold, COMPUTED is displayed in blue in [1R].
- If the already-existing hold is a database hold, DATABASE is displayed in blue in [2R].
- If the already-existing hold is neither a computed hold nor a database hold, both COMPUTED and DATABASE are displayed in white with a white arrow.

- **Database Hold**
  If a hold is defined in the navigation database for the revised waypoint and can be inserted then the corresponding TMPY F-PLN is automatically created by the FMS and DATABASE is displayed in yellow.



- **Computed Hold**
  If a default hold is computed by the FMS and can be inserted then the corresponding TMPY F-PLN is automatically created by the FMS and COMPUTED is displayed in yellow.

      TMPY                 TMPY
6L   <F-PLN              INSERT*  6R
```

[1L] INB CRS	This field displays the inbound course of the holding pattern. The data may be manually or automatically modified (via COMPUTED or DATABASE prompts).
[2L] TURN	This field shows the direction to turn in the hold (L or R). The data may be modified.

[3L] TIME/DIST	This field shows the time and distance for the outbound leg. The data may be modified, but time and distance cannot be entered simultaneously. Time and distance are dependent values that the system calculates from the predicted ground speed at the revised point, which in turn depends upon the holding speed (speed for maximum endurance, ICAO speed limit, or constraint speed, whichever is lower).
[6L] TMPY F-PLN or RETURN	This prompt gives access to the temporary flight plan page if one is in progress. If not, “RETURN” is displayed and allows a return to the LAT REV page.
[1R] COMPUTED (→)	Pressing this key reverts parameters to the system-computed parameters (1L, 2L, 3L).
[2R] DATABASE (→)	Pressing this key reverts the displayed parameters to the parameters memorized in the database for this waypoint.
LAST EXIT UTC FUEL	This field displays the time at which the aircraft must leave the holding pattern in order to meet fuel policy criteria (extra fuel = 0). The system also displays the estimated fuel on board at that time in thousands of kg or lb.

The 1R and 2R fields, as well as the hold parameters (1L, 2L, 3L), are blue when no temporary flight plan exists, and yellow when a temporary flight plan is in progress.

[6R] TMPY INSERT*	Activates the temporary flight plan.

DIRECT TO PAGE

Ident.: DSC-22_20-50-10-28-00000834.0004001 / 01 OCT 12
Applicable to: MSN 04827-04860

Pressing the “DIR” key from the MCDU screen calls up the DIR TO page. The pilot presses it to modify the flight plan, by creating a direct leg from the aircraft’s present position to any selected waypoint. The pilot cannot call up this page when the aircraft's present position is invalid. The “A/C POSITION INVALID” message is then displayed.
These are four DIRECT TO/INTERCEPT functions: DIRECT TO, ABEAM PTS, RADIAL IN, RADIAL OUT.
Using the DIRECT TO function results in the creation of a DIR TO temporary flight plan. This DIR TO temporary flight plan only reflects the insertion of the direct leg in the active flight plan. Moreover, a DIR TO temporary flight plan and a multi-revision flight plan cannot exist at the same time.

DIR TO F-PLN A page (after direct to a F-PLN waypoint with abeam points)

F-PLN A page after insertion from the previous page

[1L] WAYPOINT	This field gives access to the 'Direct TO' fix waypoint to be selected from a list of waypoints. The 'Direct TO' waypoint may be entered by using its identifier, place/bearing/distance, place-bearing/ place-bearing or latitude/longitude.
[2L] to [5L] F-PLN WPTS	This list provides the waypoints of the active flight plan, except waypoints from the missed approach, pseudo-waypoints F-PLN markers, non fixed waypoints. The display may be scrolled ↑ ↓
[6L] DIR TO ERASE	Pressing this key deletes the DIR TO temporary F-PLN.
[1R] UTC/DIST	As soon as the DIR TO temporary F-PLN is created, the time and distance to the 'Direct TO' fix waypoint is displayed in yellow.
[2R] DIRECT TO	Selecting this key activates the DIRECT TO function in the DIR TO temporary F-PLN.
[3R] ABEAM PTS	Selecting this key activates the ABEAM PTS function in the DIR TO temporary F-PLN.

[4R] RADIAL IN and [5R] RADIAL OUT	The pilot fills in these fields to define a radial associated to the waypoint. Selecting a radial in (out) will activate the intercept radial into (from) the specified waypoint in the DIR TO temporary F-PLN. The pilot enters the radial in, or radial out, as XXX, XXX being the radial. An M or T may also be entered, referring to a MAG or a True value. A default radial in is proposed by the FMS if the DIR TO waypoint is part of the F-PLN.
[6R] DIR TO INSERT	Pressing this key enables the DIR TO temporary F-PLN to be inserted. After insertion, the F-PLN A page is displayed.

```

If the DIR TO/INTCPT WPT entry is to a waypoint already in the flight plan, a default RADIAL IN is displayed in small font. However, no radial is displayed on the ND for this default radial. No default radial is provided for the RADIAL OUT field.

Selecting the INTCPT TO (RADIAL IN [1R]) function:
- Activates the intercept radial IN TO the WPT in the temporary F-PLN.
- Sets the course = radial IN + 180 °.

Selecting the INTCPT FROM (RADIAL OUT [2R]) function:
- Activates the intercept radial OUT from the WPT.
- Sets the course = radial OUT.

For details: *Refer to DSC-22_20-30-10-18 DIR Key (DIRECT-TO-FUNCTION) - General*.

ARRIVAL PAGES

Ident.: DSC-22_20-50-10-28-00000835.0025001 / 17 MAY 21
Applicable to: MSN 04827-04860

These pages enable the pilot to select a runway with its associated final, and to review arrival procedures (approaches, VIAs, STARs, TRANS) and enter them into the active flight plan.
The pilot calls them up from the LAT REV page for the destination.
Three lists APPR, STAR, and TRANS are available, along with a fourth, APPROACH VIAS if there are any transitions.
The pilot sequentially calls up each page, either by selecting a data item (such as APPR) or by pressing the "→" or "←" keys on the MCDU console.
When an approach is selected, it is inserted in a temporary fight plan and the ARRIVAL page 2 or APPROACH VIA page is automatically displayed.

Line [1L]-[1R] [2R]	This line displays the APPR, VIA, STAR, and TRANS in green, if they have been inserted in the flight plan, and in yellow, as a temporary flight plan, if they have been selected but not yet inserted. It displays dashes or "NONE", if nothing has been selected or inserted.
[2L] APPR VIAS	The pilot presses this key to call up transitions from the last point of the STAR to the first point of the approach.
[3L] to [5L]	These fields list selectable and selected APPRs, STARs, and VIAs. The flight crew can scroll the pages, when necessary. Selectable APPRs, STARs, and VIAs are displayed in blue with an arrow. Once the pilot has selected an APPR, STAR, or VIA, a temporary F-PLN is created. After the APPR, STAR, or VIA is inserted into the flight plan, it is displayed in green. For each approach, the display shows runway length, heading, and the frequency and identifier of the ILS when ILS is available. In case there are multiple approaches for the same runway, the ILS is identified with the runway plus the multiple indicator (i.e. ILS33L-S)
[6L] TMPY F-PLN or RETURN	TMPY F-PLN is displayed to access the temporary F-PLN page corresponding to the last revision. The field displays “RETURN”, instead of TMPY F-PLN, when the flight crew has not created a temporary flight plan.
[3R] to [5R]	These fields either display: - The identifier and the frequency of the NAVAID specified for the approach, or - The enroute transitions compatible with the selected STAR. The active selected TRANS is in green, the remaining TRANS are in blue.

ALTERNATE PAGE

Ident.: DSC-22_20-50-10-28-00000836.0002001 / 03 NOV 21

Applicable to: MSN 04827-04860

This page enables the flight crew to review, in the NAV database, the alternate airports that are paired with the destination, and define additional alternates, if needed. The flight crew calls up this page with the ALTN prompt, from the lateral revision page for the destination.

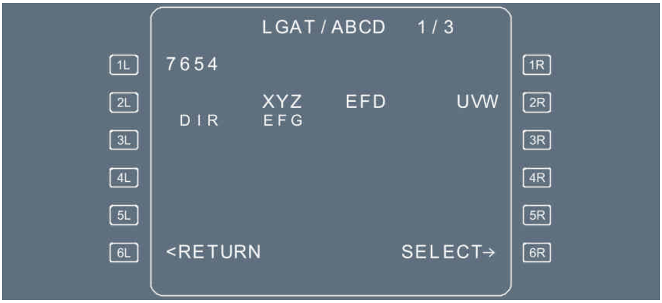
TITLE	The destination airport is displayed in large green font.
[1L] ALTN	This field displays the selected alternate: In green, if it is active; in yellow, if it is temporary. “NONE” is displayed, if NO ALTN option is selected, or if the destination has no alternate.
Line 2 to line 5	These lines display the identifications of alternates (up to 6), the extra fuel weight remaining after landing at the alternates, and the great-circle track and distances to them from the destination. If the database contains a company route between the destination and the alternate, the distance shown is an airway distance, not a great-circle distance. When the database defines a preferred alternate, it is displayed on Line 2 (if no scrolling has been performed).

[4L] OTHER ALTN	The flight crew can enter an airport identifier in the brackets (Line 3). If that airport is not stored in the database, the NEW RUNWAY page appears for the flight crew to use in defining it. If it is stored in the database, the ROUTE SELECTION page appears, and the flight crew can use it to select the best route. The flight crew may enter a distance in the DIST field of the OTHER ALTN prompt, in order to get preliminary fuel predictions. However, once the flight crew has selected the alternate airfield as a temporary alternate and then inserted it, the ALTN distance either reverts to the airway distance, if the flight crew has selected a company route, or to the direct distance to the alternate. The flight crew can use OTHER ALTN to overwrite and replace the previous OTHER ALTN.
NO ALTN	The flight crew uses this key to select the NO ALTN option.
[6L] RETURN or THPY F-PLN	The flight crew presses this key to revert the display to the LAT REV page. Pressing this key gives access to the TMPY F-PLN page corresponding to the last revised item.
[1R] CO RTE	Pressing this key displays the active company route between the destination and the selected alternate.
[6R] TMPY INSERT*	Activates the temporary flight plan.

ROUTE SELECTION PAGE FOR ALTERNATE

Ident.: DSC-22_20-50-10-28-00000837.0002001 / 05 JUN 18
Applicable to: MSN 04827-04860

This page enables the pilot to review the company route between the destination and the alternate, and to select a different route, if that seems appropriate.
This page comes up automatically, when the flight crew enters an ident in the OTHER ALTN field and if a route is stored in the Navigation database for this ALTN.



```
         LGAT/ABCD    1/3
7654
           XYZ    EFD        UVW
  DIR      EFG

<RETURN               SELECT→
```

[6R] SELECT	Pressing this key reverts the display to the alternate page. (The distance between the destination and the alternate is then the airway distance).

VERTICAL REVISION PAGES

Ident.: DSC-22_20-50-10-28-00000838.0004001 / 16 MAR 11

Applicable to: MSN 04827-04860

These pages contain the menu of available vertical flight plan revisions that can be applied at a selected waypoint.
The crew calls up these pages from the flight plan A or B pages by pressing the right-hand key next to the selected revised waypoint.
The crew may make several different vertical revisions although some may not be available at all waypoints.

VERT REV AT ORIGIN

VERT REV AT CRUISE WPT

VERT REV AT WPT IN CLIMB. (ALT CSTR ENTERED AND PREDICTED MISSED)

VERT REV AT DEST

VERT REV AT WPT (PREDICTIONS NOT AVAILABLE)

TITLE (white)	"VERT REV AT [location]" The second line shows the remaining fuel and the extra fuel at the waypoint being revised.
[1L] "TOO STEEP PATH BEYOND" (amber)	Is displayed, if the waypoint is part of a leg with a descent path too steep.

[2L] CLB/DES SPD LIM (magenta)	Displays the speed limit applicable to the climb or descent phase. It is in large font when entered manually, and in small font when it comes from the database.
[3L] SPD CSTR (magenta)	This field displays any speed constraint assigned to the revised waypoint. It is in large font when entered manually, and in small font when it comes from the database. It is in yellow when a temporary flight plan exits.
[4L] CONSTANT MACH	This prompt provides access to the CONSTANT MACH page.
[5L] WIND DATA (white)	This prompt is only displayed for climb, cruise and descent waypoints, respectively giving access to the CLIMB, CRUISE and DESCENT WIND pages for wind data at the revised point.
[6L] RETURN or TMPY F-PLN or ← CLB	The pilot presses this key to return to the last displayed flight plan page. When a temporary flight plan exists, the TMPY F-PLN prompt appears and provides access to this page. When "← CLB" displayed, pressing this key assigns the constraint to CLB phase and inserts it into the vertical flight plan.
[2R] RTA	This prompt provides access to the Required Time Arrival (RTA) page. It is not displayed when the VERT REV page is accessed from the alternate F-PLN.
[3R] ALT CSTR (magenta)	This field displays the altitude constraint assigned to this revised waypoint. It is in large font when the constraint is manually-entered, and in small font when it comes from the database. A CLR action reverts it to brackets. The constraint may be: • "At", entered as XXXXX (Example: FL 180). • "At or above", entered as + XXXXX or XXXXX + (Example: FL +310). • "At or below", entered as – XXXXX or XXXXX – (Example: -5 000). • A "window" constraint. The altitude window consists of two altitudes within which the aircraft should fly. The crew cannot manually enter a "window" constraint. It is in yellow when a temporary flight plan exists.
G/S INTCP (green)	This field displays the glide intercept altitude for an ILS approach on the vertical revision page at destination. It cannot be modified by the pilot.

[4R] ALT ERROR (green)	When the aircraft misses a predicted altitude constraint, this field displays the difference between the altitude constraint and the predicted altitude. If, for example, “-500” appears in this field in green, the aircraft will reach the waypoint at an altitude 500 ft below the constraint altitude. This only applies to waypoints in the climb and descent phases.
[5R] STEP ALTS (white)	This legend appears for any waypoint, once a cruise altitude has been entered. It is not available in engine-out, descent, approach, and go-around phases. This gives the pilot access to the STEP ALTS page.
[6R] DES →	When this field displays “DES”, pressing this key assigns the constraints to the descent phase and inserts them into the vertical flight plan. (See note below).
TMPY INSERT *	Activates the temporary flight plan.

Note: *Altitude and speed constraints may apply to the climb, descent, or approach phase, but never to the cruise phase. The 6L/6R fields display “CLB/DES” when the revised waypoint is a cruise phase waypoint, and the FMGS needs to know if the new constraint is to be applied in climb or descent phase. The FMGS will modify the cruise phase accordingly. These 2 prompts also display “CLB/DES” when the predictions are not computed. (Top of climb and top of descent not yet defined).*

STEP ALTS PAGE

Ident.: DSC-22_20-50-10-28-00000839.0004001 / 14 MAY 12
Applicable to: MSN 04827-04860

This page enables the pilot to insert up to four geographic step points and one optimal step point into the flight plan. This page also displays the fuel/time savings associated with the optional step.
The crew calls it up from the vertical revision page.

Page filled in with one step, but not inserted

TITLE	STEP ALTS followed by the current cruise altitude.
[1L] – [1R] [4L] – [4R] ALT/WPT (blue)	The waypoint identifier, as well as the altitude to step, can be entered in this field. Both are displayed in large font. When an entry is made, a temporary F-PLN is created.

DIST/TIME (UTC) (small green font)	Displays the distance to go, and time from the present aircraft position, along the flight plan to the step point. *Note: The following messages may be displayed in the DIST/TIME field:* *- “ABOVE MAX”, if the step altitude exceeds the Max altitude.* *- “IGNORED”, if the end step point is less than 50 NM from the top of descent or if the step climb is located prior to the top of climb or after the top of descent.* *- “STEP AHEAD”, when the aircraft is within 20 NM of the start step point.* *- “NO OPTIMAL STEP” if the FMS is not able to compute an optimal step for the corresponding altitude.* *- "NO OPTIMAL” if an inserted optimal step is not optimal any longer.*
[5L] OPT STEP: ENTER ONLY ALT (white)	Is displayed to guide the crew for the entry format of an optimal step.
(OPT) FROZEN: RTA EXISTS	Is displayed, if a time constraint exists in the flight plan.
(OPT) TO FLXXX	This prompt allows the selection of the optimal step.
NO OPTIMAL STEP	Is displayed when the system cannot determine the optimal point for the corresponding altitude.
[6L] RETURN or TMPY F-PLN	The flight crew presses this key to return to the previous page. Appears when a temporary flight plan exists. It provides access to the temporary flight plan page.
[5R] ΔTIME/ΔFUEL (green)	Time and fuel savings represent the gain from selecting the optimal step: The difference in flight time and fuel consumption between the F-PLN without the optimal step selected and the F-PLN with the optimal step selected. It is displayed, when an optimal step has been computed. As soon as the optimum step is selected, the time/fuel savings information is no longer displayed.
[6R] TMPY INSERT *	Activates the temporary flight plan.

DATA INDEX PAGES

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-C-00000841.0002001 / 01 OCT 12

There are two INDEX pages:

The DATA INDEX 1/2 page gives access to various pages assigned to navigation.

The DATA INDEX 2/2 page lists the navigation data, entered in the FMGS.

The crew enters those items labeled “PILOTS” and can modify them. The crew can call up the others, but cannot modify them.

The crew calls up these pages by pressing the DATA key on the MCDU console:

WAYPOINT PAGE

- The pilot calls up this page by pressing the 1L key on the DATA INDEX page. It displays waypoint information associated with the identifier, which the flight crew inserts in the [1L] field.
- From this page, it is possible to call up any waypoint from the navigation database, or any waypoint not stored in the stored waypoint list, if they belong to the active, temporary, or secondary flight plan.

PILOTS' WAYPOINT PAGE

The pilot calls up this page by pressing the 1R key on the DATA INDEX page. It displays waypoints, defined and stored by the pilot. It lists each stored waypoint, along with a number that shows the relative order in which it was inserted in the database. This number is displayed in the upper right-hand corner of the page. For example, “1/20” indicates that the waypoint was the first of 20 stored.

[1L] IDENT	To delete a waypoint, the pilot clears the 1L IDENT display.
[2L] LAT/LONG	The waypoint latitude and longitude are displayed in this field.
[3L]	This field displays PLACE/BRG/DIST, or PLACE-BRG/ PLACE-BRG, or PLACE/DIST, depending on how the waypoint was defined.
[5R] NEW WAYPOINT	The pilot presses this key to call up the NEW WAYPOINT page.
[6R] DELETE ALL	The pilot presses this key and the label changes to an amber "CONFIRM DELETE ALL". Pressing this key a second time deletes all the waypoints stored by the flight crew, except those currently used in the active or secondary flight plan. (“PILOT ELEMENT RETAINED” appears on the MCDU).

NEW WAYPOINT PAGE

- The pilot displays this page by pressing the 5R key on the PILOTS' WAYPOINT page.
- The flight crew uses this page to define and store waypoints. The maximum number of waypoints that it is possible to enter depends on the FMS standard. The maximum number can be 20 or 99. This number appears in the upper right corner of the STORED WAYPOINT page. For example, "1/20" indicates that it is possible to store up to 20 waypoints. If an additional waypoint is entered, then the first one is deleted.

The flight crew defines a waypoint by entering its IDENT in the data field next to 1L, then by entering its position in the amber boxes.
The STORE prompt appears next to 6R when the boxes are filled in, and the pilot presses the key to store the waypoint in the database.

If the pilot enters the waypoint's position as place/bearing/distance, or place-bearing/place-bearing, the FMGC computes its latitude and longitude.

[2L] CLASS	This field identifies the NAVAID as VOR, DME, VOR DME, VORTAC, NDB, LOC, ILS, MLS, ILS/DME, MLS/DME, ILS/TAC or TACAN. It displays NON COLLOCATED, if the NAVAID is uncollocated.
[3L] LAT/LONG	If a uncollocated VOR DME or VORTAC is displayed, the LAT/LONG is the VOR latitude and longitude. The LAT/LONG displayed for an ILS, ILS DME, ILS TAC is the LAT/LONG of the localizer.
[4L] FREQ or CHAN	CHAN is displayed, if the class of NAVAID is an MLS or an MLS DME.
[5L] ELV	This field gives the NAVAID elevation in feet above sea level. It is not displayed for VOR or NDB.

[6L] FIG OF MERIT	This field shows how far out the FMGS can autotune a VOR, VOR/DME, VORTAC, or DME for display or for computing position. 0 : Up to 40 NM 1 : Up to 70 NM 2 : Up to 130 NM 3 : Up to 250 NM
[1R] STATION DEC or RWY IDENT	This is the magnetic declination in the NAVAID area (used only for VOR, VOR/DME, and VORTAC). The field displays RWY IDENT, if the NAVAID is a LOC, ILS, MLS, ILS/DME, MLS/DME or ILS/TAC.
[2R] CATEGORY	This field shows the NAVAID's category, if it is an ILS, ILS/DME, MLS, MLS/DME or ILS/TAC. A LOC DME has a category = 0.
[3R] COURSE	This is the localizer course, if the NAVAID is an ILS or a LOC, ILS TAC, ILS, MLS or MLS/DME.
[6R] RETURN	This prompt is displayed, if the page is accessed from the SELECTED NAVAID page. The pilot presses this key to return to the SELECTED NAVAID page.

PILOTS' NAVAID PAGE

The pilot calls up this page by pressing the 2R key on the DATA INDEX page. This page is used to display or delete defined and stored navaids.

FIG OF MERIT
2 (130NM) STORE→

It can be used to define and store up to 20 NAVAIDs. Entering an additional waypoint deletes the first one. The NAVAID elements must be entered in two steps:

1. Enter the data in the amber-boxed lines.
2. Enter frequency, elevation, figure of merit, and station declination or ILS category and course, if applicable.

Note: *The pilot cannot create an ILS/DME, MLS/DME, or ILS/TAC or an uncollocated NAVAID. If the runway associated with the ILS or MLS has been entered via the new runway page, the course, IDENT, and runway IDENT are already displayed on the new NAVAID page when it comes up (copied from the new runway page). For details: Refer to DSC-22_20-50-10-28 RUNWAYS/PILOTS' RUNWAYS/NEW RUNWAY Pages.*

[1R] STATION DEC	The pilot must enter the magnetic declination, if the prompt is displayed. This prompt is only displayed for VOR, VORTAC, or VOR/DME.
[3R] COURSE	If the NAVAID is an ILS, MLS, LOC, enter the course.
[6R] STORE	This prompt appears when all the amber boxes have been filled in. The pilot presses this key to store the NAVAID.

A stored NAVAID is never used for position computation.

NEW RUNWAY PAGE
(MANUALLY COMPLETED)

RUNWAY PAGE

This page displays the following information :

[1L] IDENT	The runway ident, which comprises the airport identification and the runway direction, uses six or seven digits (Example : CYYZ 24L and LFRJ 08).
[2L] LAT/LONG	The latitude and longitude of the runway threshold.
[4L] LENGTH	The runway length in meters (M) or feet (ft), in four digits (26 300 ft or 8 000 m).
[5L] ELV	The elevation of the threshold in feet above sea level.
[6L] CRS	The runway course (degrees magnetic).
[1R] LS IDENT	The LOC, ILS or MLS identifier.

PILOTS' RUNWAY PAGE

The pilot uses this page to display or delete the defined and stored runways. The stored runways are listed and numbered in the order in which they were inserted. The number is displayed in the upper right-hand corner of the page. (For example, 2/4 means the runway is the second of four stored runways).
The pilot can delete any stored runway from the database by displaying its ident in the 1L field, then by pressing the CLR key on the MCDU control panel.

[6R] DELETE ALL and CONFIRM DELETE ALL	The pilot presses this key to erase all the stored runways, except those used in the active or secondary flight plan. (The MCDU displays “PILOT ELEMENT RETAINED”).
[1L] to [6L]	These fields are similar to the RUNWAY page fields.

NEW RUNWAY PAGE

The pilot can use this page to define and store up to 10 runways.
When the pilot enters an ILS/LOC ident in the [1R] field, the new navaid page comes up. When the pilot has entered and stored the necessary data in the new navaid page, the new runway page reappears.

The new runway page and the new navaid page (ILS/LOC) are not independent :
- When the flight crew first defines the ILS/LOC (on the new navaid page), the new runway page, when called up, already displays the RWY course, RWY ident, and ILS ident (copied from the new navaid page).
- When the flight crew first defines the runway (on the new runway page), the new navaid page, when called up, already displays the ILS course, ILS ident, and runway ident.

The pilot must enter the two runway directions on two different new runway pages (Example: LFRJ 08 and LFRJ 26) to allow the flight plan to select either one.

Note: *When 10 runways are stored, entering a new stored runway deletes the first one of the list (1/10).*

[1L] to [6L]	These keys are used to enter information about the new runway.
[1R] LS IDENT	This key is used to enter the ILS/MLS/LOC ident. The NEW NAVAID page comes up.
[5R] RETURN	The pilot presses this key to return to the NEW NAVAID page.
[6R] STORE	This prompt only appears when all the amber boxes have been filled in.

Note: *The NEW RUNWAY may be used for departure or destination, but no SID or STAR can be associated or stored with this runway. Therefore, the pilot will use it as an “independent” airport.*
A new runway is identified by the 4–letter ICAO airport identifier, although all six or seven digits must be entered.

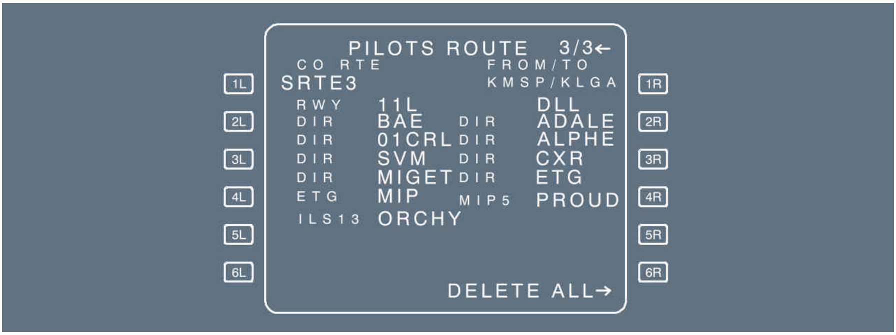
ROUTE PAGES

(Not-modifiable)

[1L] CO RTE	Any company route ident, entered in this field, causes all the elements of the route to be displayed.

Line 2 to Line 6	These lines display the various route elements, including waypoints and airways.
[1R] FROM/TO	This field is automatically filled in, when the pilot enters the ident for a company route. When the pilot manually enters a city pair, the MCDU displays “NOT IN DATA BASE”, if the city pair is not in the navigation database. If the city pair is in the database, the CO RTE field displays the first route stored in small blue font. If more than one route is stored, the pilot can scroll to see the different routes.

PILOTS' ROUTE PAGE



```
        PILOTS ROUTE   3/3←
  CO RTE            FROM/TO

```

This page displays up to 5 routes, stored by the pilot. The Pilots' routes are listed and numbered in the order of insertion. The number is displayed in the upper right-hand corner of the page.

[1L] CO RTE	This field identifies the stored route. Clearing this field deletes the stored route.
Line 2 to Line 5	The fields in these lines are identical to the corresponding fields on the route page.
[6L] NEW ROUTE	Pressing this key calls up the new route page.
[1R] FROM/TO	This identifies the city pair of the stored route.
[6R] DELETE ALL	Pressing this key changes the label "CONFIRM DELETE ALL" which appears in amber. Pressing this key a second time deletes all previously-stored routes.

NEW ROUTE PAGE

The pilot calls up this page by pressing the NEW ROUTE key on the PILOT'S ROUTE page. It can be used to store up to five new routes that have already been defined in the active or secondary flight plan.

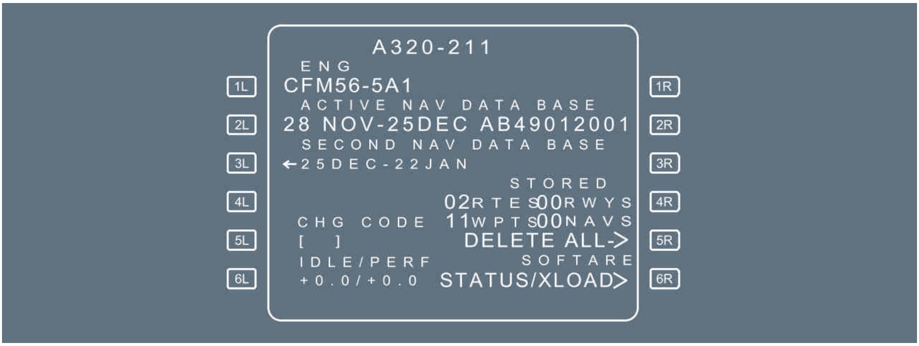
[1L] CO RTE	This field allows the pilot to enter a new company route ident. If that ident has already been assigned, the entry is rejected. The message NON UNIQUE ROUTE is then displayed.
[2L] STORE ACTIVE F-PLN (cyan)	Pressing this key stores parameters of the active flight plan as a new route. This prompt appears when the system contains a FROM/TO, but only during preflight.
[3L] STORE SECONDARY F-PLN (cyan)	Pressing this key stores parameters of the secondary flight plan as a new route. This prompt appears when the system contains a FROM/TO, and the secondary flight plan has not yet been sequenced.

Note:
- *If it has not already been named, a stored route is automatically named (SRTE 1 to SRTE 5) when stored.*
- *When 5 routes are already stored, the pilot cannot insert a new stored route. The “PILOTS' ROUTE FULL” message is displayed, and the pilot must manually delete a route, in order to be able to store a new one.*
- *The following flight plan elements are not retained when the route is stored :*
  - *Pilot-entered holds and constraints*
  - *Offset*
  - *Modifications to terminal procedures*
  - *Pseudo waypoints*
  - *Step at optimum*
  - *The MCDU then displays “REVISIONS NOT STORED”.*

AIRCRAFT STATUS PAGE

Ident.: DSC-22_20-50-10-28-00000848.0001001 / 24 SEP 14
Applicable to: MSN 04827-04860

The pilot call this page up by pressing the DATA key on the MCDU console.



```
           A320-211

 [   ]          DELETE ALL->
 IDLE/PERF           SOFTARE
 +0.0/+0.0     STATUS/XLOAD>
```

TITLE	AIRCRAFT TYPE
[1L] ENGINE TYPE	The system uses this engine model to calculate predictions.

Note: *When the same performance database is used for different aircraft configurations, the aircraft or engine type displayed in the [1L] field may differ from the actual aircraft.*

[2L] ACTIVE DATABASE	The validity period and part number are displayed in large font.
[3L] SECOND DATABASE	The validity period and part number are displayed in small font. The pilot can press the 3L key to switch to the second database as the active database.

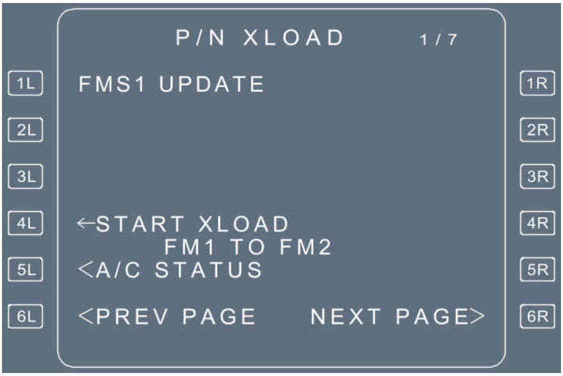
CAUTION	Cycling the database erases the primary and secondary flight plans, as well as the stored data. The flight crew must never do this in flight.

[5L] CHG CODE	This field allows entry of a code which permits modification of the IDLE and/or PERF factor displayed in 6L. It is displayed in the PREFLIGHT and DONE phases. The label is displayed in small white fonts; the brackets, or the entered value, are displayed in large blue fonts.
[6L] IDLE/PERF	It is only possible to modify these factors when the aircraft is on ground. If no value was entered, the FMS displays default values coded in the Airline Modifiable Information (AMI) file. Default values are displayed in small font, although manually entered values are displayed in large font. When it is necessary to modify the IDLE or the PERF factor: - ENTER the change code in the CHG CODE field [5L]. The default value for this code is “ARM” but it is possible to modify it on airline request (the applicable code is then coded in the Airline Modifiable Information (AMI) file). When a valid change code is entered, the IDLE and PERF factors are displayed in blue. - ENTER the new IDLE and/or PERF factor(s) in the scratchpad. - PRESS the [6L] key to insert the new IDLE and/or PERF factor(s). The new IDLE and/or PERF factor(s) is (are) displayed in large blue font.
[4R] STORED	This field displays pilot-stored data in a large green font. The field is blank, if no data is stored. (The airline can choose to have this data automatically erased at the done phase).
[5R] DELETE ALL	Pressing this key changes the label to "CONFIRM DELETE ALL" in amber. Pressing this key a second time deletes all pilot-stored data, except data that is part of the active and secondary flight plans.
[6R] STATUS/XLOAD	This prompt gives access to the P/N STATUS and P/N XLOAD pages.

P/N XLOAD PAGE

Ident.: DSC-22_20-50-10-28-00000849.0001001 / 10 DEC 09
Applicable to: MSN 04827-04860

This page allows the crossloading of all databases or configuration files' part numbers which are different between both sides. Crossloading from this page avoids reviewing each individual P/N STATUS page.



TITLE	P/N XLOAD
[1L]	FMS1 UPDATE : FMS1 can be loaded on the right side MCDU. FMS2 UPDATE : FMS2 can be loaded on the left side MCDU
[4L]	START XLOAD : This blue prompt is displayed, only if the system detects a difference between both sides' part numbers. FMS1/FMS2 IDENTICAL : Displayed in green, when there is no difference between both sides' part numbers.
Line 5	FM1 TO FM2 or FM2 TO FM1 : Indicates the crossloading direction.
[5L]	A/C STATUS : This white prompt is displayed, when there is no crossloading in progress. It gives access to the A/C STATUS page. MM : SS MIN REMAINING : Indicates the time remaining for crossload completion, when a crossload is in progress.
[6L] PREV PAGE	The pilot presses this key to return to the A/C STATUS page.
[6R] NEXT PAGE	Pressing this key calls up the next P/N XLOAD page.

TITLE	P/N STATUS
Line 1 ELEMENT	Indicates the name of the database or configuration file that can be crossloaded : - FMS SOFTWARE on Page 2 - NAV DATA BASE on Page 3 - FM AIRLINE CONFIG on Page 4 - FM OPTIONS CONFIG on Page 5 - PERF DATA BASE on Page 6 - MAG VAR DATABASE on Page 7.
Line 2 FMS1 P/N Line 3 FMS2 P/N	These fields display the part numbers of the database or configuration file (stated on line 1), that are installed on the FMS 1 and 2. Identical part numbers are displayed in green, different ones in amber. During crossload, the updated part number is replaced by the “ACCEPTING XLOAD” amber message.

Line 4	This line is empty when the active flight phase is not Preflight or Done. XLOAD FMx TO FMy or START XLOAD FMx TO FMy : This blue prompt is displayed when the database or configuration file (stated on line 1) can be crossloaded. XLOAD ARMED : Displayed in blue on the receiving FM when the crossload has been requested, but not yet confirmed. XLOAD IN PROCESS : Displayed in white, when the crossload is ongoing. A/C ENG NOT SUPPORTED : Related to the Performance Database only. It is displayed when the FMS performance database model is incompatible with the aircraft/engine's pin program. XLOAD NOT SUPPORTED : Crossloading is unavailable for this element. NO P/N TO XLOAD : The element is missing. NEED FG1/FG2 IDENTICAL TO XLOAD : The receiving side's FG software is incompatible with the FG software to be crossloaded. NEED FM1/FM2 SOFTWARE IDENTICAL TO XLOAD : The crossloaded element is incompatible with the receiving side's FM software.
[5L] A/C STATUS	This prompt is available, when no crossload is in process. This gives the pilot access to the aircraft status page. MM : SS MIN REMAINING : Displays the time remaining to complete the crossload, when a crossload is in process.
[6L] PREV PAGE ABORT	This key calls up the previous P/N STATUS page. This amber prompt is displayed when a crossload is in progress. The pilot uses it to stop the crossload.
[6R] NEXT PAGE CONFIRM*	This key calls up the next P/N STATUS page. This amber prompt is displayed when a crossload has been armed. The pilot presses it to start the crossload.

POSITION MONITOR PAGE

Ident.: DSC-22_20-50-10-28-00000853.0008001 / 14 MAY 12
Applicable to: MSN 04827-04860

This page displays all the different positions that the FMGC has computed with the various available navigation methods. It also shows which method obtained each position. (The positions should be almost identical).
The pilot calls up this page by pressing the 1L key on the data index page.

POSITION MONITOR AND POSITION FROZEN PAGE

Line 1 FMGC 1	This line displays the latitude and longitude in green, as calculated by the FMGC 1, and the navigation method used by the FMGC for that calculation in white (Example: “3 IRS/DME/DME”).

Line 2 FMGC 2	This line displays the latitude and longitude in green, as calculated by the FMGC 2, and the navigation method used, in white.
Line 3 RADIO or GPS or GPIRS or RADIO DESELECTED	This line displays the latitude and longitude in green, calculated by the onside FMGC from selected radio NAVAIDs (Example: DME/DME, VOR/DME, or LOC) or from GPS or GPIRS. The selected radio NAVAIDs are displayed in white.
Line 4 MIX IRS	This line shows the latitude and longitude of the weighted mean inertial reference system (IRS) calculated by the onside FMGC from the available IRSs.
Line 5 IRS 1,2,3	This line shows the deviation in nautical miles of each IRS position from the onside FMGC position. It also displays the IRS mode, which can be INVAL, ALIGN, NAV or ATT. *Note:* *INVAL is displayed when an ADIRS has failed, or the IRS position is not refreshed.*
[6L] FREEZE/UNFREEZE (blue)	The pilot presses this key to freeze (or unfreeze) all the data displayed on the page. When the data is frozen, the title of the page specifies the time at which it was frozen.
[6R] SEL NAVAIDS	The pilot presses this key to access the selected navaids page.

SELECTED NAVAIDS PAGE

```

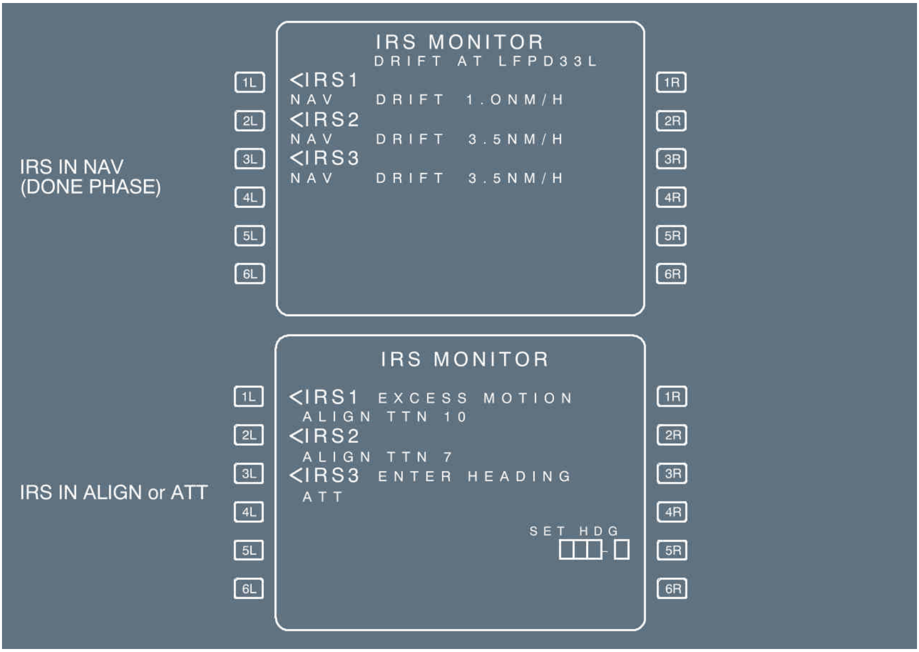
[1L]	This field displays the ident of the NAVAID tuned for display purposes, in blue, and the frequency of the NAVAID in green.
[2L] to [3L]	These fields display the ident of the NAVAIDs tuned for the calculation of the radio position by the FMGC, in blue, and the frequency of the NAVAIDs in green.
[4L]	This field displays the ident of the landing system (XLS) in blue, and the frequency (or the channel) of the landing system in green. *Note:* *For fields [1L] to [4L] the class of the tuned NAVAID or the landing systems, and the tuning mode (AUTO, MAN, or RMP) are displayed in white in the label field.*
[5L]	The flight crew presses this key to manually select or deselect the NAVAIDs. If the flight crew selects (deselects) the NAVAIDs for position calculation, “RADIONAV SELECTED” (“RADIONAV DESELECTED”) is displayed in the label line in blue small font and “DESELECT” (“SELECT”) is displayed in white large font. By default NAVAIDS are selected. The deselection of the RADIONAV inhibits use of radio position (either DME/DME or VOR/DME) for position calculation.
[6L]	The flight crew presses this key to manually select or deselect the GPS. If the flight crew selects (deselects) the GPS, “GPS SELECTED” (“GPS DESELECTED”) is displayed in the label line in blue small font and “DESELECT” (“SELECT”) is displayed in white large font. By default GPS is selected. If the flight crew deselects the GPS, “GPS IS DESELECTED” MCDU message is displayed when the aircraft is less than 80 NM from the top of descent, or in approach phase.

[1R] to [5R]	The flight crew deselects a NAVAID by entering the NAVAID identifier in one of these four fields. Once deselected, the flight crew can manually tune the NAVAID by entering the ident of the NAVAID for display purposes. The deselection can be cleared: - Manually, by a CLR action in this field, or - Automatically upon transition to the done or preflight phase, or upon activation of the second database. The flight crew may deselects as many as four stations. If the flight crew attempts to deselect a NAVAID that has been previously deselected, the “XXXX IS DESELECTED” MCDU message is displayed.
[6R] RETURN	The flight crew presses this key to return to the POSITION MONITOR page.

IRS MONITOR PAGE

Ident.: DSC-22_20-50-10-28-00000856.0003001 / 23 JUN 15
Applicable to: MSN 04827-04860

This page displays the IRS data. The crew calls up this page by pressing the IRS monitor prompt of the DATA INDEX 1/2 page.



```
        IRS MONITOR
      DRIFT AT LFPD33L
<IRS1
NAV     DRIFT  1.0NM/H

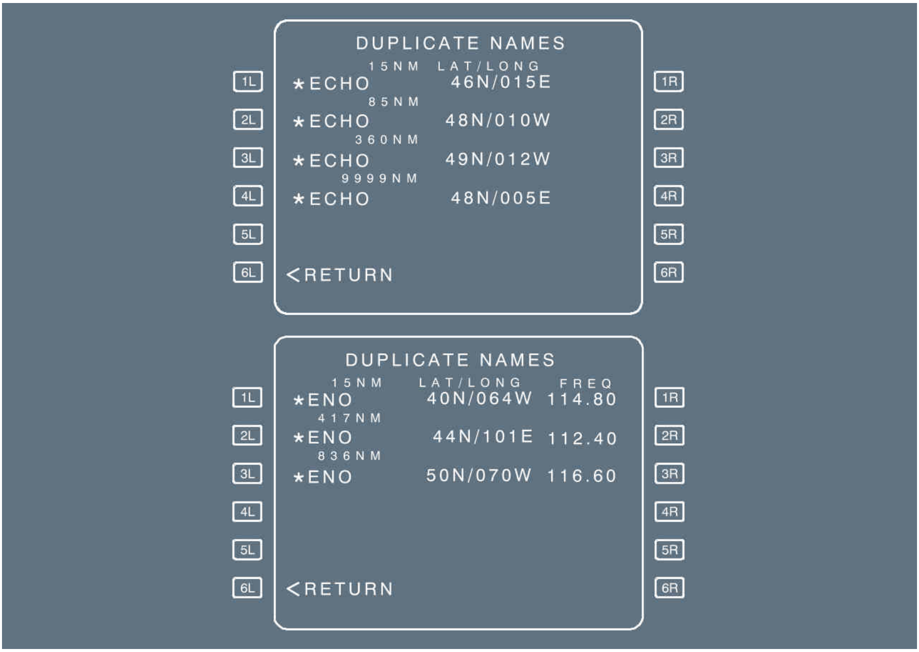
TITLE	Displays the selected IRS in large white font. When data is frozen, IRS is replaced by “IRS FROZEN AT”, followed by the time at which the pilot has frozen the display.
[1L] POSITION	Displays the latitude/longitude given by the selected IRS.
[2L] TTRK	True track
[3L] THDG	True heading
[4L] WIND	True wind direction/velocity
[5L] GPIRS	GPS/IRS hybrid position of the IRS
[6L] FREEZE/UNFREEZE	Allows the crew to freeze or unfreeze all data displayed on all three IRS pages. When the data is frozen, the title of the page specifies the time at which it was frozen. It is automatically unfrozen when exiting the page.
[2R] GS	Ground speed
[3R] MHDG	Magnetic heading
[4R] GPIRS ACCUR	GPS/IRS Figure of Merit (meters or feet)

[6R] NEXT IRS	This prompt enables another IRS page (closed loop IRS 1 → 2 → 3 → 1) to be displayed.

DUPLICATE NAMES PAGE

Ident.: DSC-22_20-50-10-28-00000852.0001001 / 23 JUN 15
Applicable to: MSN 04827-04860

This page automatically appears and enables the pilot to select a specific waypoint, airport, or NAVAID, when the database has more than one with the same identifier.



```
      DUPLICATE NAMES
       15NM  LAT/LONG
*ECHO         46N/015E
       85NM
*ECHO         48N/010W
      360NM
*ECHO         49N/012W
     9999NM
*ECHO         48N/005E

<RETURN
```

```
     DUPLICATE NAMES
    15NM   LAT/LONG   FREQ
*ENO       40N/064W 114.80
   417NM
*ENO       44N/101E 112.40
   836NM
*ENO       50N/070W 116.60

<RETURN
```

The pilot presses the key adjacent to a waypoint, NAVAID, or airport, to select it as the one to be entered. When the pilot has finished, the page automatically reverts to the previously displayed page.

DISTANCE

The direct distance to the aircraft is displayed in green above each name. If this distance is greater than 9 999 NM, then +9 999 NM is displayed.

LAT/LONG COLUMN

This column lists the rounded off latitudes and longitudes of the different points, using the same identifier.

FREQ/CHAN COLUMN

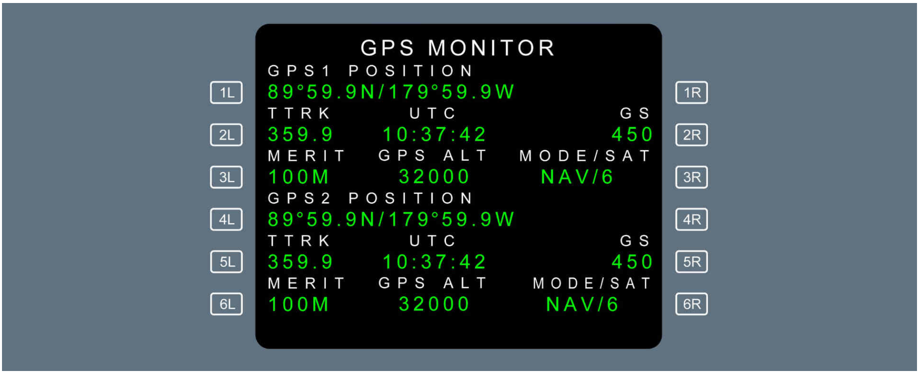
This column lists the NAVAIDs frequencies, if any. It displays CHAN for an MLS.

Note:
- *The DUPLICATE NAMES page is not displayed, when 2 waypoints with the same ident belong to the same airway. The system selects the first waypoint found in the database.*
- *The waypoints or NAVAIDs are ranked according to their distance from the aircraft's position.*
- *When a waypoint is named using ICAO phonetic alpha characters, a minus sign and the ICAO code of the country where the waypoint is located, are displayed. e.g. Alpha in France becomes A-LF ; Bravo in England becomes B-EG.*

GPS MONITOR PAGE ◁

Ident.: DSC-22_20-50-10-28-00000858.0001001 / 26 JAN 22
Applicable to: MSN 04827-04860

This page displays the GPS data. The flight crew calls up this page by pressing the GPS MONITOR ◁ prompt of the DATA INDEX page.



```
        GPS MONITOR
GPS1 POSITION
89°59.9N/179°59.9W
TTRK       UTC           GS
359.9    10:37:42       450
MERIT    GPS ALT   MODE/SAT
100M      32000      NAV/6
GPS2 POSITION
89°59.9N/179°59.9W

MERIT    GPS ALT   MODE/SAT
100M      32000      NAV/6
```

[1L] and [4L]	Display the GPS 1 and 2 positions.
[2L] - [2R] and [5L] - [5R] TTRK-UTC-GS	Display the GPS 1 and 2 true tracks. UTC fields indicate UTC time for each GPS sensor. GS fields indicate the GPS 1 and 2 ground speed.

[3L] - [3R] and [6L] - [6R] MERIT-GPS ALT-MODE/SAT	Display the GPS 1 and 2 figures of merit (in meters or feet). GPS ALT is displayed for information purposes. It is not used by the FMGS. MODE/SAT fields indicate the GPS 1 and 2 modes followed by the number of satellites tracked. The GPS can operate in the following modes: INIT : System initialization ACQ : Satellite acquisition NAV : Normal mode TEST : System test FAULT : Invalid system ALTAID or AIDED : Degraded modes. The MMR uses aircraft inputs for computation purposes.

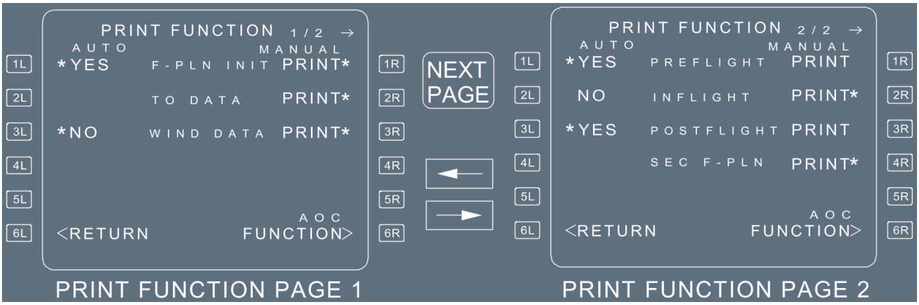
PRINT FUNCTION PAGES

Ident.: DSC-22_20-50-10-28-00009558.0001001 / 16 MAR 11
Applicable to: MSN 04827-04860

The PRINT FUNCTION pages enable the crew to print the data relative to the current flight.

This data comes from 2 different sources:
- ACARS uplink messages, and
- Active data from the current flight.

The pilot may access these pages from the “DATA INDEX” page1/2, by pressing the [6R] ACARS/PRINT FUNCTION key.



PRINT FUNCTION 1/2 →

NO INFLIGHT PRINT*
*YES POSTFLIGHT PRINT
SEC F-PLN PRINT*
AOC
<RETURN FUNCTION>

PRINT FUNCTION PAGE 2

PRINT FUNCTION PAGE 1/2

This page displays the status of the automatic printing capabilities, for the uplink messages (left column), and the status of the manual printing capabilities of the current active data (right column).

LEFT COLUMN

AUTO

* YES (blue)	Line 1 : Uplink messages related to flight plan INIT data are automatically printed when received. Line 2 : Uplink messages related to takeoff data are automatically printed when received. Line 3 : Uplink messages related to wind data are automatically printed when received.
NO (without an asterisk)	Automatic printing is internally deactivated for the data of the line. The pilot cannot reactivate it manually.
Blank	The ACARS function is not available for this line. Uplink messages can neither be received nor automatically printed.

RIGHT COLUMN

MANUAL	Displays the status of the manual printing capability of the active data (and not of the ACARS uplink data).
PRINT * (amber)	Pressing the right keys prints the following active data: Line 1 : Active flight plan INIT data Line 2 : Active takeoff data Line 3 : Active wind data

Printing is only possible, if the asterisk appears.
When the key is pressed, the asterisk disappears until the data is printed.

[6L] RETURN	Pressing this key reverts the display to the DATA INDEX page.
[6R] ACARS FUNCTION	Pressing this key reverts the display to the ACARS FUNCTION page.

PRINT FUNCTION PAGE 2/2

This page describes the printing capabilities of the reports displayed on lines 1 to 4.

LEFT COLUMN

AUTO (white)

* YES (blue)	Line 1 : The PREFLIGHT report is automatically printed at engine start. Line 2 : The INFLIGHT report is automatically printed at takeoff. Line 3 : The POSTFLIGHT report is automatically printed at engine shutdown.

NO (without an asterisk)	Automatic printing is internally deactivated for the report. The pilot cannot reactivate it.

RIGHT COLUMN

MANUAL	Pressing a right key prints the report displayed on the line.
PRINT *	It is not possible to print, if the asterisk does not appear. When the key is pressed, the asterisk disappears until the report is printed. Regarding the PREFLIGHT, INFLIGHT, and POSTFLIGHT reports: Only one can be printed at a time, depending on the applicable flight phase. For the SEC F-PLN report, the print selection start is only displayed if a secondary flight plan exists.

AOC FUNCTION PAGE (IF INSTALLED)

```

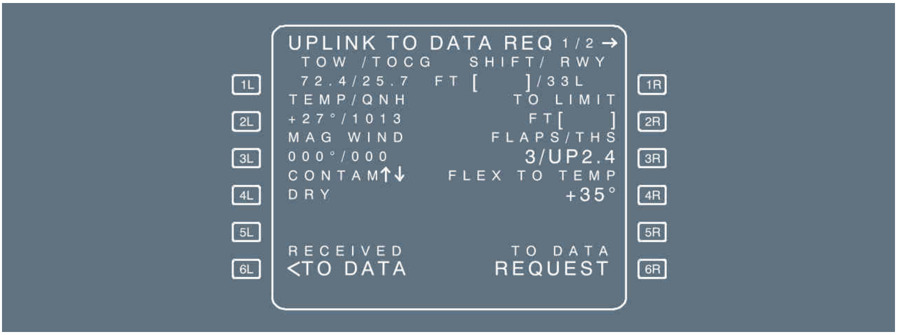
TITLE	White.
[1L] TOW/TOCG (green)	This field is dashed, until a runway is defined in the [1R] field. The TOW/TOCG is defaulted to the values of the INIT B and FUEL PRED pages. If not available, dashes are displayed. It cannot be modified by the pilot.
[2L] TEMP/QNH or QFE (green/blue)	This field is dashed, until a runway is defined in the [1R] field; TEMP = Defaulted to SAT, and cannot be modified by the crew. BARO = Defaulted to FCU selection and can be modified by the pilot.
[3L] MAG WIND (blue)	This field is dashed, until a runway is defined in the [1R] field. It displays the wind at the origin. The pilot can modify this field.
[4L] CONTAM (blue)	This field is dashed, until a runway is defined in the [1R] field. The display is defaulted to DRY. The scroll keys are used to modify the runway contamination: DRY, WET, 1/4 WATER, 1/2 WATER, 1/4 SLUSH, 1/2 SLUSH, COMP SNOW.

[6L] RECEIVED TO DATA	This field calls up the UPLINK MAX (or FLX) TO DATA page that displays the data received by ACARS.



```
UPLINK TO DATA REQ 1/2 →
 TOW /TOCG      SHIFT/ RWY
 72.4/25.7   FT [    ]/33L
TEMP/QNH          TO LIMIT
+27°/1013         FT[     ]
MAG WIND        FLAPS/THS
000°/000           3/UP2.4
CONTAM↑↓      FLEX TO TEMP
DRY                   +35°

RECEIVED           TO DATA
<TO DATA           REQUEST
```

[1R] SHIFT/RWY (blue)	This field is dashed, until a runway is defined in the F-PLN. If a runway is defined in the F-PLN, it is automatically filled in as: SHIFT = Value from the PERF TO page, or blue brackets [ ], if no value is defined. RWY = F-PLN departure runway. The pilot can modify this field.
[2R] TO LIMIT (blue)	It is dashed, until a runway is defined in the [1R] field. It displays blue brackets [ ], when a runway is defined. The pilot may enter a length, considering runway obstacles.
[3R] FLAPS/THS (blue)	This field is dashed, until a runway is defined in the [1R] field; it is then defaulted to values from the PERF TO page. Blue brackets are displayed, if the PERF TO page does not have any defined values.
[4R] FLEX TO TEMP (blue)	This field is dashed, until a runway is defined in the [1R] field; it is then defaulted to values from the PERF TO page. Blue brackets are displayed, if the PERF TO page does not have any defined values. The pilot can modify this field and enter a FLEX TO temperature (FXX).
[6R] TO DATA REQUEST* (amber)	Pressing this key sends the takeoff data request message to the ground. The asterisk disappears when the request is sent. It reappears when the data is available.

Page 2/2 is used for requesting a second runway data.

Note: *If the UPLINK TO DATA REQ Page 2 is accessed (Page 1 being filled), the fields on this page are filled in with default values after entering of a runway in the [1R] field. QNH or QFE, and wind are common with Page 1.*

 UPLINK          INSERT
<TO DATA        UPLINK*
```

This page is accessed from the UPLINK TO DATA REQ page by pressing the RECEIVED TO DATA key.
There is a set of 2 pages (MAX TO DATA and FLEX TO DATA) for each of the 4 uplinked runway data. Uplinked data is displayed in green. (It cannot be modified by the pilot).

[1L] TOW/TOCG	Uplinked reference Takeoff Gross Weight and Takeoff Center of Gravity.
[2L] TEMP/QNH (or QFE)	Uplinked assumed temperature and baro setting.
[3L] MAG WIND	Uplinked takeoff runway wind.
[4L] CONTAM	Uplinked takeoff runway contamination.
[5L] THR RED/ACC	Uplinked Thrust Reduction and Acceleration altitudes.
[6L] UPLINK TO DATA	Pressing the key calls up the UPLINK TO DATA REQ page
V1 , VR, V2	Uplinked takeoff speeds.
[1R] SHIFT/RWY	Uplinked TO runway ident, runway intersection, and position shift.
[2R] TO LIMIT	Uplinked runway length remaining.
[3R] FLAPS/THS	Uplinked FLAPS/SLATS CONF and TRIM position.
[4R] FLEX TO	Pressing this key calls up the UPLINK FLEX TO DATA pages.
[5R] ENG OUT ACC	Uplinked engine-out acceleration altitude.

[6R] INSERT UPLINK *

Uplinked Takeoff data is available for insertion.

Selecting this prompt inserts the following data in the PERF TO page:
- V1, VR, V2
- THR RED/ACC, ENG OUT ACC altitudes
- FLAPS/THS
- SHIFT
- FLEX

The display reverts to the PERF TO page, the asterisk disappears.

This field is not displayed, if the runway does not match the active runway. If the runway matches the active runway but the uplinked TOW differs from the current TOW:
- The asterisk disappears and the insertion is not possible (the uplink TOW is 3 t greater or 1 t lower than the TOW estimated by the FMS).
- The TOW value is displayed in amber in [1L] field.

Note: All previously received data is replaced by the new uplinked data.

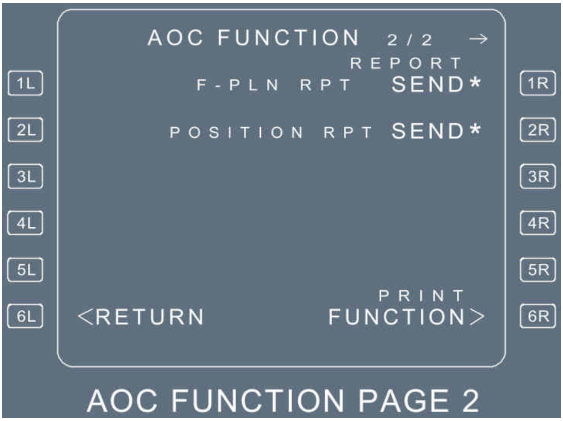
TITLE

UPLINK FLX TO DATA in white.

[2L]	FLX/QNH (or QFE) When the UPLINK FLEX TO DATA page is selected, it displays uplink assumed Flex Temperature and baro setting (QNH or QFE).
[4R] MAX TO	Pressing this key calls up the MAX TO DATA page. For all other fields, refer to MAX TO DATA page.

Ident.: DSC-22_20-50-10-28-D-00000902.0001001 / 16 MAR 11

AOC FUNCTION PAGE 2 (IF INSTALLED)



Line 1 F-PLN RPT SEND	Pressing this key sends the flight plan report to the ground.
Line 2 POSITION RPT SEND	Pressing this key sends a Position Report to the ground.

Note:
- *No report can be sent, if “SEND” is not followed by an asterisk.*
- *When a function (line 1 or 2) is deactivated via the navigation database policy file, the corresponding line is blank.*

[6L] RETURN	The pilot presses this key to revert to the DATA INDEX page.
[6R] PRINT FUNCTION	The pilot presses this key to access the PRINT FUNCTION page.

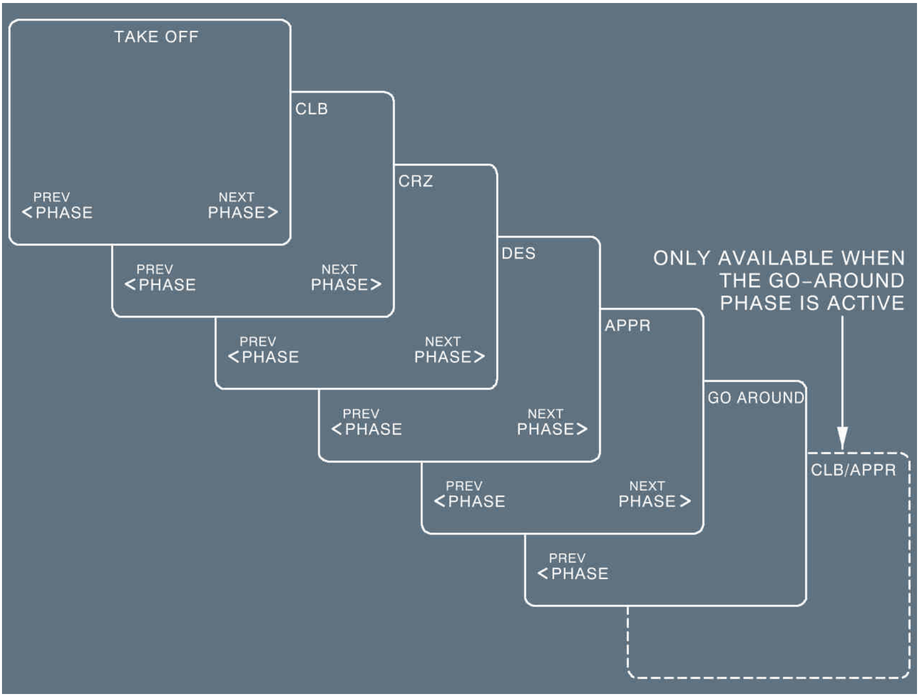
PERF PAGE

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-E-00000903.0001001 / 01 OCT 12

The flight plan is divided into the following phases :
PREFLIGHT, TAKEOFF, CLIMB, CRUISE, DESCENT, APPROACH, GO-AROUND, DONE.

Each phase, except for the preflight and done phases, has a performance (PERF) page. The PERF pages display performance data, speeds related to the various phases, and predictions.
Pressing the PERF key on the MCDU console calls up the performance page for the current active phase. Performance pages, relating to phases already flown, are unavailable.
In the preflight and done phases, pressing the PERF key brings up the takeoff performance page.
Pressing the PERF key in the done phase makes the phase transition to the preflight phase.



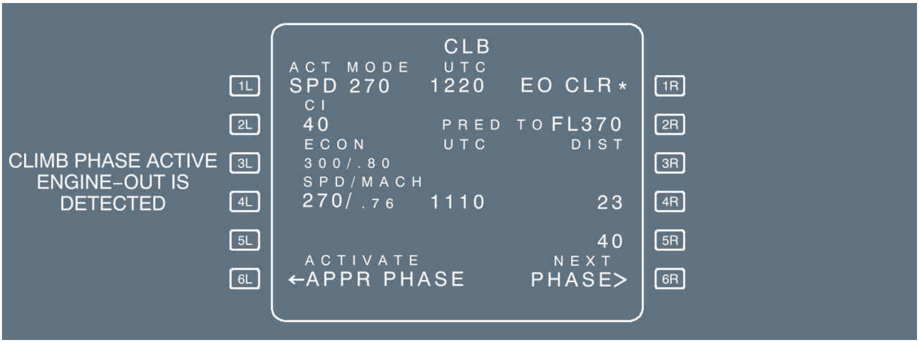
TAKE OFF
PREV <PHASE
NEXT PHASE>
CLB
PREV <PHASE
NEXT PHASE>
CRZ
PREV <PHASE
NEXT PHASE>
DES
PREV <PHASE
NEXT PHASE>
APPR
PREV <PHASE
NEXT PHASE>
GO AROUND
PREV <PHASE
ONLY AVAILABLE WHEN THE GO-AROUND PHASE IS ACTIVE
CLB/APPR

The FMGS flight phases are unrelated to the FWC flight phases.

Line 6	Fields may display two different prompts, depending upon whether the phase is active or not.
[6L] PREV PHASE	To review the performance page for the previous phase. The prompt is unavailable on the takeoff performance page. It is also unavailable for phases already flown.
[6L] ACTIVATE APPR PHASE	To activate, then confirm, the APPR phase. It is only available on the page corresponding to the active phase.
[6R] NEXT PHASE	To review the performance page for the next phase.

Note: ***"EO CLR*" prompt***

- *When the FMGS detects an engine-out condition, the system automatically calls up the performance page for the current flight phase (except when this occurs before the diversion point during takeoff, or no EOSID exists in the flight plan), and displays "EO CLR*" in the [1R] field.*
  If the pilot presses the [1R] key, the system reverts to the normal processing (with no engine failed) and suppresses the EO information.
- *If the engine-out condition is detected before the diversion point at takeoff, a temporary flight plan is created.*



CLIMB PHASE ACTIVE ENGINE-OUT IS DETECTED

<TO DATA                PHASE>
```

Flaps/Slats retraction speeds and green dot speeds provided by the FMGC once aircraft GW has been computed

TITLE	TAKE OFF RWY is in large green font when the takeoff phase is active, and in large white font when it is inactive. The active flight plan selected runway is displayed in large green font.

<u>Note:</u> *If the takeoff shift, or the flaps/THS, or the runway is changed after V1, V2 or VR insertion, but the origin airport remains the same, the MCDU "CHECK TAKEOFF DATA" message appears, but all takeoff parameters are retained (except in case of runway change.They are invalidated, but still displayed adjacent to each field. The "CONFIRM TO DATA" prompt in [6R] allows reverting to the previous values).*

[1L] V1 [2L] VR [3L] V2	The boxes remain amber, as long as the pilot does not make entries in them. The pilot can modify any entry, as long as the takeoff phase is inactive. *Note:* *1. If the pilot does not enter V2, the SRS mode will be unavailable at takeoff.* *2. The MCDU “V1/VR/V2 DISAGREE” amber message appears if the inserted V1, VR, V2 do not satisfy the condition: V1 ≤ VR ≤ V2* *3. The MCDU "TO SPEED TOO LOW" amber message is displayed if the Take-Off Speeds entered by the flight crew are not above the minimum control speeds.*
[4L] TRANS ALT (transition altitude)	This field displays the navigation database default altitude (if defined), once the origin airport is entered. The pilot can modify it.
[5L] THR RED (thrust reduction altitude)	This is the altitude at which the pilot should reduce the thrust from TOGA/FLX to MAX CLIMB (CL detent) with all engines operative (“CLB” or “LVR CLB” flashing on the FMA). - The thrust reduction altitude defaults to 1 500 ft above the runway elevation, or to the altitude set by the airline. - The pilot can modify this altitude: The minimum is 400 ft above the runway elevation.

ACC (Acceleration altitude)	This is the altitude at which the climb phase is triggered. - The target speed jumps to the initial climb speed. - The default value is 1 500 ft above runway elevation. - The flight crew can modify the value. The minimum value is 400 ft above runway elevation, and it can be higher than, or equal to, or lower than THR RED. *Note:* - *A clearing action reverts both values to the defaulted ones.* - *When the crew selects an altitude on the FCU that is below THR RED, it brings THR RED and ACC down to this altitude. (The 400 ft minimum still applies).*
[6L] UPLINK TO DATA	This key calls up the UPLINK TO DATA REQ page. It is only displayed in the preflight and done phases.
[1R] EO CLR	EO CLR is displayed when an engine-out is detected and when active flight phase is takeoff.
[2R] TO SHIFT	The takeoff shift is the distance in meters or feet between the beginning of the runway and the aircraft's takeoff position. When taking off from an intersection, the flight crew should insert this value to ensure a correct update of the FM position. The takeoff shift value must be positive, and cannot be greater than the runway length.
[3R] FLAPS/THS	This is a flight crew entry for the positions of the flaps and the trimmable horizontal stabilizer (THS) at takeoff. The flight crew can modify it until takeoff, by entering “UP X.X” or “X.X UP”, or “DN X.X” or “X.X DN” for the THS.
[4R] FLX TO TEMP or DRT TO (if installed) or FLX TO	The pilot inserts the FLX TO temperature for FLX takeoff setting purposes, or a derate ◁ level. The pilot can only enter it during preflight. The system sends it to the FADEC and displays the entered data on the upper ECAM display. The TEMP value is always entered in degrees Celsius.

[5R] ENG OUT ACC	This field displays the engine-out acceleration altitude, as defined in the database, or is manually entered by the flight crew. This is for display only, as a reminder. It cannot be cleared. The above ACC altitude rules of [5L] apply to this field.
[6R] NEXT PAGE or CONFIRM TO DATA*	This key calls up the climb performance page, or allows the pilot to revert to the previously-entered T.O. parameters, in case of runway change with the same origin airport.

```

TITLE	CLB is displayed in large green font when climb phase is active, and in large white font when it is inactive.
[1L] ACT MODE	This field displays the preselected or active speed mode: SELECTED or MANAGED. The pilot cannot modify it from this field.

[2L] CI (Cost Index)	This field displays the cost index, as initialized on the INIT A or defaulted from the database, or inserted in this field by the pilot. RTA CI automatically replaces the cost index value, if a time constraint exists in the F-PLN. Note: *In case of an engine-out, EO LRC (engine-out long range cruise) replaces the CI field.* *You can enter a cost index and overwrite EO LRC. In this case, clearing the cost index reverts to EO LRC.*
[3L] MANAGED	This field displays the FMGS computed ECON speed/Mach *Refer to DSC-22_20-40-10 Optimization*. Before the CLIMB phase is active, if the preselected speed mode is SELECTED, an asterisk appears next to the MANAGED speed. In this case, pressing the 3L key preselects MANAGED speed, and 4L reverts to brackets.
[4L] PRESEL or SELECTED	**If the climb phase is active:** - The title of this field becomes "SELECTED". - This field displays the selected (or preselected) SPD or MACH target. - The flight crew cannot modify this field directly, but can adjust it with the FCU's SPD/MACH selection knob. - If the flight crew pushes in the FCU's SPD/MACH selection knob to revert to managed speed, the system selects (or reselects) ECON SPD/MACH, and [4L] is blank. **If the climb phase is inactive:** - This field displays PRESEL, as long as the climb phase is inactive. - The flight crew can only enter a preselected speed.
[5L]	EXPEDITE is displayed in green small font in the [5L] label line when the takeoff or climb phase is active. The flight crew cannot engage EXPEDITE from this field. It indicates the time and distance required to reach the altitude displayed in the 2R field, in case of climb at green dot. If the climb phase is active, T/O PHASE is displayed. This field enables the flight crew to access the PERF TAKE OFF page.
[6L] PREV PHASE	This field displays this legend, if the climb phase is inactive. The flight crew presses this key to call up the takeoff page.

[6L] ACTIVATE APPR PHASE	The field displays this legend, if the climb phase is active. Pressing this key once displays “CONFIRM APPR PHASE*”. Pressing it again activates the approach phase.
[1R] EO CLR	In case of engine-out detection, the [1R] field displays the EO CLR prompt.
[2R] PRED TO...	This field displays the target altitude for the predictions shown in the 3R, 4R, or 5L field. It defaults to the FCU altitude, but the pilot can modify it to any altitude below MAX ALT.
[3R] [4R]	These fields show time and distance predictions for the target altitude selected in [2R], computed for the current vertical mode and speed mode (MANAGED, SELECTED). These fields are only displayed while the takeoff, or climb phase is active.
[6R] NEXT PHASE	The flight crew presses this key to call up the PERF CRZ page.

```

TITLE	CRZ is in large green font, when the cruise phase is active, and in large white font, when it is inactive.
[1L] ACT MODE	This field shows the preselected or active speed mode : SELECTED or MANAGED. The flight crew cannot modify it from this field.
[2L] CI	This field shows the cost index, as initialized on the INIT A page or defaulted from the database, or as inserted in this field by the flight crew. RTA CI automatically replaces the cost index value, if a RTA exists in the F-PLN. EO LRC automatically replaces the cost index value in case of an engine-out.

[3L] MANAGED	This field displays the FMGS-computed ECON speed/Mach *Refer to DSC-22_20-40-10 Optimization*. Before the CRUISE phase is active, if the preselected speed mode is SELECTED, an asterisk appears next to the MANAGED speed. In this case, pressing the 3L key preselects MANAGED speed, and 4L reverts to brackets.
[4L] PRESEL	If the cruise phase is active: This field is blank. If the cruise phase is inactive: The flight crew can enter a preselected speed or Mach number. Note: *If the flight crew enters a value in the PRESEL field during the cruise altitude capture (ALT CRZ*), the FCU selected speed may revert to M 0.01.*
[6L] PREV PHASE or	The flight crew can press this key to call up the climb page, if the cruise phase is not yet active.
[6L] ACTIVATE APPR PHASE	This field displays this legend, if the cruise phase is active. The flight crew presses this key once to change the legend to “CONFIRM APPR PHASE*”. A second press activates the approach phase. Note: *If the flight crew inadvertently activates the approach phase, the flight crew can reselect the cruise flight level from the progress page, in order to reactivate the cruise phase.*
[1R] TIME/UTC DEST EFOB	Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the flight crew enters an estimated takeoff time, the field automatically displays the predicted arrival time (UTC) at destination. After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board (DEST EFOB) at destination, in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB values displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] STEP TO FL XX, TO T/D, or DRIFT DOWN	This field, in combination with 3R and 4R, displays the predictions for the step point and step altitude, the Top of Descent, or the drift down altitude.
[3R] and [4R] TIME/UTC and DIST	These fields display the time and distance to go to the various points identified in the 2R field.

[5R] DES CABIN RATE	This field displays MAX [computed DES cabin rate, maximum descent cabin rate]. The flight crew may modify the value : The FM then recomputes the top of descent, in order to match this value. If the FM cannot match the flight crew's entry, the FM-computed value overwrites the flight crew's entry. A clear action reverts to the default value (-350 ft/min). DES CAB RATE being a negative value, "minus" is not a necessary entry.
[6R] NEXT PHASE	This key calls up the DES page.

TITLE	DES is in large green font if the descent phase is active, and in large white font if it is inactive.
[1L] ACT MODE	This field displays the preselected or active speed mode (MANAGED or SELECTED). The flight crew cannot modify it from this field.

[2L] CI	This field displays the cost index, as initialized on the INIT A page or defaulted from the database, or inserted in this field by the flight crew. RTA CI automatically replaces the cost index value, if a time constraint exists in the F-PLN. The flight crew cannot modify in descent/approach phase below the descent speed limit altitude, or FL 100, whichever is higher.
[3L] MANAGED	Before the flight crew makes any entry, this field displays "MANAGED" in white, with the associated ECON descent Mach or speed, in blue. The crew may overwrite the ECON descent Mach or speed, by entering a Mach number or a speed in this field. The system uses the pilot's entry to compute the descent profile. The descent may be flown in managed, using this new pilot entry. The entry is modifiable. It can be cleared to revert to ECON speed/Mach.
[4L] blank or SELECTED	**If the descent phase is inactive, or the descent phase is active but the active speed mode is MANAGED:** - This field is blank. **If the descent phase is active, and the active speed mode is SELECTED:** - The field displays the speed or Mach target manually selected by the pilot. “SELECTED” is displayed in the [1L] field. - To modify the field value, the pilot uses the FCU's SPD/MACH selector knob. The [4L] field and FCU window will display the same value. - Pushing in the FCU speed selector knob activates the managed SPD/MACH target displayed in the [3L] field.
[5L] Blank or EXPEDITE	If the descent phase is inactive, this field is blank. Displays this legend, if the descent phase is active. It indicates the time and distance required to reach the altitude displayed in the 2R field at MMO/VMO speed. The pilot cannot select the EXPEDITE mode from this field.
[6L] PREV PHASE or ACTIVATE APPR PHASE	This key calls up the cruise phase page, if the descent phase is not yet active. Displayed, if the descent phase is active. Pressing this key once makes “CONFIRM APPR PHASE” appear. A second press activates the approach phase.

[1R] TIME/UTC DEST EFOB	Before takeoff, this field displays the flight time to destination and the predicted remaining fuel on board. If the crew enters an estimated takeoff time, the field automatically displays the predicted arrival time (UTC). After takeoff, it displays the predicted arrival time at destination (UTC) and the remaining fuel on board (DEST EFOB) at destination, in green font. The DEST EFOB field will turn to amber, if the EFOB at destination becomes less than the MIN DEST FOB value displayed on the FUEL PRED page. EO CLR is displayed when an engine-out is detected.
[2R] PRED TO...	This field displays the target altitude for the predictions in [3R], [4R], or [5L]. The display defaults to the FCU-selected altitude. The flight crew can modify it to any altitude lower than the present altitude.
[3R] [4R]	These fields display time and distance predictions down to the target altitude selected in [2R], computed for the current vertical mode (DES or OP DES) and the indicated speed mode (MANAGED or SELECTED).
[6R] NEXT PHASE	The pilot presses this key to call up the PERF APPR page.

Ident.: DSC-22_20-50-10-28-E-00016135.0012001 / 10 MAY 21

F, S, GREEN DOT and VLS speeds computed by the FG assuming the landing weight. NOTE: VLS is the VLS of the selected LDG CONF (3 or FULL)

TITLE	The page title displays APPR, if the Approach phase is not active or APPR, if it the Approach phase is active.

[1L] QNH

This field displays brackets, when the aircraft is more than 180 NM from the destination. Inside 180 NM, mandatory amber boxes appears.

The flight crew must enter the QNH in hectopascals (hPa) or in inches of mercury (inHg). The value is either entered in hPa or inHg:
- For hPa, enter three or four digits within the allowable range for hPa, or
- For inHg, enter the four digits of the desired value with or without a decimal point, within the allowable range for inHg.

The system interprets:
- 1 003 as 1 003 hPa
- 2900 as 29.00 inHg
- 29.92 as 29.92 inHg.

The flight crew can modify this entry at any time.

Note: *An erroneous entry of an OAT or BARO minimum in QNH field (e.g. 22 °C or 2 200 ft) is accepted by the system. As a consequence, the CPC computes an erroneous cabin pressurization segment during descent, then may trigger a pressurization ECAM alert.*

The FMS uses the QNH:

- To compute the descent profile
- To compute the FLS beam on aircraft equipped with the FLS ◁ option.

[2L] TEMP

This field displays the temperature at destination. Until the flight crew enters the temperature, the field displays brackets. The flight crew can modify this figure.
The system uses this temperature to:

- Refine its computation of the descent profile (ISA model)
- Compute the FLS beam on aircraft equipped with the FLS ◁ option.

[3L] MAG WIND or TRUE WIND

In this field, the flight crew enters the magnetic wind at the destination in knots. The system transmits any entry made in this field to the VERTICAL REVISION and FLIGHT PLAN B pages (which display wind direction as true, not magnetic).

[4L] TRANS FL	This field displays the transition flight level, computed by the FMS based on the transition altitude (extracted from the database) and the QNH value entered in the [1L] field. It is rounded to the upper multiple of 5. By default, it is displayed in small font. The flight crew can modify it (it is then displayed in large font).
[5L] VAPP	The FMGC computes this approach speed, using the formula: VAPP = VLS + 1/3 of the headwind components (limited to VLS +5 kt as a minimum and VLS +15 kt as a maximum). The flight crew can modify VAPP. A clear action reverts VAPP to the computed value. *Note:* *VLS = 1.23 VS1G of the selected landing configuration (FULL or 3).*
[6L] PREV PAGE	This field displays this legend, if the approach phase is not active. Pressing this key calls up the PERF DES page.
[1R] FINAL	This field displays the approach specified in the flight plan. The flight crew cannot modify it from this field.

[2R] MDA/MDH or BARO ◁	This field displays:
	- The MDA with associated brackets, or
	- The MDH with associated brackets, if:
	  - The aircraft is equipped with QFE ◁ option, or
	  - The FCU setting is QFE, if the aircraft is equipped with the BARO ◁ option.
	The flight crew inserts the value, which can be modified at any time. If the flight crew makes an entry in the [3R] field, or changes the approach, it clears this figure.

[3R] DH or RADIO ◁	If the flight plan includes an ILS, GLS ◁ or MLS ◁ approach, this field displays DH or RADIO ◁ and empty brackets. For a CAT II or CAT III approach, the flight crew inserts the decision height. The decision height is a radio altimeter height. The system will accept an entry of NO. If the flight crew inserts an MDA or an MDH (or a BARO ◁ value) in [2R] field, this erases the decision height, and the field reverts to brackets. The RADIO ◁ range is from 0 to 700 ft.
[4R] LDG CONF CONF 3	The flight crew can select CONF 3 by pressing this key. This moves the * down to the [5R] field, that displays FULL.

[5R] FULL	The flight crew can use this key to select CONF FULL when necessary. CONF FULL is the default landing configuration.
[6R] NEXT PHASE	Pressing this key calls up the PERF GO AROUND page.

GO AROUND PHASE ACTIVE

TITLE	GO AROUND is in large white font, if the go-around phase is not active; it is in large green font if it is.
[5L] THR RED ACC	This field displays the thrust reduction altitude and the acceleration altitude. **Thrust reduction altitude:** - Altitude at which thrust must be reduced from takeoff/go-around thrust to maximum climb thrust. - “CLB” or “LVR CLB” flashing on the flight mode annunciator. - Defaults to 1 500 ft above destination runway elevation, or to the altitude set by the airline. - Can be modified by the crew (minimum 400 ft above destination runway elevation). **Acceleration altitude:** - Altitude at which target speed increase to Green Dot speed (See the note below). - Defaults to 1 500 ft above the destination runway elevation, or to the altitude set by the airline. - Can be modified by the crew, but is always equal to or higher than the thrust reduction altitude.
[6L] PREV PHASE or	This field displays this legend, if the go-around phase is inactive. Pressing the key calls up the PERF APPR page.

ACTIVATE APPR PHASE	This field displays this legend, if the go-around phase is active. Pressing it once makes “CONFIRM APPR” appear. A second press activates the approach phase.
[5R] ENG OUT ACC	This display has the same characteristics as the display beside the 5R key on the takeoff page. It is for display only, and the pilot can modify it.
[6R] NEXT PHASE	Pressing this key calls up the PERF APPR page.
[1R] Blank or EO CLR*	This field is normally blank. EO CLR* is displayed when the GO AROUND phase is active, and an engine-out condition is detected.

Note: When the go-around phase is active, if the pilot enables ALTN or if the pilot inserts a new destination in the active flight plan, the go-around phase automatically shifts into the climb phase. (The target speed jumps from green dot speed to initial climb speed).

PROG PAGES

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-F-00000910.0030001 / 17 NOV 20

The progress page is a multifunction page that enables the pilot to:
- Select a new cruise flight level;
- Crosscheck the navigation accuracy of the Flight Management (FM) system and validate it;
- Update the FM position;
- Monitor the descent.

TITLE	Different for each flight phase (see above). The vertical phase is in large green font. The flight number is in large white font. EO is large amber font, if the engine-out condition is detected.
Line 1 CRZ (blue)	This line displays the cruise flight level, inserted on the INIT A page or directly in this field in blue. If the FCU is used to select an altitude that is higher than the one displayed, the system changes the displayed number to match the one selected by the FCU. In this line, the flight crew cannot insert a flight level that is lower than the FCU-selected altitude. This field shows dashes when the descent or approach phase is active.

OPT	This field displays the optimum flight level (in green), that is computed based on the current gross weight, cost index, temperature, wind This flight level requires a 5 min minimum cruise time at a minimum cruise flight level of FL 100. It displays dashes if an engine-out is detected:
REC MAX	This field displays the recommended maximum altitude (in magenta), that is computed based on the current gross weight and temperature, and assuming that the anti-ice is off (if icing conditions are expected, use the performance application of the EFB). It provides the aircraft with a 0.3 g buffet margin, a minimum rate of climb at MAX CL thrust, and level flight at MAX CRZ thrust. This field is limited to FL 398. If one engine is out, this field displays the recommended maximum engine-out altitude, that is computed based on the long-range cruise speed and assuming that anti-ice is off.
[2L] REPORT	This key calls up the REPORT PAGE.
[2R] VDEV	This field is displayed during the descent and approach phases, when NAV mode is engaged without crosstrack error limitation, or in HDG mode, provided that the crosstrack error (XTK) is less than 4 NM. In the particular case of a DIR TO RADIAL INBND, this field is displayed while the DIR TO RADIAL INBND is flown without crosstrack error (XTK) limitation. It displays the vertical deviation between the aircraft's current altitude and the FMGC-computed vertical profile.

----         ----        FL390
*SEND POS       VDEV= + 750FT
```

Line 3 UPDATE AT	The flight crew can update the FMGC position via this field by entering either the IDENT of a waypoint, a NAVAID, an airport, a latitude and longitude, or a place/bearing/distance, or a place-bearing/place-bearing. When the flight crew has entered this data, this field changes its format to: “CONFIRM UPDATE AT”, followed by the latitude/longitude and IDENT of the inserted position with an asterisk. The flight crew presses the right-hand key adjacent to the asterisk to confirm the update, when the aircraft overflies the inserted position.

Note: *If no IDENT has been inserted, the field displays “ENTRY”, instead of an IDENT.*

Line 4 BRG/DIST

On this line, the pilot can enter an airport, a waypoint, a NAVAID, or a runway. The pilot may enter each as an IDENT, a latitude/longitude (LL), a place/bearing/distance (PBD), or a place-bearing/place-bearing (PBX). The field then shows the FMGC-computed bearing and distance from this site to the aircraft's present position. The last distance digit is in 1/10 of a NM. If it does not have an IDENT, the point is called "ENTRY".

Example: BRG/DIST
340 °/95.4 to ENTRY

[5L] PREDICTIVE GPS ⊲

This prompt gives access to the PREDICTIVE GPS page.

[5R] GPS PRIMARY ◁	This prompt is displayed when the FMS navigation mode is GPS PRIMARY. This field is blank, when GPS PRIMARY is unavailable, or the navigation mode is not GPS/IRS. When the GPS PRIMARY function is not embedded, this field displays: - The “REQD DIST TO LAND = ” - The “DIR DIST TO DEST = “ The scratchpad displays the relevant “GPS PRIMARY″ message when this prompt appears, and “GPS PRIMARY LOST” when the field goes blank.
[6L] REQUIRED	This field displays the default value for the required navigation accuracy level. The pilot can modify it. Provided no pilot entry has been made, the default value changes according to the actual flight area (enroute, terminal, approach; *Refer to DSC-22_20-40-10 General*).
ACCUR HIGH/LOW	This field shows the flight management system's estimate of navigational accuracy. “HIGH” indicates that the FMS estimates that the navigational accuracy matches the accuracy criteria of the currently flown area. “LOW” indicates the criteria is not matched.
[6R] ESTIMATED	This field displays the current estimated navigation accuracy value (EPE), as computed by the FMS.

Ident.: DSC-22_20-50-10-28-F-00000911.0001001 / 04 DEC 18

PREDICTIVE GPS PAGE (IF INSTALLED)

Note: 1. *This page is only displayed with Honeywell ADIRS.*
2. *This page cannot be used as a substitute to determine pre-flight planning RAIM availability when required by operational regulations. Refer to PRO-NOR-SOP-02 GPS PRIMARY Availability (If Installed).*

The pilot accesses this page by pressing the PREDICTIVE GPS prompt of the PROG page. This page displays information relative to predictive availability of GPS PRIMARY at destination and at any waypoint selected by the crew.

[1L] DEST	This field displays the destination airport, as currently selected in the active flight plan. It cannot be modified. Dashes appear in this field, when no destination airport exists.
[1R] ETA	This field is defaulted to the estimated arrival time, as computed by the FMS (small blue font). The pilot may enter a value in this field (large blue font). Amber boxes are displayed when no prediction exists, or when the crew entry has been cleared.
Line 2 PRIMARY Y/N	This line shows the predicted primary status at the destination airport for the following times: - Estimated time of arrival ± 5, 10, 15 min. - Availability of GPS PRIMARY at the corresponding times, is indicated by Y, if PRIMARY is predicted to be available and by N if GPS PRIMARY is predicted to be unavailable. - These fields are blank, when the destination [1L], or time [1R] field is not defined.
[3L] WPT	The pilot may enter a reference waypoint in this field. Blue brackets appear, when no entry has been made.
[3R] ETA	When a reference waypoint has been entered in the [3L] field, amber boxes appear. The crew is prompted to enter a reference time in this field.
Line 4 PRIMARY Y/N	Information equivalent to [2L]/[2R] is displayed for any pilot-selected waypoint. The corresponding arrival time is also displayed.

Line 5 DESELECTED SATELLITES and Line 6 SATELLITES	This line enables the pilot to deselect up to four satellites by inserting the corresponding satellite number. This number then appears in large blue font. When deactivated, the satellites are not considered for predictive GPS availability at the destination or at a selected waypoint. The deselection is cancelled when the entry is cleared (blue brackets appears), or when the field is overwritten by a different satellite number.

REPORT PAGE IN FLIGHT

This page displays information related to the FROM, TO, NEXT, and DEST waypoints, as well as the current wind, temperature, distance and time to the next cruise profile change.

TITLE (White)	This field indicates the flight number. If an engine-out is detected, this line shows "EO" in amber.
[1L] OVHD (green)	Displays the last sequenced waypoint. This field never displays the pseudo-waypoints and the F-PLN markers (T-P, PPOS, IN-BND, OUT-BND).
[1R] UTC/TIME ALT (green)	Displays the time and altitude recorded at the time of sequence.

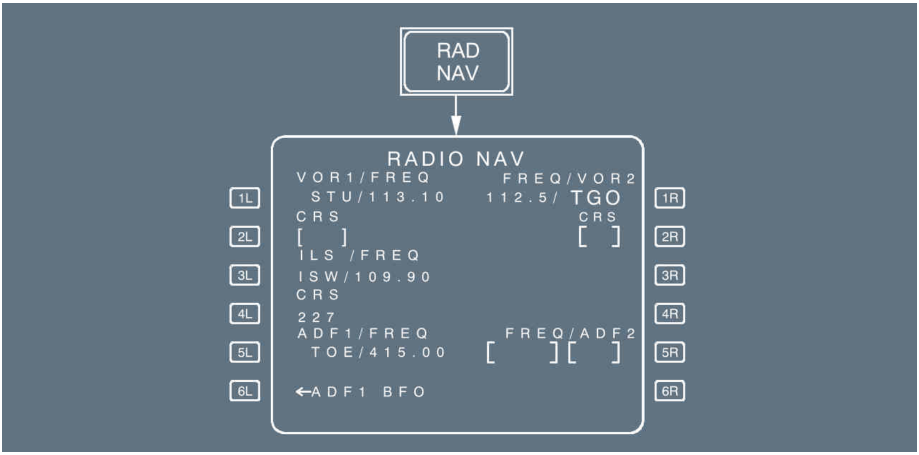
[2L]-[2R] TO (green)	Displays the active waypoint, predicted time of arrival, and predicted altitude at this waypoint. Note: *Time and altitude values are identical to those values on the F-PLN pages.*
[3L]-[3R] NEXT (green)	Same information for the next waypoint.
[4L] [4R] SAT/T.WIND/FOB (green)	This field displays the static air temperature, the wind direction and velocity, and the FOB recorded at waypoint sequencing.
[5L] T/D/UTC/DIST (green)	This field displays the estimated time, and the distance to go to the next change of the cruise profile (T/D, S/C, S/D). This data is only displayed if the cruise phase is active.
[5R] SEND* (blue)	The crew uses this prompt to downlink a position report. This field may be blank, depending on airline policy.
Line 6 DEST/UTC/DIST/EFOB	This field displays the estimated time of arrival, the distance along the F-PLN, and the estimated fuel on board at destination. This display is identical to the information on the F-PLN pages.

Note: *No data can be inserted or modified on the REPORT page.*

RADIO NAV PAGE

Ident.: DSC-22_20-50-10-28-00000913.0002001 / 01 OCT 12
Applicable to: MSN 04827-04860

This page enables the pilot to select or verify the radio NAVAIDs, tuned for display purposes only.
These NAVAIDs include: VOR, VOR/DME, TAC, VORTAC, ILS, and ADF.
If either RMP is set on NAV, this page is blank on both MCDUs.



Line 1 VOR1/FREQ FREQ/VOR2	This line displays the identifiers and frequencies of VORs 1 and 2, whether they are automatically or manually tuned. To manually tune a VOR, the pilot inserts the IDENT or frequency. If the IDENT is not in the database, the new NAVAID page comes up. A “clear” action reverts the selection to the autotuned NAVAID.
Line 2 CRS	This line displays courses for the NAVAIDs in Line 1. The pilot can manually enter the courses from these fields.
[3L] ILS/FREQ	This field displays the IDENT and frequency of an ILS. It is autotuned, if the ILS is associated with the departure runway, or if the flight plan shows an ILS approach selected for the destination. The ILS may also be entered manually. When the manually-entered ILS differs from the ILS that would be autotuned, "RWY-ILS MISMATCH" appears.
[4L] CRS	This field displays the course associated with the ILS in Line 3. It comes up automatically if an ILS is autotuned, or if an ILS has been manually tuned via its IDENT. Otherwise, the course must be entered manually. The course may be backbeam (Bxxx) or frontbeam (Fxxx).
[4R] SLOPE CRS ◁	In this field, the pilot enters the slope and course of the MLS. The course may be backbeam (Bxxx) or frontbeam (Fxxx).
Line 5 ADF1/FREQ FREQ/ADF2	This line displays the identifiers and frequencies of ADFs 1 and 2. The pilot can use the IDENT or the frequency to manually tune the ADF.

Line 6 ADF1/BFO BFO/ADF2	When an ADF is selected, these fields display an ADF/BFO prompt. The flight crew presses this key once to erase the arrow and revert ADF to BFO mode. A clear action recalls the arrow, and cancels BFO.

Note:
- *The autotune function only works for NAVAIDs stored in the database.*
- *When tuning manually, the Operator should use the IDENT, rather than the frequency, unless the NAVAID is not in the database.*
- *Manually-tuned frequencies are displayed in large font.*

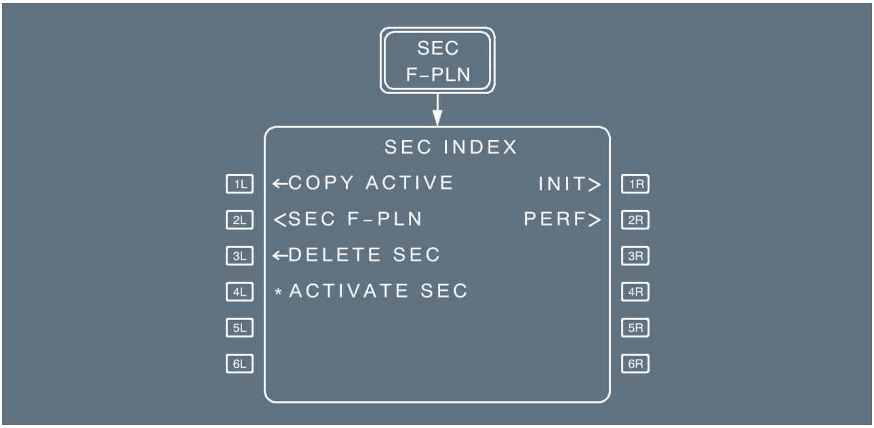
SECONDARY PAGES

Ident.: DSC-22_20-50-10-28-00000914.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

The SEC F-PLN key on the MCDU console allows the flight crew to call up the secondary index page and the secondary flight plan page. The secondary flight plan is generally used to prepare a diversion an alternate routing, for predictable runway changes at takeoff or landing, or for a next flight.
There are two types of secondary index page, depending on whether a secondary flight plan has already been defined.

SECONDARY INDEX PAGE

A SECONDARY FLIGHT PLAN IS ALREADY DEFINED



[1L] COPY ACTIVE (blue)	The pilot presses this key to copy the active flight plan into the secondary flight plan, and to erase the previous secondary plan.

Note: *When created with a copy active, the FROM/TO pair of the secondary flight plan is not modifiable on SEC INIT A page. The SEC F-PLN is to be deleted before any FROM/TO modification.*

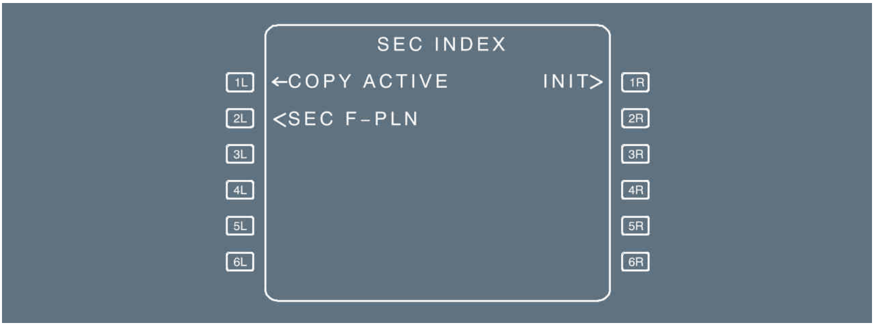
[2L] SEC F-PLN (white)	The pilot presses this key to call up the secondary flight plan pages.
[3L] DELETE SEC (blue)	The pilot presses this key to delete the current secondary flight plan.
[4L] ACTIVATE SEC (amber)	The pilot presses this key to activate the secondary flight plan as the active flight plan. With such an action, activation is immediate and no temporary flight plan is created.

Note: *When flying in NAV mode, it is not possible to activate the SEC F-PLN, if the first leg of the SEC F-PLN is not compatible with the current active leg: If the crew presses the “ACTIVATE SEC” prompt, the SEC F-PLN activation is rejected and the “SELECT HDG/TRK FIRST” message is displayed in the scratchpad.*

- *The SEC F-PLN activation is rejected*
- *The “SELECT HDG/TRK FIRST” message is displayed in the scratchpad.*

[1R] INIT (white)	This prompt is always displayed. It gives access to the SEC INIT A and B pages.
[2R] PERF (white)	The flight crew presses this key to call up the performance pages of the secondary flight plan. In flight, when the active flight plan has been copied, this prompt only appears if the first lateral leg of the secondary flight plan is identical to the active leg of the primary flight plan. During preflight, this prompt is always displayed.

A SECONDARY FLIGHT PLAN IS NOT DEFINED



[1L] COPY ACTIVE (blue)	The pilot presses this key to copy the primary active flight plan into the secondary flight plan.
[2L] SEC F-PLN (white)	The pilot presses this key to call up the secondary flight plan pages.
[1R] INIT (white)	This prompt allows access to the SEC INIT A and B pages. It is similar to the active INIT page, but blue brackets replace all the amber boxes.

SECONDARY FLIGHT PLAN PAGES

The secondary flight plan pages A and B are identical to those of the active flight plan. They are automatically sequenced, only when the secondary flight plan is copied from the primary one and their active legs are identical.

No temporary flight plan is created in a secondary flight plan: the lateral and vertical revisions are directly inserted into the secondary flight plan.

Moreover, the active and secondary flight plan pages differ from one another as follows:

SECONDARY LATERAL REVISION PAGES

- OFFSET and FIX INFO are not available.

SECONDARY INIT A AND B PAGES

- Blue brackets are displayed by default.

SECONDARY STEP ALTITUDE PAGES

These pages operate as the active STEP ALTS page.

SECONDARY WIND PAGES

Do not have a history wind page.

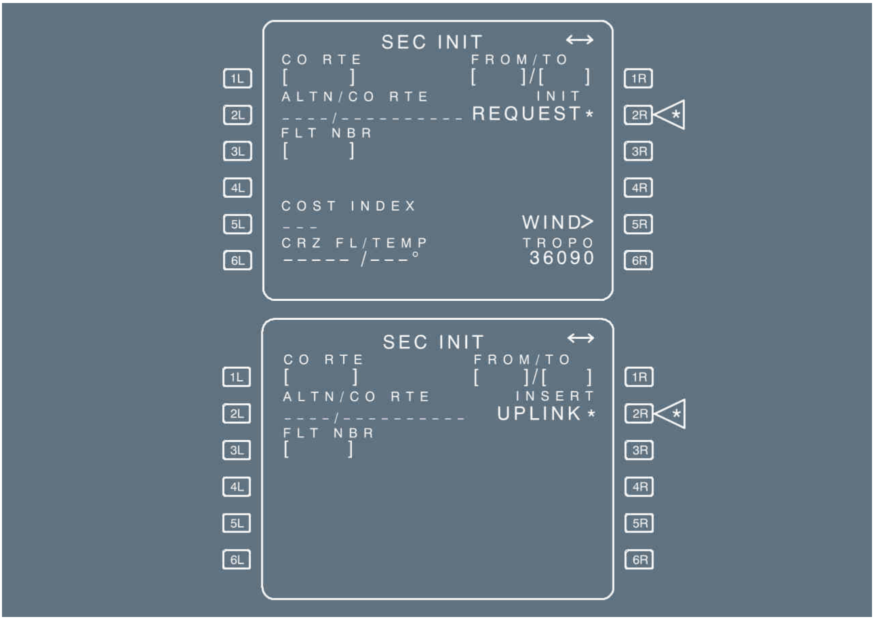
SECONDARY PERFORMANCE PAGES

- All boxes are replaced by blue brackets.
- Have neither an engine-out mode, nor an engine-out long-range cruise cost index.
- Have no expedite predictions.
- Have no ACTIVATE/CONFIRM APPROACH PHASE prompt.
- Have no PRED TO ALTN predictions on the PERF CLB and PERF DES pages.
- Have no top of descent, no cabin descent rate information on the PERF CRZ page.

The secondary flight plan does not have a FUEL PRED page.

THE SECONDARY INIT A PAGE IS ALSO USED TO REQUEST OR DISPLAY AN UPLINK INIT MESSAGE RECEIVED AFTER ENGINE START.

This uplink INIT message can be cleared or inserted as SEC INIT data.



```
           SEC INIT            ↔
CO RTE                  FROM/TO

RADIAL FIX INFO PAGES

Ident.: DSC-22_20-50-10-28-00009559.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

The FIX INFO pages provides access to the RADIAL, CIRCLE and ABEAM intercept functions.
The reference may be a given database fix or a pilot-defined element.
If the radial, circle or abeam intercepts the active or temporary flight plan, the intersection point can be converted to a waypoint and inserted into the flight plan.
The FIX INFO pages may be accessed from the LAT REV page, after performing a lateral revision at the origin airport, or at FROM or at any F-PLN waypoint of the primary flight plan (except Destination).

[1L] REF FIX (blue)	Enables entry of the REF FIX. This reference may be any database element (NAVAID, waypoint, NDB, airport, runway) or a pilot-defined element. Before entry, amber boxes are displayed.

[2L] – [2R] RADIAL (blue) and [3L] – [3R] (blue)	Enables entry of a radial from the REF FIX. If the radial line intersects the active flight plan, the FMGS will compute the time, the along path DIST (Distance To Go), and the altitude at the intersection point (small green font). A large blue selection arrow is then displayed to insert the intersection waypoint into the temporary flight plan. This waypoint is not part of the pilot-stored elements. It is automatically labelled: "XXXNNN" XXX = First 3 letters of the REF FIX ident. NNN = Value of the radial
[4L] - [4R] RADIUS (blue)	This function enables the flight crew to enter a radius that defines a circle around the REF FIX. When the circle intercepts the current flight path, the FMGS will compute the time, the along path distance and the altitude at the first intersection point, from the current aircraft position (small green front). A large blue selection arrow is then displayed to insert the intersection waypoint into the temporary flight plan. This waypoint is not part of the pilot stored element. The waypoint is automatically labelled: "DNNNXXX" NNN = Value of the radius XXX = First 3 letters of the REF FIX ident.
[5L] - [5R] ABEAM	This function enables the pilot to create a waypoint in the flight plan (primary or secondary) that is abeam the reference fix (REF FIX). Once computed, the page displays the radial number in large green font. The FMGS computes the time, the along path distance, and altitude at the abeam point (small green font). A large blue selection arrow is then displayed to insert the waypoint into the temporary flight plan. The waypoint is labelled: "AB" + the REF FIX ident, for example, with "TOU" VOR, "ABTOU".
[6L] TMPY F-PLN or RETURN	This field displays "TMPY F-PLN" in yellow font, if a temporary flight plan exists. It enables to return to the temporary flight plan page. Otherwise, the RETURN prompt is displayed and enables to return to the LAT REV page.
[6R] TMPY INSERT*	Activates the temporary flight plan.

Note: Four FIX INFO pages, providing the capability to define four different REF FIX elements, are available.

CLOSEST AIRPORTS PAGES

Ident.: DSC-22_20-50-10-28-00009560.0001001 / 16 MAR 11
Applicable to: MSN 04827-04860

The FMS automatically selects the four closest airports from the current aircraft position, and displays them on the CLOSEST AIRPORT pages, ranked by distance. The flight crew can select an additional, fifth airport on this page.

- CLOSEST AIRPORTS page 1 displays the bearing, distance, and time to go to each airport
- CLOSEST AIRPORTS page 2 displays the Estimated Fuel On Board (EFOB) and enables the crew to check or modify the effective wind estimated to the corresponding airport.

The flight crew accesses the CLOSEST AIRPORTS page 1 by pressing the [5L] key on the DATA INDEX 1 page. They access the CLOSEST AIRPORTS page 2 by pressing the EFOB/WIND prompt (6R key) on page 1.

CLOSEST AIRPORTS 2

CLOSEST AIRPORTS 1 PAGE

[1L] - [1R] BRG/DIST/UTC (green) to [4L] - [4R]	The closest four airports are extracted from the database, and ranked by distance from the aircraft position.

BRG	Displays the current bearing from the aircraft's position to the airport.
DIST	Displays the current great-circle distance from the aircraft's position to the airport.
UTC	Displays the predicted time of arrival at the airport, computed using the current wind or a wind vector entered on page 2, and the speed in accordance with the current mode (managed or selected). The time is only computed in cruise phase.

[5L]	The crew may enter a fifth airport in this field, using the 4–letter ICAO code. The field may be modified at any time, even when “LIST FROZEN” is displayed.

If the crew enters an airport that is not in the database, a “NOT IN DATABASE” message appears in the scratchpad.

[6L] FREEZE/UNFREEZE (cyan)	This prompt enables the pilot to freeze and unfreeze the list of four airports. The list is automatically frozen when accessing page 2. It will remain frozen until returning to page 1. The “LIST FROZEN” message is always displayed on page 2.
[6R] EFOB/WIND	Gives access to page 2. Pressing this prompt automatically freezes the list of the four closest airports.

CLOSEST AIRPORTS 2 PAGE:

[1L] - [1R] EFOB (green) to [5L] - [5R] EFF WIND (cyan)	Displays the EFOB at each airport. The EFOB is only computed in cruise phase. Used to enter an estimated effective wind (headwind or tailwind) along the route to the airport. If the entry is preceded by “+”, “T”, or “TL”, a tailwind is assumed. If the entry is preceded by “–”, “H”, or “HD”, a headwind is assumed. This field displays in small font a default value, based on the current wind experienced by the aircraft. The crew can modify this value, it is then displayed in large font. The effective wind is used to compute the EFOB and time to reach the airport.

[6L] RETURN	Returns to page 1.

Note:
- *If the aircraft position becomes invalid, all BRG, DIST, UTC fields are dashed. The CLOSEST AIRPORTS page still displays the last available list of 4 closest airports and the last crew-defined airport (if any). FREEZE/UNFREEZE and EFOB/WIND prompts are removed, LIST FROZEN is displayed, and the A/C POSITION INVALID message is displayed in the scratchpad. Page 2 cannot be accessed.*
- *Predictions (EFOB, TIME) displayed on the CLOSEST AIRPORTS page assume:*
  - *ECON CRZ speed (managed) or current selected speed (selected) is kept;*
  - *CI (for managed speed only) and CRZ FL from the active F-PLN are kept*
  - *A constant wind value;*
  - *In case of engine out, the aircraft altitude is the minimum of (CRZ FL, EO MAX ALT);*
  - *Downpath steps are not considered;*
  - *Descent fuel burn is a conservative value which only depends on the difference between current CRZ ALT and the destination airport altitude.*

EQUI - TIME POINT PAGE

Ident.: DSC-22_20-50-10-28-00009561.0004001 / 18 MAR 11
Applicable to: MSN 04827-04860

The flight crew uses this page to request an equi-time point computation between two different points (airport, NAVAID, runway, NDB or waypoint). This pseudo-waypoint (ETP) is displayed on the navigation display along the F-PLN. The EQUI-TIME POINT page is accessed by pressing the 6L key on the DATA INDEX 1 page:

(ETP) 382 0908
COMPUTED EQUI-TIME POINT

[1L] A/C TO and [3L] (blue)	Displays reference waypoint 1. Displays reference waypoint 2.

Note: Origin and destination airports are used by default for respective reference points 1 and 2, until a pilot entry is made.

[1R] BRG/DIST/UTC and [3R] (green)	Displays the bearing, distance, time, from the aircraft's current position to the reference waypoint 1. Displays the bearing, distance, time, from the current position of the aircraft to the reference waypoint 2. BRG : Displays the current great-circle bearing from the position of the aircraft to the reference waypoint. DIST : Displays the current great-circle distance from the position of the aircraft to the reference waypoint. UTC : Displays the predicted time of arrival at the reference waypoint (computed using the current wind or a wind vector, entered by the crew). The time is only computed in cruise phase. In other phases, it is dashed.
[2L] and [4L] TRU WIND (blue)	The crew may enter the wind (direction/velocity) at the reference waypoint and CRZ FL: This wind value is used to calculate the time from the position of the aircraft to the reference waypoint, and to locate the equitime point. If no entry is made, the wind/velocity is assumed to be equal to zero.
[2R] and [4R] ETP TO XXXX (green)	Displays the bearing distance and the time from the Equi-Time Point (ETP) position to the reference waypoint.
[5R] ETP LOCATION	Displays the ident of the F-PLN waypoint following the equitime point. It provides the distance along the flight plan from the ETP to the indicated waypoint.
[6L] - [6R] A/C TO (ETP) DIST/UTC (green)	This field displays the distance from the current position of the aircraft to the ETP along the flight plan, and the estimated time of arrival at the ETP. If at least one reference waypoint exists, but no ETP exists, the field is blank and NO ETP is displayed in 6L.

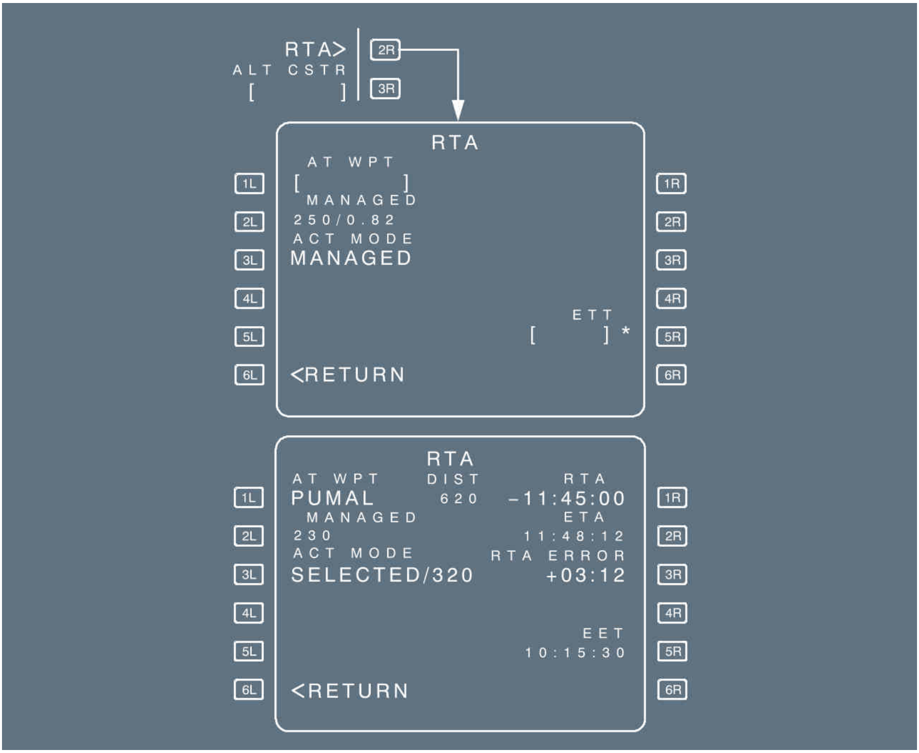
Note: The ETP computation is based on the cost index, managed speed (with SPD LIM).
In case of engine-out, the EO LRC speed is assumed.
If the ETP fix is an airport, the ETP computation takes into account the descent towards this airport.

RTA PAGE

Ident.: DSC-22_20-50-10-28-00009562.0021001 / 14 MAY 12
Applicable to: MSN 04827-04860

The RTA (Required Time of Arrival) page enables to enter a time constraint on a given waypoint.
When an RTA has been defined at a waypoint, the RTA page provides the following information:
- Predicted ETA at the time-constrained waypoint
- Performance adjusted SPD target
- Time error
- Distance to time constrained waypoint
- Active speed mode.

The RTA page also allows to enter an Estimated Takeoff Time (ETT), or may display an FMS-computed ETT.
The flight crew calls up this page with the RTA prompt from the VERT REV page.



RTA>

SELECTED/320 | | +03:12
EET
10:15:30
<RETURN

[1L] – [1R] AT WPT/DIST/RTA	This line displays AT WPT and empty blue brackets, when no waypoint has been specified, or AT WPT, DIST and RTA when a waypoint has been defined. The waypoint identifier is displayed in large blue font. If only the waypoint identifier has been defined and no RTA value, blue brackets and a blue star are displayed facing the 1R prompt. The flight crew enters the time constraint as “HHMMSS”, preceeded by: A “–“ sign for “at or before” A “+” sign for “at or after” no sign for “at”. DIST is displayed in yellow if a temporary flight plan exists.
[2L] MANAGED (yellow/green)	This field displays the FMGS-computed ECON speed/Mach (*Refer to DSC-22_20-40-10 General*) used to respect the RTA. Speed and/or Mach are displayed in yellow if a temporary flight plan exists. Otherwise they are displayed in green.
[3L] ACT MODE (green)	Displays the active speed mode: MANAGED or SELECTED/NNN (NNN is the selected target speed). The crew cannot modify the active speed mode via this field.
[6L] TMPY F-PLN (yellow) or RETURN (white)	The crew presses this key to revert the display to the VERT REV page. The TMPY F-PLN prompt accesses the temporary F-PLN page.
[2R] ETA (yellow/green)	When a required time at arrival has been defined, the 2R field displays the estimated time of arrival as “HHMMSS”. ETA is displayed in yellow if a temporary flight plan exists. Otherwise it is displayed in green.
[3R] RTA ERROR	This field is blank when the RTA is predicted as made. The RTA is predicted as missed, if the aircraft is expected to reach the point at RTA +30 s or later. In this case, “RTA ERROR” is displayed in small white font, and the calculated time error between the ETA and the RTA is displayed in small amber font.
[5R] ETT	The Estimated Takeoff Time (ETT) field is available in preflight phase. If no ETT has been entered, the 5R field displays blue brackets and a blue star. When an ETT has been entered, it is displayed in magenta. This field may also display an FMS-computed ETT, when an RTA has been defined. Entry of ETT does not lead to the creation of a temporary flight plan.
UTC	Universal time is displayed in green for takeoff, climb, cruise, descent and approach phases.

[6R] TMPY INSERT *	Activates the temporary flight plan.

CONSTANT MACH PAGE

Ident.: DSC-22_20-50-10-28-00009563.0004001 / 01 OCT 12
Applicable to: MSN 04827-04860

The CONSTANT MACH page allows the crew to specify a constant Mach value to be kept during a given part of the cruise phase. The crew can specify on this page:
- The desired constant Mach value
- The Start and End waypoint of the constant Mach segment.

The constant Mach segment is flown in MANAGED speed mode. The FMS takes the crew-entered constant Mach into account to calculate the cruise predictions.

Note: A constant Mach may also be defined in the SEC F-PLN.

The CONSTANT MACH page is accessed by pressing the CONSTANT MACH prompt [4L] on the VERT REV page from any waypoint, including the FROM waypoint.
If the page is accessed from a VERT REV at the FROM, the proposed default start waypoint will be PPOS.
The CONSTANT MACH page is accessible in pre-flight, takeoff, climb and cruise phases. A constant Mach may only be defined cruise segment.

[1L] MACH (blue)	Enables the entry of the desired Mach value waypoint is displayed in large blue font.

[2L] START WPT (blue)	Enables the Start waypoint of the constant Mach segment to be specified. The default Start waypoint is the waypoint at which the vertical revision has been performed, if it belongs to the cruise phase. Otherwise, the field is blank. The default Start waypoint (if any) is displayed in small blue font. The crew may select a different Start waypoint in the list of selectable F-PLN waypoints. A crew-selected Start waypoint is displayed in large blue font.
SELECTABLE F-PLN WPTS (blue) [3L] – [3R] [4L] – [4R] [5L] – [5R]	This is the list of the F-PLN waypoints that can be selected as Start or End waypoint of the constant Mach segment. The FMS automatically displays the list of all downpath waypoints belonging to the cruise phase (before the T/D). The crew selects the Start waypoint in the list on the left side, and the End waypoint on the right side.
[6L] <RETURN (white) or <TMPY F-PLN (yellow)	If a temporary F-PLN exists, the prompt <TMPY F-PLN is displayed. This enables the crew to return to the TMPY F-PLN page. If no TMPY F-PLN exists, the <RETURN prompt is displayed. It enables a return to the VERT REV page.
[2R] END WPT (blue)	This field enables the End waypoint of the constant Mach segment to be specified. By default, the End waypoint is the Top of Descent (T/D). The default End waypoint is in small blue font. The crew may select a different End waypoint in the list of selectable F-PLN waypoints. A crew-selected End waypoint is displayed in large blue font.
[6R] TMPY INSERT*	Activates the temporary flight plan.

BACK UP NAV PAGES

Applicable to: MSN 04827-04860

Ident.: DSC-22_20-50-10-28-G-00013272.0006001 / 16 MAR 11

The MCDU features a back up navigation function which provides simplified point-to-point GPIRS and IRS based navigation in case of a dual FM failure.

The backup Navigation mode allows limited lateral flight planning within the MCDU, that can be used to drive the Navigation Display and provides relative path position information and auto-sequencing of the Backup Navigation flight plan. The Backup Navigation flight plan reflects, as much as possible, the active primary FM flight plan upon its initial activation.

During FM normal operation, the F-PLN is continuously downloaded in the MCDU memory: the BACK UP NAV function links the MCDU of the failed FM to its onside IRS. All navigation data related to the MCDU F-PLN are displayed on the associated ND.

BACK UP NAV function is activated on the MCDU MENU page by pressing the NAV B/UP prompt.

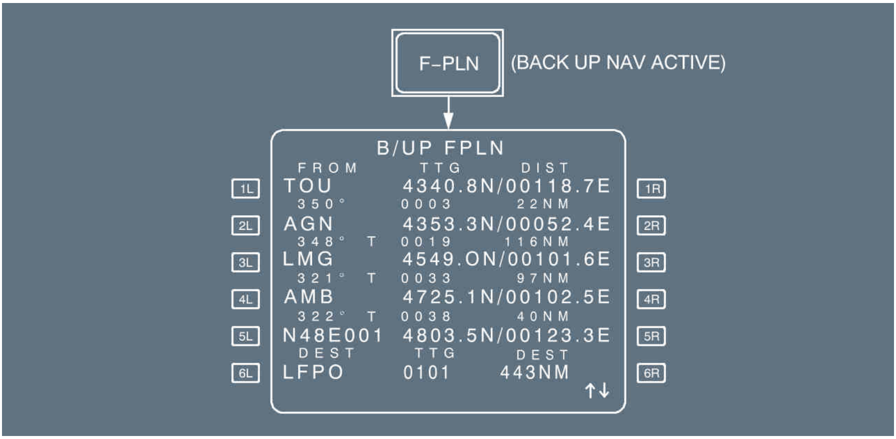
The MCDU back-up F-PLN may accept a maximum of 150 legs, including information such as waypoint position/identification, leg type, discontinuity, overfly and turn direction information (radial, pattern, heading leg... cannot be part of the MCDU F-PLN). No secondary or temporary F-PLN exists.

BACK UP NAV pages display the data related to the BACK UP NAV function. These are six pages available while BACK UP NAV is active:
- B/UP F-PLN
- B/UP F-PLN for DIRECT TO
- B/UP PROG
- B/UP IRS for onside IRS (1+2)
- B/UP IRS 3
- B/UP GPS (if the GPS is installed)

Ident.: DSC-22_20-50-10-28-G-00013273.0006001 / 23 JUL 12

B/UP F-PLN PAGE

The B/UP F-PLN page displays the MCDU F-PLN data. The pilot calls up this page by pressing the F-PLN MCDU key while B/UP NAV is active.



```
          B/UP FPLN

                           ↑↓
```

TITLE	B/UP F-PLN is displayed in a white large font

line 1 to line 5 Display consecutive waypoints with their associated latitude/longitude. If a waypoint is to be overflown, an overfly symbol (Δ) is displayed after the identifier.
If a turn is specified into the next leg, a large font arrow is displayed after the identifier.

Label lines contain the bearing, time to go and distance to the next waypoint displayed in small font.

White	bearing
green	time to go and distance
BRG	Between FROM and TO waypoints: True or Mag depending on the TRUE pb-sw ◁ position. T is displayed when the bearing is true referenced. Between other waypoints: out bound true track of the great circle joining the 2 related waypoints, independant of TRUE pb-sw ◁ .
TTG	HHMM limited to 9 959. Time between the 2 related waypoints.
DIST	NM limited to 9 999.

line 6 DEST/TTG DIST DEST airport identifier and Time To Go (TTG) to that waypoint. DIST to destination is computed as the direct distance from the aircraft to the active waypoint plus the along flight plan distances. Time to go to destination is computed as distance to destination divided by ground speed.
TTG and DEST are dashed if aircraft position is unavailable.

TITLE	B/UP PROG is displayed in a white large font.
line 1 OVHD/ALT	Displays the identifier of the last sequenced waypoint and the altitude at the time of the sequence.

line 2 BRG/DIST/TTG/TO	Allows the flight crew to enter an existing MCDU F-PLN waypoint identifier or LAT/LONG or IDENT/LAT/LONG. MCDU then computes bearing, distance and time to go to that waypoint from the present position. BRG : True or magnetic outbound track of the great circle joining aircraft present position to the entered waypoint: dependent on the TRUE pb-sw ◁ position. DIST : limited to 9 999. TTG : HHMM limited to 9 959. time to go to the entered position computed assuming current ground speed. These fields are displayed in a green small font. They are dashed if present position is unavailable.
[3L]	Means of navigation used by the Back-Up Navigation. If GPS is fitted and is the navigation source, “GPS NAV” is displayed, otherwise “IRS ONLY NAV” is displayed. If the GPS is not installed, this field is blank.
[4L] IRS 1 (2 or 3) BASED POS GPIRS 1 (2 or 3) (green)	Current aircraft position provided by the selected IRS GPIRS IRS 1 (or 3 if IRS 1 failed) on MCDU 1 IRS 2 (or 3 if IRS 2 failed) on MCDU 2 GPIRS 1 (or GPIRS 3) or MCDU 1 ◁ GPIRS 2 (or GPIRS 3) or MCDU 2 ◁
[4R] GS (green)	Current ground speed from the selected IRS or GPS ◁
[5L] DTRK/TRK (green)	Desired track of the MCDU F-PLN active leg and current aircraft track from the selected IRS/GPS (True or Mag). These tracks are true or magnetic depending on TRUE pb-sw ◁ position.
[6L] IRS 1 (2)	Gives access to onside B/UP IRS (1 or 2) page
[6R] GPS	Gives access to B/UP GPS page. This prompt only appears when the GPS is installed.

MCDU MESSAGE LIST

1 Ident.: DSC-22_20-50-20-35-00000918.0040001 / 12 MAY 22
Applicable to: MSN 11531

Messages displayed on the MCDU are of two types and displayed in two colors.

Type I : A direct result of a flight crew action;
Type II : Information about a situation, or a call for flight crew action;
Type II messages are stored in a first-in/first-out message queue (5 messages max)
They are suppressed, if correct data is entered or when they no longer apply
The flight crew can clear all messages by pressing the CLEAR key on the MCDU console.
Amber : Important
White : Less important

MESSAGE	TYPE	CONDITIONS
A/C POSITION INVALID	II	The aircraft position has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the aircraft position is still invalid, then the message is displayed again.
ACT RTE UPLINK (ACARS msg)	II	A flight plan is stored in the active flight plan.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the INIT A page is not displayed on either side of the flight deck. The ALIGN IRS message requires that one of the flight crew call up the IRS INIT page, to align the IRS.
ALT CSTR ABOVE CRZ FL	II	This appears when a flight plan altitude constraint has been ignored because the flight crew has inserted a cruise flight level or step-down altitude that is strictly below the flight plan constraint.
AREA RNP IS XX-XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area and when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot entered VIA on the AIRWAYS page does not contain the revised point. If you enter a second airway IDENT, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.
CABIN RATE EXCEEDED	II	This message appears when the aircraft gets within 200 NM of the destination and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CHECK ALTN WIND (ACARS msg)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION *EFIS PFD (FMA)	II	Displayed when a NON-ILS or non GLS approach is part of the F-PLN and an ILS/GLS is manually tuned on RAD NAV page. This message reminds the flight crew that available guidance modes for the approach are APP NAV/FINAL. Displayed when in cruise at less than 100 NM from the top of descent or in descent or approach phase.
CHECK CO RTE (ACARS msg)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK IRS/AIRPORT POS	I	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM
CHECK DEST DATA (ACARS msg)	II	The aircraft is at 180 NM from destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page received by ACARS uplink has to be checked. If a modification of these parameters is performed creating a conflict with previous data, the message is triggered again.
CHECK FLT NBR (ACARS msg)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE sw does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK QFE	II	This appears at the transition from QNH to QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.
CHECK TAKEOFF DATA	II	Following a flight crew entry or modification of one of the take-off parameters, there may be an inconsistency between the take-off runway or the TO shift and V1, VR, V2, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CHECK WEIGHT	II	- The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 US tons) (in flight only), or - An active secondary or swap active is performed and the ZFWCG or ZFW of the active F-PLN differs from the ZFWCG or ZFW in SEC F-PLN (before engine start), or - An active secondary or swap active is performed and the ZFW of the active F-PLN differs from the ZFW in SEC F-PLN by more than 5 t (after engine start).
CLK IS TAKEOFF TIME	II	This appears when the flight crew has entered an Estimated Takeoff Time (ETT), and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	Aircraft clock time and GPS time differ by more than XX minutes.
CROSSLOAD ABORTED	II	Message displayed on the transmitting MCDU, indicating an error in the transmission process.
CROSSLOAD COMPLETE	II	The database crossload from one FMGC to the other was successfully completed.
CRZ FL ABOVE MAX FL	II	This appears when the flight crew enters a cruise altitude that is above the computed maximum altitude.
CSTR DEL UP TO WPT 01	II	This appears when constraints get deleted because the aircraft transitions to a go-around flight phase, before the FMGS sequences the flight plan destination.
DELETING OFFSET	II	This appears when the system is deleting an offset automatically, which it does under certain specific conditions, such as: - Change of active leg due to lateral revision. - Termination of next leg at destination runway and the current distance to go is less than or equal to the distance required to reach the path, or the next leg is not a CF, FM or TF leg.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU while the direct to page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is out of the range specified for the selected field.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
FLS SEL: UPDATE MINIMA	I	SLS ◁* has been deselected in RADIO NAV page through the dedicated prompt. The guidance mode has switched to FLS. LP or LPV minima can no longer be used. The flight crew should modify the approach minimum to LNAV/VNAV or LNAV, if available, or choose another adequate approach.
FLT NBR UPLINK (ACARS msg)	II	A flight number has been added to the uplink flight plan without previous request.
F-PLN ELEMENT RETAINED	I	The flight crew attempts to delete stored NAVAIDs, waypoints or runways that are contained in any flight plan or that are being tuned.
F-PLN FULL	II	There is not enough memory in the flight plan allotment for the computer to accept more flight plan data.
FMS 1/FMS 2 A/C STS DIFF	II	This message always precedes a transition to independent mode, and appears at power-up if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline program pins
FMS 1/FMS 2 GW DIFF	II	Onside and offside aircraft weight differ by 2 t or more.
FMS 1/FMS 2 PGM PIN DIFF	II	Onside and offside program pins are different.
FMS 1/FMS 2 POS DIFF	II	Onside and offside positions differ by 0.5 NM or more (5 NM when GPS is not installed).
FMS 1/FMS 2 SPD TGT DIFF	II	Onside and offside target speeds displayed on the PFD differ by 5 kt or more.
FMS SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
GPS PRIMARY LOST (also displayed on ND)	II	Displayed when GPS PRIMARY mode is lost.
GPS PRIMARY	II	Displayed when the FMS is transitioning to GPS PRIMARY
GPS IS DESELECTED	II	This message appears when GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHT/CG	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INVALID FLT NBR UPLINK (ACARS msg)	II	The uplink message contains a valid flight plan but no flight number.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
INVALID PERF UPLINK (ACARS msg)	II	Performance uplink message has been rejected.
INVALID RTE UPLINK (ACARS msg)	II	An error was detected into the uplink message and it is rejected.
INVALID TAKEOFF UPLINK (ACARS msg)	II	The current uplink takeoff data message is rejected.
INVALID WIND/TEMP UPLK (ACARS msg)	II	The current uplink wind message is rejected.
LARGE NDB NOT ALLOWED	II	The size of the Navigation Database loaded is not supported by the FMS.
LAT DISCONT AHEAD	II	The next leg is a discontinuity and the aircraft is 30 s from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways into the database, and all of the first ten are included in a flight plan or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
LIST OF 99 IN USE	I	The flight crew has tried to store a pilot-defined waypoint when 99 are already in use (in a flight plan or pilot-stored routes).
MACH SEGMENT DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, or engine out is detected or when the flight phase changes from CRZ to another one.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate in order to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy has been downgraded from HIGH to LOW. (See FMGS principles for an explanation).
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy has been upgraded from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has been changed.
NEW CRZ ALT-HHHHH	II	The cruise altitude has been changed.
NEW THR RED ALT-HHHH	II	The thrust reduction altitude has been changed.
NO ANSWER TO REQUEST (ACARS msg)	I	A crew request, was previously sent to the ground and no answer has been received for 4 min.
NO FLS FOR THIS APPR	II	The FMS does not compute any FLS beam for the selected approach. FLS function is not available.
NO INTERSECTION FOUND	I	The system could not find any common waypoint nor intersection point through the airway.
NO SLS FOR THIS APPR	II	An error has been detected on the SLS Final Approach Segment data block.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
NO SLS MAN TUNING	I	The flight crew tries to tune SLS manually.
NO SLS: SBAS DESELECTED	II	SBAS is deselected on the SELECTED NAVAID page while SLS is selected in RADIO NAV page.
NON UNIQUE ROUTE IDENT	I	The flight crew has tried to enter on the new route page a company route IDENT that is identical to an existing company route IDENT (pilot-defined or in the database).
NOT ALLOWED	I	Data entry is not allowed in the selected field, or a selection action is not allowed.
NOT ALLOWED IN NAV	I	An attempt to modify the TO waypoint is made while in NAV mode.
NO NAV INTERCEPT	II	It is triggered, when NAV mode is armed and, no INTERCEPT waypoint exists before the TO waypoint.
NOT IN DATA BASE	I	The pilot is trying to enter or call up a company route IDENT, a FROM/TO pair, a place defined by place-bearing-distance (PBD) or place-bearing/place-bearing (PBX) or an airport NAVAID, waypoint runway, or NAVAID frequency/channel (including pilot-defined elements) that is not in the current database.
NOT XMITTED TO ACARS (ACARS msg)	II	A pilot request or a crew report was sent but the communication was not established or not acknowledged.
ONLY SPD ENTRY ALLOWED	I	The pilot is trying to enter a Mach number for a preselected speed value on the CLIMB page.
OPP FMGC IN PROCESS	II	The offside FMGC is unhealthy, and the FM system mode is SINGLE. The message indicates that the MCDU on which the message is displayed is being driven by the FMGC on the other side.
PAGE UPDATE IN PROCESS	I	The pilot presses a key on the flight plan page while predictions are being updated.
PERF DATA UPLINK (ACARS msg)	II	Performance data are received from ground.
PLACE/D IN TRANSITION	I	If a place/distance waypoint is defined within a pre-planned “fixed turn radius” transition, the entry is rejected and the “PLACE/D IN TRANSITION” scratchpad message is displayed.
PLEASE WAIT	I	Resynchronization between both FMGCs is in progress.
PROCEDURE RNP IS XX.XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the RNP value defined in the navigation database for the active leg or route.
PRINTER NOT AVAILABLE (ACARS msg)	II	A printer communication error has been detected while printing a report. The printing is terminated.
RADIONAV IS DESELECTED	II	Radio navaids have been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
REF/GPS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the GPS position.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
REF/LAST IRS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the last stored IRS position.
REVISIONS NOT STORED	II	This message, displayed when a pilot-defined route or company route (active or secondary flight plan) is stored, indicates that the following elements are not retained: - Pilot-entered holds - Offsets - Modifications to terminal area procedures - Pilot-entered constraints - Pseudo waypoints - Step at optimum.
RTA DELETED	II	A time constraint is automatically deleted: - In case of engine-out - When entering the holding pattern - In case of go-around - At phase transition from descent or approach to climb or cruise - When a time constraint is inserted in the same flight plan at a different waypoint - When the alternate flight plan is activated - When a DIR TO/ABEAM is performed, only if the time constrained waypoint is projected as an ABEAM waypoint - The time constrained waypoint is cleared or sequenced (regardless of active lateral mode) - Valid clock data is lost - The time constraint belongs to the active flight plan and the secondary flight plan is activated - The time constraint belongs to the secondary flight plan and COPY ACTIVE is performed.
RTA EXISTS	I	Displayed if the pilot tries to clear an estimated takeoff time defined by the system.
RTA MISSED AT WPT 01	II	While a time constraint is defined in the active flight plan and this time constraint is predicted as "missed" by the FMS.
RTE DATALINK IN PROG (ACARS msg)	I	A flight plan modification is performed after a F-PLN INIT request has been sent. This message is displayed until the uplink is entirely received.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RWY/LS MISMATCH	II	- During climb, cruise, (ILS or GLS) descent approach, or go-around, the LS frequency entered on the RAD NAV page does not match the LS associated with the destination runway. - During preflight or takeoff, the LS frequency entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SEC RTE UPLINK (ACARS msg)	II	A flight plan is stored in the secondary flight plan.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE sw is set to MAG, while the IRS send true HDG/TRK.
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when the following conditions are all met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to or greater than green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	This instruction appears when the aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, one of these messages is displayed at transitions from climb to cruise, and from climb or cruise to descent. The message is always displayed at the transition to descent from climb or cruise if selected speed is active. It is not displayed if managed speed is active.
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is not available.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VORDME or VORTAC) to be autotuned is invalid.
SPD ERROR AT WPT 01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes to bring the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude and more than 10 kt over green dot or the speed limit (which ever is smaller).
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been automatically deleted.
STORED ROUTES FULL	I	The system already contains five pilot-defined routes. (Only five are allowed.)
T/D REACHED (Also displayed on PFD)	II	One of these messages appears when the aircraft has reached the T/D in managed speed and it has not yet begun the descent.
TAKEOFF DATA UPLINK (ACARS msg)	II	A takeoff data message is received.
TEMPORARY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT) or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
T.O SPEEDS TOO LOW	II	This message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.
TOO STEEP PATH AHEAD	II	The system displays this message in cruise phase if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position because of a manual VOR selection.
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceed the protection envelope defined in the Navigation database.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
UNKNOWN PROGRAM PIN	II	The system has been unable to initialize because of an incompatible or undefined aircraft pin program combination (A/C type, engine type, VMO/MMO parity) in the FMGC software.
UPLINK INSERT IN PROG (ACARS msg)	II	Displayed when an uplink message is currently inserted in the FMGS.
USING COST INDEX-NNN	I	This message is displayed when the system contains a flight plan, and the flight crew tries to enter a zero fuel weight or a gross weight into it before defining a Cost Index (CI). (In this case, the FMS defaults to the Cost Index from the last flight). It is also displayed when the flight crew inserts the ALTN F-PLN (in this case, the FMS defaults the cost index to 0).
V1/VR/V2 DISAGREE	II	This message is displayed when the entered V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.
WAIT FOR SYSTEM RESPONSE	I	During the time between a subsystem selection and the display of the subsystem page, the MCDU MENU page remains displayed with this message.
WIND UPLINK PENDING (ACARS msg)	II	A temporary flight plan exists or a DIR TO page is displayed and a wind uplink is received and stored.
WIND/TEMP DATA UPLK (ACARS msg)	II	Uplink wind message has been received.
WIND/TEMP UPLK EXISTS (ACARS msg)	I	A flight plan modification (active or secondary) is attempted when uplink winds are not inserted yet.
XXXX IS DESELECTED	I	The flight crew attempts to enter a deselected NAVAID, via the SELECTED NAVAID page, that has already been deselected.

MCDU MESSAGE LIST

Ident.: DSC-22_20-50-20-35-00000918.0037001 / 28 NOV 19

2 **Applicable to: MSN 10949-11522, 11572-11597**

Messages displayed on the MCDU are of two types and displayed in two colors.

Type I : A direct result of a pilot action;
Type II : Information about a situation, or a call for pilot action;
Type II messages are stored in a first-in/first-out message queue (5 messages max)
They are suppressed, if correct data is entered or when they no longer apply
The flight crew can clear all messages by pressing the CLEAR key on the MCDU console.
Amber : Important
White : Less important

MESSAGE	TYPE	CONDITIONS
A/C POSITION INVALID	II	The aircraft position has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the aircraft position is still invalid, then the message is displayed again.
ACT RTE UPLINK (ACARS msg)	II	A flight plan is stored in the active flight plan.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the INIT A page is not displayed on either side of the flight deck. The ALIGN IRS message requires that one of the flight crew call up the IRS INIT page, to align the IRS.
ALT CSTR ABOVE CRZ FL	II	This appears when a flight plan altitude constraint has been ignored because the flight crew has inserted a cruise flight level or step-down altitude that is strictly below the flight plan constraint.
AREA RNP IS XX-XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area and when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot entered VIA on the AIRWAYS page does not contain the revised point. If you enter a second airway IDENT, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.
CABIN RATE EXCEEDED	II	This message appears when the aircraft gets within 200 NM of the destination and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.
CHECK ALTN WIND (ACARS msg)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION *EFIS PFD (FMA)	II	Displayed when a NON-ILS or non GLS approach is part of the F-PLN and an ILS/GLS is manually tuned on RAD NAV page. This message reminds the flight crew that available guidance modes for the approach are APP NAV/FINAL. Displayed when in cruise at less than 100 NM from the top of descent or in descent or approach phase.
CHECK CO RTE (ACARS msg)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK IRS/AIRPORT POS	I	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CHECK DEST DATA (ACARS msg)	II	The aircraft is at 180 NM from destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page received by ACARS uplink has to be checked. If a modification of these parameters is performed creating a conflict with previous data, the message is triggered again.
CHECK FLT NBR (ACARS msg)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE sw does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK QFE	II	This appears at the transition from QNH to QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.
CHECK TAKEOFF DATA	II	Following a flight crew entry or modification of one of the take-off parameters, there may be an inconsistency between the take-off runway or the TO shift and V1, VR, V2, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.
CHECK WEIGHT	II	- The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 US tons) (in flight only), or - An active secondary or swap active is performed and the ZFWCG or ZFW of the active F-PLN differs from the ZFWCG or ZFW in SEC F-PLN (before engine start), or - An active secondary or swap active is performed and the ZFW of the active F-PLN differs from the ZFW in SEC F-PLN by more than 5 t (after engine start).
CLK IS TAKEOFF TIME	II	This appears when the flight crew has entered an Estimated Takeoff Time (ETT), and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	Aircraft clock time and GPS time differ by more than XX minutes.
CROSSLOAD ABORTED	II	Message displayed on the transmitting MCDU, indicating an error in the transmission process.
CROSSLOAD COMPLETE	II	The database crossload from one FMGC to the other was successfully completed.
CRZ FL ABOVE MAX FL	II	This appears when the flight crew enters a cruise altitude that is above the computed maximum altitude.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CSTR DEL UP TO WPT 01	II	This appears when constraints get deleted because the aircraft transitions to a go-around flight phase, before the FMGS sequences the flight plan destination.
DELETING OFFSET	II	This appears when the system is deleting an offset automatically, which it does under certain specific conditions, such as: - Change of active leg due to lateral revision. - Termination of next leg at destination runway and the current distance to go is less than or equal to the distance required to reach the path, or the next leg is not a CF, FM or TF leg.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU while the direct to page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is out of the range specified for the selected field.
FLT NBR UPLINK (ACARS msg)	II	A flight number has been added to the uplink flight plan without previous request.
F-PLN ELEMENT RETAINED	I	The flight crew attempts to delete stored NAVAIDs, waypoints or runways that are contained in any flight plan or that are being tuned.
F-PLN FULL	II	There is not enough memory in the flight plan allotment for the computer to accept more flight plan data.
FMS 1/FMS 2 A/C STS DIFF	II	This message always precedes a transition to independent mode, and appears at power-up if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline program pins
FMS 1/FMS 2 GW DIFF	II	Onside and offside aircraft weight differ by 2 t or more.
FMS 1/FMS 2 PGM PIN DIFF	II	Onside and offside program pins are different.
FMS 1/FMS 2 POS DIFF	II	Onside and offside positions differ by 0.5 NM or more (5 NM when GPS is not installed).
FMS 1/FMS 2 SPD TGT DIFF	II	Onside and offside target speeds displayed on the PFD differ by 5 kt or more.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
FMS SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
GPS PRIMARY LOST (also displayed on ND)	II	Displayed when GPS PRIMARY mode is lost.
GPS PRIMARY	II	Displayed when the FMS is transitioning to GPS PRIMARY
GPS IS DESELECTED	II	This message appears when GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHT/CG	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INVALID FLT NBR UPLINK (ACARS msg)	II	The uplink message contains a valid flight plan but no flight number.
INVALID PERF UPLINK (ACARS msg)	II	Performance uplink message has been rejected.
INVALID RTE UPLINK (ACARS msg)	II	An error was detected into the uplink message and it is rejected.
INVALID TAKEOFF UPLINK (ACARS msg)	II	The current uplink takeoff data message is rejected.
INVALID WIND/TEMP UPLK (ACARS msg)	II	The current uplink wind message is rejected.
LARGE NDB NOT ALLOWED	II	The size of the Navigation Database loaded is not supported by the FMS.
LAT DISCONT AHEAD	II	The next leg is a discontinuity and the aircraft is 30 s from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways into the database, and all of the first ten are included in a flight plan or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
LIST OF 99 IN USE	I	The flight crew has tried to store a pilot-defined waypoint when 99 are already in use (in a flight plan or pilot-stored routes).
MACH SEGMENT DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, or engine out is detected or when the flight phase changes from CRZ to another one.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate in order to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy has been downgraded from HIGH to LOW. (See FMGS principles for an explanation).
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy has been upgraded from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has been changed.
NEW CRZ ALT-HHHHH	II	The cruise altitude has been changed.
NEW THR RED ALT-HHHH	II	The thrust reduction altitude has been changed.
NO ANSWER TO REQUEST (ACARS msg)	I	A crew request, was previously sent to the ground and no answer has been received for 4 min.
NO INTERSECTION FOUND	I	The system could not find any common waypoint nor intersection point through the airway.
NON UNIQUE ROUTE IDENT	I	The flight crew has tried to enter on the new route page a company route IDENT that is identical to an existing company route IDENT (pilot-defined or in the database).
NOT ALLOWED	I	Data entry is not allowed in the selected field, or a selection action is not allowed.
NOT ALLOWED IN NAV	I	An attempt to modify the TO waypoint is made while in NAV mode.
NO NAV INTERCEPT	II	It is triggered, when NAV mode is armed and, no INTERCEPT waypoint exists before the TO waypoint.
NOT IN DATA BASE	I	The pilot is trying to enter or call up a company route IDENT, a FROM/TO pair, a place defined by place-bearing-distance (PBD) or place-bearing/place-bearing (PBX) or an airport NAVAID, waypoint runway, or NAVAID frequency/channel (including pilot-defined elements) that is not in the current database.
NOT XMITTED TO ACARS (ACARS msg)	II	A pilot request or a crew report was sent but the communication was not established or not acknowledged.
ONLY SPD ENTRY ALLOWED	I	The pilot is trying to enter a Mach number for a preselected speed value on the CLIMB page.
OPP FMGC IN PROCESS	II	The offside FMGC is unhealthy, and the FM system mode is SINGLE. The message indicates that the MCDU on which the message is displayed is being driven by the FMGC on the other side.
PAGE UPDATE IN PROCESS	I	The pilot presses a key on the flight plan page while predictions are being updated.
PERF DATA UPLINK (ACARS msg)	II	Performance data are received from ground.
PLACE/D IN TRANSITION	I	If a place/distance waypoint is defined within a pre-planned “fixed turn radius” transition, the entry is rejected and the “PLACE/D IN TRANSITION” scratchpad message is displayed.
PLEASE WAIT	I	Resynchronization between both FMGCs is in progress.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
PROCEDURE RNP IS XX.XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the RNP value defined in the navigation database for the active leg or route.
PRINTER NOT AVAILABLE (ACARS msg)	II	A printer communication error has been detected while printing a report. The printing is terminated.
RADIONAV IS DESELECTED	II	Radio navaids have been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
REF/GPS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the GPS position.
REF/LAST IRS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the last stored IRS position.
REVISIONS NOT STORED	II	This message, displayed when a pilot-defined route or company route (active or secondary flight plan) is stored, indicates that the following elements are not retained: - Pilot-entered holds - Offsets - Modifications to terminal area procedures - Pilot-entered constraints - Pseudo waypoints - Step at optimum.
RTA DELETED	II	A time constraint is automatically deleted: - In case of engine-out - When entering the holding pattern - In case of go-around - At phase transition from descent or approach to climb or cruise - When a time constraint is inserted in the same flight plan at a different waypoint - When the alternate flight plan is activated - When a DIR TO/ABEAM is performed, only if the time constrained waypoint is projected as an ABEAM waypoint - The time constrained waypoint is cleared or sequenced (regardless of active lateral mode) - Valid clock data is lost - The time constraint belongs to the active flight plan and the secondary flight plan is activated - The time constraint belongs to the secondary flight plan and COPY ACTIVE is performed.
RTA EXISTS	I	Displayed if the pilot tries to clear an estimated takeoff time defined by the system.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RTA MISSED AT WPT 01	II	While a time constraint is defined in the active flight plan and this time constraint is predicted as "missed" by the FMS.
RTE DATALINK IN PROG (ACARS msg)	I	A flight plan modification is performed after a F-PLN INIT request has been sent. This message is displayed until the uplink is entirely received.
RWY/LS MISMATCH	II	- During climb, cruise, (ILS or GLS) descent approach, or go-around, the LS frequency entered on the RAD NAV page does not match the LS associated with the destination runway. - During preflight or takeoff, the LS frequency entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SEC RTE UPLINK (ACARS msg)	II	A flight plan is stored in the secondary flight plan.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE sw is set to MAG, while the IRS send true HDG/TRK.
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when the following conditions are all met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to or greater than green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	This instruction appears when the aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, one of these messages is displayed at transitions from climb to cruise, and from climb or cruise to descent. The message is always displayed at the transition to descent from climb or cruise if selected speed is active. It is not displayed if managed speed is active.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is not available.
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VORDME or VORTAC) to be autotuned is invalid.
SPD ERROR AT WPT 01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes to bring the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude and more than 10 kt over green dot or the speed limit (which ever is smaller).
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been automatically deleted.
STORED ROUTES FULL	I	The system already contains five pilot-defined routes. (Only five are allowed.)
T/D REACHED (Also displayed on PFD)	II	One of these messages appears when the aircraft has reached the T/D in managed speed and it has not yet begun the descent.
TAKEOFF DATA UPLINK (ACARS msg)	II	A takeoff data message is received.
TEMPORARY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT) or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
T.O SPEEDS TOO LOW	II	This message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.
TOO STEEP PATH AHEAD	II	The system displays this message in cruise phase if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position because of a manual VOR selection.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceed the protection envelope defined in the Navigation database.
UNKNOWN PROGRAM PIN	II	The system has been unable to initialize because of an incompatible or undefined aircraft pin program combination (A/C type, engine type, VMO/MMO parity) in the FMGC software.
UPLINK INSERT IN PROG (ACARS msg)	II	Displayed when an uplink message is currently inserted in the FMGS.
USING COST INDEX-NNN	I	This message is displayed when the system contains a flight plan, and the flight crew tries to enter a zero fuel weight or a gross weight into it before defining a Cost Index (CI). (In this case, the FMS defaults to the Cost Index from the last flight). It is also displayed when the flight crew inserts the ALTN F-PLN (in this case, the FMS defaults the cost index to 0).
V1/VR/V2 DISAGREE	II	This message is displayed when the entered V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.
WAIT FOR SYSTEM RESPONSE	I	During the time between a subsystem selection and the display of the subsystem page, the MCDU MENU page remains displayed with this message.
WIND UPLINK PENDING (ACARS msg)	II	A temporary flight plan exists or a DIR TO page is displayed and a wind uplink is received and stored.
WIND/TEMP DATA UPLK (ACARS msg)	II	Uplink wind message has been received.
WIND/TEMP UPLK EXISTS (ACARS msg)	I	A flight plan modification (active or secondary) is attempted when uplink winds are not inserted yet.
XXXX IS DESELECTED	I	The flight crew attempts to enter a deselected NAVAID, via the SELECTED NAVAID page, that has already been deselected.

MCDU MESSAGE LIST

Ident.: DSC-22_20-50-20-35-00000918.0034001 / 28 NOV 19
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

Messages displayed on the MCDU are of two types and displayed in two colors.

Type I : A direct result of a pilot action;
Type II : Information about a situation, or a call for pilot action;
Type II messages are stored in a first-in/first-out message queue (5 messages max)
They are suppressed, if correct data is entered or when they no longer apply
The flight crew can clear all messages by pressing the CLEAR key on the MCDU console.
Amber : Important
White : Less important

MESSAGE	TYPE	CONDITIONS
A/C POSITION INVALID	II	The aircraft position has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the aircraft position is still invalid, then the message is displayed again.
ACT RTE UPLINK (ACARS msg)	II	A flight plan is stored in the active flight plan.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the INIT A page is not displayed on either side of the flight deck. The ALIGN IRS message requires that one of the flight crew call up the IRS INIT page, to align the IRS.
AREA RNP IS XX-XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area and when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot entered VIA on the AIRWAYS page does not contain the revised point. If you enter a second airway IDENT, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.
CABIN RATE EXCEEDED	II	This message appears when the aircraft gets within 200 NM of the destination and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.
CHECK ALTN WIND (ACARS msg)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION *EFIS PFD (FMA)	II	Displayed when a NON-ILS or non GLS approach is part of the F-PLN and an ILS/GLS is manually tuned on RAD NAV page. This message reminds the flight crew that available guidance modes for the approach are APP NAV/FINAL. Displayed when in cruise at less than 100 NM from the top of descent or in descent or approach phase.
CHECK CO RTE (ACARS msg)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK IRS/AIRPORT POS	I	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM

MESSAGE	TYPE	CONDITIONS
CHECK DEST DATA (ACARS msg)	II	The aircraft is at 180 NM from destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page received by ACARS uplink has to be checked. If a modification of these parameters is performed creating a conflict with previous data, the message is triggered again.
CHECK FLT NBR (ACARS msg)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE sw does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK QFE	II	This appears at the transition from QNH to QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.
CHECK TAKEOFF DATA	II	Following a flight crew entry or modification of one of the take-off parameters, there may be an inconsistency between the take-off runway or the TO shift and V1, VR, V2, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.
CHECK WEIGHT	II	The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 US tons).
CLK IS TAKEOFF TIME	II	This appears when the flight crew has entered an Estimated Takeoff Time (ETT), and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	Aircraft clock time and GPS time differ by more than XX minutes.
CROSSLOAD ABORTED	II	Message displayed on the transmitting MCDU, indicating an error in the transmission process.
CROSSLOAD COMPLETE	II	The database crossload from one FMGC to the other was successfully completed.
CRZ FL ABOVE MAX FL	II	This appears when the flight crew enters a cruise altitude that is above the computed maximum altitude.
CSTR DEL ABOVE CRZ FL	II	This appears when a flight plan altitude constraint has been deleted because the flight crew has inserted a cruise flight level, or step-down altitude that is at or below the flight plan constraint.
CSTR DEL UP TO WPT 01	II	This appears when constraints get deleted because the aircraft transitions to a go-around flight phase, before the FMGS sequences the flight plan destination.

MESSAGE	TYPE	CONDITIONS
DECELERATE or T/D REACHED (Also displayed on PFD)	II	One of these messages appears when the aircraft has reached the T/D in managed speed and it has not yet begun the descent.
DELETING OFFSET	II	This appears when the system is deleting an offset automatically, which it does under certain specific conditions, such as: - Change of active leg due to lateral revision. - Termination of next leg at destination runway and the current distance to go is less than or equal to the distance required to reach the path, or the next leg is not a CF, FM or TF leg.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU while the direct to page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is out of the range specified for the selected field.
FLT NBR UPLINK (ACARS msg)	II	A flight number has been added to the uplink flight plan without previous request.
F-PLN ELEMENT RETAINED	I	The flight crew attempts to delete stored NAVAIDs, waypoints or runways that are contained in any flight plan or that are being tuned.
F-PLN FULL	II	There is not enough memory in the flight plan allotment for the computer to accept more flight plan data.
FMS 1/FMS 2 A/C STS DIFF	II	This message always precedes a transition to independent mode, and appears at power-up if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline program pins
FMS 1/FMS 2 GW DIFF	II	Onside and offside aircraft weight differ by 2 t or more.
FMS 1/FMS 2 PGM PIN DIFF	II	Onside and offside program pins are different.
FMS 1/FMS 2 POS DIFF	II	Onside and offside positions differ by 0.5 NM or more (5 NM when GPS is not installed).
FMS 1/FMS 2 SPD TGT DIFF	II	Onside and offside target speeds displayed on the PFD differ by 5 kt or more.

MESSAGE	TYPE	CONDITIONS
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
GPS PRIMARY LOST (also displayed on ND)	II	Displayed when GPS PRIMARY mode is lost.
GPS PRIMARY	II	Displayed when the FMS is transitioning to GPS PRIMARY
GPS IS DESELECTED	II	This message appears when GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHT/CG	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INVALID FLT NBR UPLINK (ACARS msg)	II	The uplink message contains a valid flight plan but no flight number.
INVALID PERF UPLINK (ACARS msg)	II	Performance uplink message has been rejected.
INVALID RTE UPLINK (ACARS msg)	II	An error was detected into the uplink message and it is rejected.
INVALID TAKEOFF UPLINK (ACARS msg)	II	The current uplink takeoff data message is rejected.
INVALID WIND UPLINK (ACARS msg)	II	The current uplink wind message is rejected.
LAT DISCONT AHEAD	II	The next leg is a discontinuity and the aircraft is 30 s from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways into the database, and all of the first ten are included in a flight plan or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a PBD, LAT/LONG, or PBX, or store a pilot-defined waypoint or NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
MACH SEGMENT DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, or engine out is detected or when the flight phase changes from CRZ to another one.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate in order to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy has been downgraded from HIGH to LOW. (See FMGS principles for an explanation).
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy has been upgraded from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has been changed.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
NEW CRZ ALT-HHHHH	II	The cruise altitude has been changed.
NEW THR RED ALT-HHHH	II	The thrust reduction altitude has been changed.
NO ANSWER TO REQUEST (ACARS msg)	I	A crew request, was previously sent to the ground and no answer has been received for 4 min.
NO INTERSECTION FOUND	I	The system could not find any common waypoint nor intersection point through the airway.
NON UNIQUE ROUTE IDENT	I	The flight crew has tried to enter on the new route page a company route IDENT that is identical to an existing company route IDENT (pilot-defined or in the database).
NOT ALLOWED	I	Data entry is not allowed in the selected field, or a selection action is not allowed.
NOT ALLOWED IN NAV	I	An attempt to modify the TO waypoint is made while in NAV mode.
NO NAV INTERCEPT	II	It is triggered, when NAV mode is armed and, no INTERCEPT waypoint exists before the TO waypoint.
NOT IN DATA BASE	I	The pilot is trying to enter or call up a company route IDENT, a FROM/TO pair, a place defined by place-bearing-distance (PBD) or place-bearing/place-bearing (PBX) or an airport NAVAID, waypoint runway, or NAVAID frequency/channel (including pilot-defined elements) that is not in the current database.
NOT XMITTED TO ACARS (ACARS msg)	II	A pilot request or a crew report was sent but the communication was not established or not acknowledged.
ONLY SPD ENTRY ALLOWED	I	The pilot is trying to enter a Mach number for a preselected speed value on the CLIMB page.
OPP FMGC IN PROCESS	II	The offside FMGC is unhealthy, and the FM system mode is SINGLE. The message indicates that the MCDU on which the message is displayed is being driven by the FMGC on the other side.
PAGE UPDATE IN PROCESS	I	The pilot presses a key on the flight plan page while predictions are being updated.
PERF DATA UPLINK (ACARS msg)	II	Performance data are received from ground.
PLACE/D IN TRANSITION	I	If a place/distance waypoint is defined within a pre-planned “fixed turn radius” transition, the entry is rejected and the “PLACE/D IN TRANSITION” scratchpad message is displayed.
PLEASE WAIT	I	Resynchronization between both FMGCs is in progress.
PROCEDURE RNP IS XX.XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the RNP value defined in the navigation database for the active leg or route.
PRINTER NOT AVAILABLE (ACARS msg)	II	A printer communication error has been detected while printing a report. The printing is terminated.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RADIONAV IS DESELECTED	II	Radio navaids have been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
REF/GPS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the GPS position.
REF/LAST IRS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the last stored IRS position.
REVISIONS NOT STORED	II	This message, displayed when a pilot-defined route or company route (active or secondary flight plan) is stored, indicates that the following elements are not retained: - Pilot-entered holds - Offsets - Modifications to terminal area procedures - Pilot-entered constraints - Pseudo waypoints - Step at optimum.
RTA DELETED	II	A time constraint is automatically deleted: - In case of engine-out - When entering the holding pattern - In case of go-around - At phase transition from descent or approach to climb or cruise - When a time constraint is inserted in the same flight plan at a different waypoint - When the alternate flight plan is activated - When a DIR TO/ABEAM is performed, only if the time constrained waypoint is projected as an ABEAM waypoint - The time constrained waypoint is cleared or sequenced (regardless of active lateral mode) - Valid clock data is lost - The time constraint belongs to the active flight plan and the secondary flight plan is activated - The time constraint belongs to the secondary flight plan and COPY ACTIVE is performed.
RTA EXISTS	I	Displayed if the pilot tries to clear an estimated takeoff time defined by the system.
RTE DATALINK IN PROG (ACARS msg)	I	A flight plan modification is performed after a F-PLN INIT request has been sent. This message is displayed until the uplink is entirely received.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RWY/LS MISMATCH	II	- During climb, cruise, (ILS or GLS) descent approach, or go-around, the LS frequency entered on the RAD NAV page does not match the LS associated with the destination runway. - During preflight or takeoff, the LS frequency entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SEC RTE UPLINK (ACARS msg)	II	A flight plan is stored in the secondary flight plan.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE sw is set to MAG, while the IRS send true HDG/TRK.
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when the following conditions are all met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to or greater than green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	This instruction appears when the aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, one of these messages is displayed at transitions from climb to cruise, and from climb or cruise to descent. The message is always displayed at the transition to descent from climb or cruise if selected speed is active. It is not displayed if managed speed is active.
SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is not available.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VORDME or VORTAC) to be autotuned is invalid.
SPD ERROR AT WPT 01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes to bring the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude and more than 10 kt over green dot or the speed limit (which ever is smaller).
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been automatically deleted.
STORED ROUTES FULL	I	The system already contains five pilot-defined routes. (Only five are allowed.)
TAKEOFF DATA UPLINK (ACARS msg)	II	A takeoff data message is received.
TEMPORARY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT) or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME ERROR AT WPT 01	II	While the aircraft is in lateral managed flight the FMGC predicts that it will miss a time constraint.
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
TO SPEED TOO LOW	II	This message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.
TOO STEEP PATH AHEAD	II	The system displays this message in cruise phase if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position because of a manual VOR selection.
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceed the protection envelope defined in the Navigation database.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
UNKNOWN PROGRAM PIN	II	The system has been unable to initialize because of an incompatible or undefined aircraft pin program combination (A/C type, engine type, VMO/MMO parity) in the FMGC software.
UPLINK INSERT IN PROG (ACARS msg)	II	Displayed when an uplink message is currently inserted in the FMGS.
USING COST INDEX-NNN	I	This message is displayed when the system contains a flight plan, and the flight crew tries to enter a zero fuel weight or a gross weight into it before defining a Cost Index (CI). (In this case, the FMS defaults to the Cost Index from the last flight). It is also displayed when the flight crew inserts the ALTN F-PLN (in this case, the FMS defaults the cost index to 0).
V1/VR/V2 DISAGREE	II	This message is displayed when the entered V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.
WAIT FOR SYSTEM RESPONSE	I	During the time between a subsystem selection and the display of the subsystem page, the MCDU MENU page remains displayed with this message.
WIND DATA UPLINK (ACARS msg)	II	Uplink wind message has been received.
WIND UPLINK EXISTS (ACARS msg)	I	A flight plan modification (active or secondary) is attempted when uplink winds are not inserted yet.
WIND UPLINK PENDING (ACARS msg)	II	A temporary flight plan exists or a DIR TO page is displayed and a wind uplink is received and stored.
XXXX IS DESELECTED	I	The flight crew attempts to enter a deselected NAVAID, via the SELECTED NAVAID page, that has already been deselected.

MCDU MESSAGE LIST

Ident.: DSC-22_20-50-20-35-00000918.0020001 / 28 NOV 19
Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324

Messages displayed on the MCDU are of two types and displayed in two colors.

Type I : A direct result of a pilot action;
Type II : Information about a situation, or a call for pilot action;

Type II messages are stored in a first-in/first-out message queue (5 messages max)
They are suppressed, if correct data is entered or when they no longer apply
The flight crew can clear all messages by pressing the CLEAR key on the MCDU console.

Amber : Important
White : Less important

MESSAGE	TYPE	CONDITIONS
A/C POSITION INVALID	II	The aircraft position has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the aircraft position is still invalid, then the message is displayed again.
ACT RTE UPLINK (ACARS msg)	II	A flight plan is stored in the active flight plan.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the INIT A page is not displayed on either side of the flight deck. The ALIGN IRS message requires that one of the flight crew call up the IRS INIT page, to align the IRS.
AREA RNP IS XX-XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area and when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot entered VIA on the AIRWAYS page does not contain the revised point. If you enter a second airway IDENT, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.
CABIN RATE EXCEEDED	II	This message appears when the aircraft gets within 200 NM of the destination and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.
CHECK ALTN WIND (ACARS msg)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION *EFIS PFD (FMA)	II	Displayed when a NON ILS approach is part of the F-PLN and an ILS is manually tuned on RAD NAV page. This message reminds the flight crew that available guidance modes for the approach are APP NAV/FINAL. Displayed when in cruise at less than 100 NM from the top of descent or in descent or approach phase.
CHECK CO RTE (ACARS msg)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK IRS/AIRPORT POS	I	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CHECK DEST DATA (ACARS msg)	II	The aircraft is at 180 NM from destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page received by ACARS uplink has to be checked. If a modification of these parameters is performed creating a conflict with previous data, the message is triggered again.
CHECK FLT NBR (ACARS msg)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE sw does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK QFE	II	This appears at the transition from QNH to QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.
CHECK TAKEOFF DATA	II	Following a flight crew entry or modification of one of the take-off parameters, there may be an inconsistency between the take-off runway or the TO shift and V1, VR, V2, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.
CHECK WEIGHT	II	The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 US tons).
CLK IS TAKEOFF TIME	II	This appears when the flight crew has entered an Estimated Takeoff Time (ETT), and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	Aircraft clock time and GPS time differ by more than XX minutes.
CROSSLOAD ABORTED	II	Message displayed on the transmitting MCDU, indicating an error in the transmission process.
CROSSLOAD COMPLETE	II	The database crossload from one FMGC to the other was successfully completed.
CRZ FL ABOVE MAX FL	II	This appears when the flight crew enters a cruise altitude that is above the computed maximum altitude.
CSTR DEL ABOVE CRZ FL	II	This appears when a flight plan altitude constraint has been deleted because the flight crew has inserted a cruise flight level, or step-down altitude that is at or below the flight plan constraint.
CSTR DEL UP TO WPT 01	II	This appears when constraints get deleted because the aircraft transitions to a go-around flight phase, before the FMGS sequences the flight plan destination.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
DECELERATE or T/D REACHED (Also displayed on PFD)	II	One of these messages appears when the aircraft has reached the T/D in managed speed and it has not yet begun the descent.
DELETING OFFSET	II	This appears when the system is deleting an offset automatically, which it does under certain specific conditions, such as: - Change of active leg due to lateral revision. - Termination of next leg at destination runway and the current distance to go is less than or equal to the distance required to reach the path, or the next leg is not a CF, FM or TF leg.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU while the direct to page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is out of the range specified for the selected field.
FLT NBR UPLINK (ACARS msg)	II	A flight number has been added to the uplink flight plan without previous request.
F-PLN ELEMENT RETAINED	I	The flight crew attempts to delete stored NAVAIDs, waypoints or runways that are contained in any flight plan or that are being tuned.
F-PLN FULL	II	There is not enough memory in the flight plan allotment for the computer to accept more flight plan data.
FMS 1/FMS 2 A/C STS DIFF	II	This message always precedes a transition to independent mode, and appears at power-up if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline program pins
FMS 1/FMS 2 GW DIFF	II	Onside and offside aircraft weight differ by 2 t or more.
FMS 1/FMS 2 PGM PIN DIFF	II	Onside and offside program pins are different.
FMS 1/FMS 2 POS DIFF	II	Onside and offside positions differ by 0.5 NM or more (5 NM when GPS is not installed).
FMS 1/FMS 2 SPD TGT DIFF	II	Onside and offside target speeds displayed on the PFD differ by 5 kt or more.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
GPS PRIMARY LOST (also displayed on ND)	II	Displayed when GPS PRIMARY mode is lost.
GPS PRIMARY	II	Displayed when the FMS is transitioning to GPS PRIMARY
GPS IS DESELECTED	II	This message appears when GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHT/CG	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INVALID FLT NBR UPLINK (ACARS msg)	II	The uplink message contains a valid flight plan but no flight number.
INVALID PERF UPLINK (ACARS msg)	II	Performance uplink message has been rejected.
INVALID RTE UPLINK (ACARS msg)	II	An error was detected into the uplink message and it is rejected.
INVALID TAKEOFF UPLINK (ACARS msg)	II	The current uplink takeoff data message is rejected.
INVALID WIND UPLINK (ACARS msg)	II	The current uplink wind message is rejected.
LAT DISCONT AHEAD	II	The next leg is a discontinuity and the aircraft is 30 s from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways into the database, and all of the first ten are included in a flight plan or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a PBD, LAT/LONG, or PBX, or store a pilot-defined waypoint or NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
MACH SEGMENT DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, or engine out is detected or when the flight phase changes from CRZ to another one.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate in order to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy has been downgraded from HIGH to LOW. (See FMGS principles for an explanation).
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy has been upgraded from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has been changed.

MESSAGE	TYPE	CONDITIONS
RWY/LS MISMATCH	II	- During climb, cruise, (ILS or MLS) descent approach, or go-around, the LS frequency entered on the RAD NAV page does not match the LS associated with the destination runway. - During preflight or takeoff, the LS frequency entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SEC RTE UPLINK (ACARS msg)	II	A flight plan is stored in the secondary flight plan.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE sw is set to MAG, while the IRS send true HDG/TRK.
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when the following conditions are all met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to or greater than green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	This instruction appears when the aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, one of these messages is displayed at transitions from climb to cruise, and from climb or cruise to descent. The message is always displayed at the transition to descent from climb or cruise if selected speed is active. It is not displayed if managed speed is active.
SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is not available.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VORDME or VORTAC) to be autotuned is invalid.
SPD ERROR AT WPT 01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes to bring the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude and more than 10 kt over green dot or the speed limit (which ever is smaller).
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been automatically deleted.
STORED ROUTES FULL	I	The system already contains five pilot-defined routes. (Only five are allowed.)
TAKEOFF DATA UPLINK (ACARS msg)	II	A takeoff data message is received.
TEMPORARY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT) or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME ERROR AT WPT 01	II	While the aircraft is in lateral managed flight the FMGC predicts that it will miss a time constraint.
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
TO SPEED TOO LOW	II	This message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.
TOO STEEP PATH AHEAD	II	The system displays this message in cruise phase if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position because of a manual VOR selection.
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceed the protection envelope defined in the Navigation database.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
UNKNOWN PROGRAM PIN	II	The system has been unable to initialize because of an incompatible or undefined aircraft pin program combination (A/C type, engine type, VMO/MMO parity) in the FMGC software.
UPLINK INSERT IN PROG (ACARS msg)	II	Displayed when an uplink message is currently inserted in the FMGS.
USING COST INDEX-NNN	I	This message is displayed when the system contains a flight plan, and the flight crew tries to enter a zero fuel weight or a gross weight into it before defining a Cost Index (CI). (In this case, the FMS defaults to the Cost Index from the last flight). It is also displayed when the flight crew inserts the ALTN F-PLN (in this case, the FMS defaults the cost index to 0).
V1/VR/V2 DISAGREE	II	This message is displayed when the entered V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2.
WAIT FOR SYSTEM RESPONSE	I	During the time between a subsystem selection and the display of the subsystem page, the MCDU MENU page remains displayed with this message.
WIND DATA UPLINK (ACARS msg)	II	Uplink wind message has been received.
WIND UPLINK EXISTS (ACARS msg)	I	A flight plan modification (active or secondary) is attempted when uplink winds are not inserted yet.
WIND UPLINK PENDING (ACARS msg)	II	A temporary flight plan exists or a DIR TO page is displayed and a wind uplink is received and stored.
XXXX IS DESELECTED	I	The flight crew attempts to enter a deselected NAVAID, via the SELECTED NAVAID page, that has already been deselected.

MCDU MESSAGE LIST

Ident.: DSC-22_20-50-20-35-00000918.0009001 / 28 NOV 19
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Messages displayed on the MCDU are of two types and displayed in two colors.

Type I : A direct result of a pilot action;

Type II : Information about a situation, or a call for pilot action;

Type II messages are stored in a first-in/first-out message queue (5 messages max)

They are suppressed, if correct data is entered or when they no longer apply

The flight crew can clear all messages by pressing the CLEAR key on the MCDU console.

Amber : Important

White : Less important

MESSAGE	TYPE	CONDITIONS
A/C POSITION INVALID	II	The aircraft position has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the aircraft position is still invalid, then the message is displayed again.
ACT RTE UPLINK (ACARS msg)	II	A flight plan is stored in the active flight plan.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the INIT A page is not displayed on either side of the flight deck. The ALIGN IRS message requires that one of the flight crew call up the IRS INIT page, to align the IRS.
AREA RNP IS XX-XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area and when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot entered VIA on the AIRWAYS page does not contain the revised point. If you enter a second airway IDENT, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.
CABIN RATE EXCEEDED	II	This message appears when the aircraft gets within 200 NM of the destination and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.
CHECK ALTN WIND (ACARS msg)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION (On PFD: CHECK APP GUIDANCE or CHECK APP SEL (if CPIP3 ◁*)	II	Displayed when a NON ILS approach is part of the F-PLN and an ILS is manually tuned on RAD NAV page. This message reminds the flight crew that available guidance modes for the approach are APP NAV/FINAL. Displayed when in cruise at less than 100 NM from the top of descent or in descent or approach phase.
CHECK CO RTE (ACARS msg)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK IRS/AIRPORT POS	I	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
CHECK DEST DATA (ACARS msg)	II	The aircraft is at 180 NM from destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page received by ACARS uplink has to be checked. If a modification of these parameters is performed creating a conflict with previous data, the message is triggered again.
CHECK FLT NBR (ACARS msg)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE sw does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK QFE	II	This appears at the transition from QNH to QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.
CHECK TAKEOFF DATA	II	Following a flight crew entry or modification of one of the take-off parameters, there may be an inconsistency between the take-off runway or the TO shift and V1, VR, V2, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.
CHECK WEIGHT	II	The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 US tons).
CLK IS TAKEOFF TIME	II	This appears when the flight crew has entered an Estimated Takeoff Time (ETT), and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	Aircraft clock time and GPS time differ by more than XX minutes.
CROSSLOAD ABORTED	II	Message displayed on the transmitting MCDU, indicating an error in the transmission process.
CROSSLOAD COMPLETE	II	The database crossload from one FMGC to the other was successfully completed.
CRZ FL ABOVE MAX FL	II	This appears when the flight crew enters a cruise altitude that is above the computed maximum altitude.
CSTR DEL ABOVE CRZ FL	II	This appears when a flight plan altitude constraint has been deleted because the flight crew has inserted a cruise flight level, or step-down altitude that is at or below the flight plan constraint.
CSTR DEL UP TO WPT 01	II	This appears when constraints get deleted because the aircraft transitions to a go-around flight phase, before the FMGS sequences the flight plan destination.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
DECELERATE or T/D REACHED (Also displayed on PFD)	II	One of these messages appears when the aircraft has reached the T/D in managed speed and it has not yet begun the descent.
DELETING OFFSET	II	This appears when the system is deleting an offset automatically, which it does under certain specific conditions, such as: - Change of active leg due to lateral revision. - Termination of next leg at destination runway and the current distance to go is less than or equal to the distance required to reach the path, or the next leg is not a CF, FM or TF leg.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU while the direct to page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is out of the range specified for the selected field.
FLT NBR UPLINK (ACARS msg)	II	A flight number has been added to the uplink flight plan without previous request.
F-PLN ELEMENT RETAINED	I	The flight crew attempts to delete stored NAVAIDs, waypoints or runways that are contained in any flight plan or that are being tuned.
F-PLN FULL	II	There is not enough memory in the flight plan allotment for the computer to accept more flight plan data.
FMS 1/FMS 2 A/C STS DIFF	II	This message always precedes a transition to independent mode, and appears at power-up if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline program pins
FMS 1/FMS 2 GW DIFF	II	Onside and offside aircraft weight differ by 2 t or more.
FMS 1/FMS 2 PGM PIN DIFF	II	Onside and offside program pins are different.
FMS 1/FMS 2 POS DIFF	II	Onside and offside positions differ by 0.5 NM or more (5 NM when GPS is not installed).
FMS 1/FMS 2 SPD TGT DIFF	II	Onside and offside target speeds displayed on the PFD differ by 5 kt or more.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
GPS PRIMARY LOST (also displayed on ND)	II	Displayed when GPS PRIMARY mode is lost.
GPS PRIMARY	II	Displayed when the FMS is transitioning to GPS PRIMARY
GPS IS DESELECTED	II	This message appears when GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHT/CG	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INVALID FLT NBR UPLINK (ACARS msg)	II	The uplink message contains a valid flight plan but no flight number.
INVALID PERF UPLINK (ACARS msg)	II	Performance uplink message has been rejected.
INVALID RTE UPLINK (ACARS msg)	II	An error was detected into the uplink message and it is rejected.
INVALID TAKEOFF UPLINK (ACARS msg)	II	The current uplink takeoff data message is rejected.
INVALID WIND UPLINK (ACARS msg)	II	The current uplink wind message is rejected.
LAT DISCONT AHEAD	II	The next leg is a discontinuity and the aircraft is 30 s from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways into the database, and all of the first ten are included in a flight plan or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a PBD, LAT/LONG, or PBX, or store a pilot-defined waypoint or NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
MACH SEGMENT DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, or engine out is detected or when the flight phase changes from CRZ to another one.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate in order to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy has been downgraded from HIGH to LOW. (See FMGS principles for an explanation).
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy has been upgraded from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has been changed.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
NEW CRZ ALT-HHHHH	II	The cruise altitude has been changed.
NEW THR RED ALT-HHHH	II	The thrust reduction altitude has been changed.
NO ANSWER TO REQUEST (ACARS msg)	I	A crew request, was previously sent to the ground and no answer has been received for 4 min.
NO INTERSECTION FOUND	I	The system could not find any common waypoint nor intersection point through the airway.
NON UNIQUE ROUTE IDENT	I	The flight crew has tried to enter on the new route page a company route IDENT that is identical to an existing company route IDENT (pilot-defined or in the database).
NOT ALLOWED	I	Data entry is not allowed in the selected field, or a selection action is not allowed.
NOT ALLOWED IN NAV	I	An attempt to modify the TO waypoint is made while in NAV mode.
NO NAV INTERCEPT	II	It is triggered, when NAV mode is armed and, no INTERCEPT waypoint exists before the TO waypoint.
NOT IN DATA BASE	I	The pilot is trying to enter or call up a company route IDENT, a FROM/TO pair, a place defined by place-bearing-distance (PBD) or place-bearing/place-bearing (PBX) or an airport NAVAID, waypoint runway, or NAVAID frequency (including pilot-defined elements) that is not in the current database.
NOT XMITTED TO ACARS (ACARS msg)	II	A pilot request or a crew report was sent but the communication was not established or not acknowledged.
ONLY SPD ENTRY ALLOWED	I	The pilot is trying to enter a Mach number for a preselected speed value on the CLIMB page.
OPP FMGC IN PROCESS	II	The offside FMGC is unhealthy, and the FM system mode is SINGLE. The message indicates that the MCDU on which the message is displayed is being driven by the FMGC on the other side.
PAGE UPDATE IN PROCESS	I	The pilot presses a key on the flight plan page while predictions are being updated.
PERF DATA UPLINK (ACARS msg)	II	Performance data are received from ground.
PLACE/D IN TRANSITION	I	If a place/distance waypoint is defined within a pre-planned “fixed turn radius” transition, the entry is rejected and the “PLACE/D IN TRANSITION” scratchpad message is displayed.
PLEASE WAIT	I	Resynchronization between both FMGCs is in progress.
PROCEDURE RNP IS XX.XX	II	Displayed when the RNP value, manually-entered on the PROG page, is larger than the RNP value defined in the navigation database for the active leg or route.
PRINTER NOT AVAILABLE (ACARS msg)	II	A printer communication error has been detected while printing a report. The printing is terminated.

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RADIONAV IS DESELECTED	II	Radio navaids have been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
REF/GPS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the GPS position.
REF/LAST IRS POS DIFF	I	This message is displayed when there is a discrepancy between the reference position entered by the pilot and the last stored IRS position.
REVISIONS NOT STORED	II	This message, displayed when a pilot-defined route or company route (active or secondary flight plan) is stored, indicates that the following elements are not retained: - Pilot-entered holds - Offsets - Modifications to terminal area procedures - Pilot-entered constraints - Pseudo waypoints - Step at optimum.
RTA DELETED	II	A time constraint is automatically deleted: - In case of engine-out - When entering the holding pattern - In case of go-around - At phase transition from descent or approach to climb or cruise - When a time constraint is inserted in the same flight plan at a different waypoint - When the alternate flight plan is activated - When a DIR TO/ABEAM is performed, only if the time constrained waypoint is projected as an ABEAM waypoint - The time constrained waypoint is cleared or sequenced (regardless of active lateral mode) - Valid clock data is lost - The time constraint belongs to the active flight plan and the secondary flight plan is activated - The time constraint belongs to the secondary flight plan and COPY ACTIVE is performed.
RTA EXISTS	I	Displayed if the pilot tries to clear an estimated takeoff time defined by the system.
RTE DATALINK IN PROG (ACARS msg)	I	A flight plan modification is performed after a F-PLN INIT request has been sent. This message is displayed until the uplink is entirely received.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
RWY/LS MISMATCH	II	- During climb, cruise, (ILS or MLS) descent approach, or go-around, the LS frequency entered on the RAD NAV page does not match the LS associated with the destination runway. - During preflight or takeoff, the LS frequency entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SEC RTE UPLINK (ACARS msg)	II	A flight plan is stored in the secondary flight plan.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE sw is set to MAG, while the IRS send true HDG/TRK.
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when the following conditions are all met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to or greater than green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	This instruction appears when the aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, one of these messages is displayed at transitions from climb to cruise, and from climb or cruise to descent. The message is always displayed at the transition to descent from climb or cruise if selected speed is active. It is not displayed if managed speed is active.
SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is not available.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE	CONDITIONS
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VORDME or VORTAC) to be autotuned is invalid.
SPD ERROR AT WPT 01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes to bring the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude and more than 10 kt over green dot or the speed limit (which ever is smaller).
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been automatically deleted.
STORED ROUTES FULL	I	The system already contains five pilot-defined routes. (Only five are allowed.)
TAKEOFF DATA UPLINK (ACARS msg)	II	A takeoff data message is received.
TEMPORARY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT) or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME ERROR AT WPT 01	II	While the aircraft is in lateral managed flight the FMGC predicts that it will miss a time constraint.
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
TO SPEED TOO LOW	II	This message appears if the inserted V1, VR, V2 speeds do not satisfy the existing regulatory conditions regarding VMCG/VMCA and VS1G speeds.
TOO STEEP PATH AHEAD	II	The system displays this message in cruise phase if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position because of a manual VOR selection.
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceed the protection envelope defined in the Navigation database.

MCDU MESSAGE LIST

Ident.: DSC-22_20-50-20-38-00000919.0070001 / 28 NOV 19
Applicable to: MSN 04827-04860

The MCDU displays two types in two colors:

Type I : Direct result of a pilot action;
Type II : Information about a situation, or a call for pilot action;

Type II messages are stored in a first-in/first-out message queue (5 messages MAX).
They are suppressed, if correct data is entered or when they no longer apply.
The flight crew can clear all messages by pressing the MCDU's CLEAR key.

Amber : Important
White : Less important

MESSAGE	TYPE/COLOR	CONDITIONS
ABEAM POINTS LIST FULL	II	It is displayed when the number of abeam points exceeds 50, which is the maximum number allowed.
A/C POSITION INVALID	II	The position of the aircraft has become invalid. If the message has been cleared and the flight crew attempts to call up the HOLD at PPOS or DIR TO page while the position of the aircraft is still invalid, the message will reappear.
ALIGN IRS	II	Appears when the IRS are ready for alignment, but the IRS INIT page is not displayed on either MCDU. The ALIGN IRS message requires that one flight crew member call up the IRS INIT page, to align the IRS.
ALTN F-PLN DELETED	II	The Alternate F-PLN has been automatically deleted. This occurs when the F-PLN memory is full, and the system attempts to free up some space.
AOC XXXF-PLN UPLINK (ACARS MSG)	II	A flight plan is stored in the active or secondary flight plan. XXX is 'ACT' or 'SEC'.
AREA RNP IS XX-XX	II	It is displayed when: The RNP value, manually-entered on the PROG page, is larger than the default RNP value associated to the current flight area; and, when there is no RNP value defined in the navigation database for the active leg or route.
AWY/WPT MISMATCH	I	The pilot-entered VIA on the AIRWAYS page does not contain the revised point. If a second airway IDENT is entered, it must contain the first airway ending point.
BLOCK IGNORES RTA	II	A time constraint existing at initiation of flight planning, or an entry of a time constraint made after initiation of flight planning, are ignored by the fuel planning function.

MESSAGE	TYPE/COLOR	CONDITIONS
CABIN RATE EXCEEDED	II	The aircraft is within 200 NM of its destination, and the computed rate of descent makes it impossible for the cabin to be repressurized at the maximum rate.
CHECK ALTN WIND (ACARS MSG)	II	The uplinked alternate cruise flight level differs from the defaulted alternate cruise flight level.
CHECK APPR SELECTION (On PFD: CHECK APP GUIDANCE or CHECK APP SEL (if CPIP3 ◁✱)	II	A non ILS/GLS approach is part of the F-PLN and an ILS/GLS is manually-tuned on the RAD NAV page. It reminds the flight crew that APP NAV/FINAL are the available guidance modes for the approach. Displayed when in cruise at less than 100 NM from the top of descent, or in descent, or approach phase.
CHECK CO RTE (AOC MSG)	II	The uplinked company route identifier differs from the one specified in the request.
CHECK DATA BASE CYCLE	II	The current date does not match the effective date of the active database, and someone attempts to enter a FROM/TO or CO RTE.
CHECK DEST DATA (AOC MSG)	II	The aircraft is 180 NM from its destination and the destination QNH, TEMP or WIND displayed on the PERF APPR page, received by ACARS uplink, has to be checked. If a modification of these parameters is performed, creating a conflict with previous data, the message retriggers.
CHECK FLT NBR (AOC MSG)	II	The uplinked flight number differs from the flight number specified in the request.
CHECK IRS/AIRPORT POS	II	The distance between ADIRS alignment position and the NAV Database Airport Reference Point is at least 5 NM.
CHECK IRS 1(2)(3)/FM POSITION	II	Each IRS position is compared to the FM position. The difference is greater than a threshold function of time.
CHECK NORTH REF * EFIS ND	II	The MAG/TRUE switch does not correspond to the airport MAG/TRUE bearing reference (as stored in the FMGS navigation database), either at the departure airport (during preflight), or at the destination airport (when entering the ARRIVAL area).
CHECK MIN DEST FOB	II	This message appears when the flight crew has manually entered the MIN DEST FOB value, and MIN DEST FOB is lower than ALTN + FINAL.
CHECK ONSIDE P/N	II	Appears when the FM displays the P/N STATUS page due to an onside incompatibility problem.
CHECK QFE	II	The transition from the QNH to the QFE reference, when the QFE altitude differs by more than 100 ft from the predicted altitude, with the QNH set on the MCDU by means of the airport elevation in the NAV database.

MESSAGE	TYPE/COLOR	CONDITIONS
CHECK TAKEOFF DATA	II	After the flight crew enters or modifies one of the take-off parameters, there may be an inconsistency between the take-off runway, the TO shift or the flaps/THS and V1, V2, VR, FLEX TO temperature or derated level. The flight crew activated the secondary F-PLN in PREFLIGHT or DONE phase.
CHECK WEIGHT	II	The gross weights (GW) computed by the flight management computer (FMC) and the flight augmentation computer (FAC) disagree by more than 7 t (7.7 U.S tons).
CLK IS TAKEOFF TIME	II	The flight crew has entered an estimated takeoff time (ETT) and the actual time is equal to ETT.
CLOCK/GPS TIME DIFF XX	II	The aircraft clock time and GPS time differ by more than XX minutes.
CONSTANT MACH DELETED	II	A constant Mach segment of the active flight plan has been automatically deleted. This occurs when the secondary flight plan or the alternate is activated, an engine-out is detected, or when the flight phase changes from CRZ to another one.
CROSSLOAD ABORTED	II	The message displayed on the transmitting MCDU indicates an error in the transmitting process.
CROSSLOAD COMPLETE	II	The database crossloading from one FMGC to another was successfully completed.
CRZ FL ABOVE MAX FL	II	The flight crew enters a cruise altitude that is above the computed maximum altitude.
CSTR DEL ABOVE CRZ FL	II	A flight plan altitude constraint has been deleted because the flight crew has inserted a cruise flight level or step-down altitude that is at, or below, the flight plan constraint.
CSTR DEL UP TO WPT01	II	Constraints get deleted because the aircraft transitions to a go-around flight phase before the FMGS sequences the flight plan destination.
DECELERATE or T/D REACHED (Also displayed on PFD)	II	The aircraft is still in the cruise phase and managed speed, after it reaches the top of descent, and it has not started the descent.
DEFAULT STATE ASSUMED	II	This appears when all initialization data has been cleared after a very-long-term (VLT) power interruption. The flight crew should see this only when powering up a new MCDU.
XXXX IS DESELECTED	I	The pilot entered a NAVAID, via the RAD NAV or PROG page, that has previously been deselected.
DEST/ALTN MISMATCH	I	The pilot attempts to enter an alternate CO RTE (which starts at an origin that is not the primary flight plan destination).

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
DEST EFOB BELOW MIN	II	The EFOB at destination calculated by the FMS is less than the MIN DEST FOB value specified on the FUEL PRED page, for more than 2 min. The message is triggered in flight, except during Takeoff and Climb phases.
DIR TO IN PROCESS	I	The flight crew calls up the vertical or lateral revision page on one MCDU, while the DIR TO page is displayed on the other MCDU.
ENTER DEST DATA	II	The flight crew has not entered wind, QNH, or temperature for the destination, and the aircraft is 180 NM out.
ENTRY OUT OF RANGE	I	The flight crew attempts to enter data that is outside the range specified for the selected field.
FLT NBR UPLINK (ACARS MSG)	II	A flight number has been added to the uplink flight plan without previous request.
FM DATALINK UNAVAIL (ACARS MSG)	II	No communication is possible between the ATSU and both FMS.
FM PREDICTIONS LOST	II	Due to resets, the predictions of the active F-PLN are unavailable.
FMS1/FMS2 A/C STS DIFF	II	Always precedes a transition to independent mode and appears at power-up, if the system detects a difference in one of the following: - NAV database serial number - Performance database - FM operational program - Aircraft and airline pin programs.
FMS1/FMS2 GW DIFF	II	Onside and offside aircraft weights differ by 2 t or more.
FMS1/FMS2 PGM PIN DIFF	II	Onside and offside pin programs are different.
FMS1/FMS2 POS DIFF	II	Onside and offside positions differ by 5 NM (0.5 NM, if GPS installed) or more.
FMS1/FMS2 SPD TGT DIFF	II	Onside and offside target speeds differ by 5 kt or more.
FORMAT ERROR	I	A data entry does not meet the specified entry format for a given field.
F-PLN DATALINK IN PROG (AOC MSG)	I	A flight plan modification is performed after a F-PLN INIT request has been sent. This message is displayed until the uplink is entirely received.
F-PLN FULL	II	As there is insufficient memory in the flight plan, the computer does not accept anymore flight plan data.
GPS PRIMARY ◁ LOST (also displayed on ND)	II	GPS PRIMARY mode is lost.
GPS PRIMARY ◁	II	The FMS is transitioning to GPS PRIMARY.
GPS ◁ IS DESELECTED	II	GPS has been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
INDEPENDENT OPERATION	II	The FMGCs operate independently of each other.
INITIALIZE WEIGHTS	II	The zero-fuel weight or block fuel (FOB) is undefined after engine start.
INIT DATA UPLINK (AOC MSG)	II	Initialization data has been received from the ground.
INSERT/ERASE TMPY FIRST	I	When performing a DIRECT TO/INTERCEPT revision, if a temporary F-PLN already exists due to a revision other than the DIRECT TO/INTERCEPT revision, no F-PLN waypoint can be inserted from the DIR TO page.
INVALID FLT NBR UPLINK (AOC MSG)	II	The uplink message contains a valid flight plan but no flight number.
INVALID INIT UPLINK (AOC MSG)	II	The initialization uplink message has been rejected.
INVALID ROUTE UPLINK (AOC MSG)	II	As an error is detected in the uplink message, it is rejected.
INVALID TAKEOFF UPLINK (AOC MSG)	II	The current uplink takeoff data message is rejected.
INVALID WIND UPLINK (AOC MSG)	II	The current uplink wind message is rejected.
IRS ONLY NAVIGATION	II	The aircraft is neither in an approach or in a terminal area, and: - The aircraft has been in IRS mode for more than 10 min, or - The aircraft is in IRS mode and is starting the descent phase.
LAT DISCONT AHEAD	II	The next leg is a discontinuity, and the aircraft is 30 s away from flying the leg.
LIST OF 10 IN USE	I	The flight crew has tried to enter more than ten stored runways in the database, and all of the first ten are included in a flight plan, or a pilot-stored route.
LIST OF 20 IN USE	I	The flight crew has tried to create a PBD, LAT/LONG, or PB-PB, or store a pilot-defined waypoint or NAVAID when 20 are already in use (in a flight plan or pilot-stored routes).
MANUAL HOLD DELETED	II	A manually-entered hold has been deleted, due to a change of the arrival procedure.
MCDU OVERHEATED	II	This message is displayed for 15 s in case of MCDU overheating.
MORE DRAG (EFIS PFD)	II	DES mode is engaged, idle is selected and the aircraft must decelerate to recover the path, or to respect an altitude constraint, a speed limit or a speed constraint.
NAV ACCUR DOWNGRAD (also displayed on ND)	II	NAV accuracy downgrades from HIGH to LOW. (See FMGS principles for an explanation).

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
NAV ACCUR UPGRAD (*EFIS ND)	II	NAV accuracy upgrades from LOW to HIGH.
NEW ACC ALT-HHHH	II	The acceleration altitude has changed.
NEW CRZ ALT-HHHHH	II	The cruise altitude has changed.
NEW THR RED ALT-HHHH	II	The thrust reduction altitude has changed.
NO ANSWER TO REQUEST (ACARS MSG)	II	A crew request was previously sent to the ground, and no answer has been received for 4 min.
NO INTERSECTION FOUND	I	The system could not find any common waypoint or intersection point through the airway.
NO NAV INTERCEPT	II	It is triggered, when NAV mode is armed and, no INTERCEPT waypoint exists before the TO waypoint.
NO VERT PATH INTERCEPT	II	The message is displayed when FINAL mode is armed and the aircraft is flying level more than 250 ft above the FMS vertical profile.
NON UNIQUE ROUTE IDENT	I	The flight crew has tried to enter a company route IDENT on the new route page that is identical to an existing company route IDENT (pilot-defined, or in the database).
NOT ALLOWED	I	Data entry is not allowed in the selected field. A selection action is also not allowed.
NOT IN DATA BASE	I	The pilot is trying to enter or call up a company route IDENT, a FROM/TO pair, a place defined by place-bearing-distance (PBD) or place-bearing/ place-bearing (PB/PB) or an airport NAVAID, waypoint runway, or NAVAID frequency (including pilot-defined elements) that is not in the current database.
NOT XMITTED TO ACARS (AOC MSG)	II	A pilot request or crew report was sent, but communication was neither established nor acknowledged.
OFST DELETED IN TMPY	II	The system automatically deletes an offset from the temporary flight plan, if: - The first leg of the temporary F-PLN is no longer a TF, CF or FM - Termination of next leg at destination runway and the current distance to go to the ending offset waypoint is less than the distance required to reach the temporary offset path and return to the temporary parent path.
ONLY SPD ENTRY ALLOWED	I	The pilot is trying to enter a Mach number for a preselected speed value on the CLIMB page.
OPP FMGC IN PROCESS	II	The offside FMGC is unhealthy, and the FM system mode is SINGLE. The message indicates that the MCDU, on which the message is displayed, is being driven by the FMGC on the other side.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
PAGE UPDATE IN PROCESS	I	The flight crew presses a key on the flight plan page while predictions are being updated.
PILOT ELEMENT RETAINED	I	A pilot element is either a waypoint, or a NAVAID, or a route, or a runway that has been stored by the pilot. This message appears when deleting one of these elements is not allowed.
PILOTS ROUTES FULL	I	The system already contains five pilot-defined routes. (only five routes are allowed)
PLACE/WPT MISMATCH	I	When using the Along Track Offset function, the entered PLACE is not identical to the revise point.
PLEASE WAIT	I	Resynchronization between both FMGCs is in progress.
PRINT ABORTED	II	This message informs the crew that the print task has been aborted due to an FMS reset.
PRINTER NOT AVAILABLE (ACARS MSG)	II	A printer communication error was detected while printing a report. The printing was terminated.
PROCEDURE RNP IS XX.XX	II	The RNP value, manually-entered on the PROG page, is larger than the RNP value defined in the navigation database for the active leg or route.
RADIONAV IS DESELECTED	II	Radio NAVAIDs have been manually deselected and the aircraft is 80 NM before the top of descent or in approach phase.
REF/GPS POS DIFF ◁	II	This message is displayed when there is a discrepancy between the reference position entered by the flight crew and the GPS position.
REF/LAST IRS POS DIFF	II	This message is displayed when there is a discrepancy between the reference position entered by the flight crew and the last stored IRS position.
REVISION IN PROCESS	I	One MCDU displays an AIRWAY page and another revision is attempted from the other MCDU.
REVISIONS NOT STORED	II	This message, displayed when a pilot-defined route or company route (active or secondary flight plan) is stored, indicates that the following elements are not retained: - Pilot-entered holds - Offsets - Modifications to terminal area procedures - Pilot-entered constraints - Pseudo waypoints

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
RTA DELETED	II	A time constraint is automatically deleted: - In case of engine-out - When entering the holding pattern - In case of go-around - At phase transition from descent or approach to climb or cruise - When a time constraint is inserted in the same flight plan at a different waypoint - When the alternate flight plan is activated - When a DIR TO/ABEAM is performed, only if the time constrained waypoint is projected as an ABEAM waypoint - The time constrained waypoint is cleared or sequenced (regardless of active lateral mode) - Valid clock data is lost - The time constraint belongs to the active flight plan and the secondary flight plan is activated - The time constraint belongs to the secondary flight plan and COPY ACTIVE is performed
RTA EXISTS	I	Displayed if the pilot tries to clear an estimated takeoff time defined by the system.
RWY/LS MISMATCH	II	- During climb, cruise, descent, approach (ILS/GLS), or go-around, the LS frequency/channel entered on the RAD NAV page does not match the LS associated with the destination runway - During preflight or takeoff, the LS frequency/channel entered on the RAD NAV page does not match the LS associated with the takeoff runway.
SELECT DESIRED SYSTEM	I	The MCDU displays its MENU page.
SELECT HDG/TRK FIRST	I	- When in NAV mode, the temporary flight plan is inserted whilst the first leg of the temporary F-PLN does not match with the active leg. The same applies when in the SEC F-PLN. Then the temporary flight plan insertion is rejected, and the message is triggered.
SELECT TRUE (also displayed on the ND)	II	The MAG/TRUE switch is set to MAG, while the IRS send true HDG/TRK.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
SENSOR IS INVALID	I	- The pilot has selected FF or FQ, or FF + FQ, or FQ + FF on the FUEL PRED page and the sole sensor or both of the selected sensors are invalid, or - The flight crew has entered fuel on board only, and the FF sensor is invalid.
SET GREEN DOT SPEED (SET GREEN DOT displayed on PFD)	II	This message appears when all of the following conditions are met: - Engine-out condition - Aircraft in selected speed mode - FCU-selected speed equal to, or greater than, green-dot speed +10 kt, and ALT* or ALT not active, or FCU-selected speed equal to or less than green-dot speed -10 kt.
SET HOLD SPEED (also displayed on PFD)	II	The aircraft is in selected speed, the pilot has inserted a hold in the flight plan, the aircraft is 30 s or less from the point where it must start decelerating towards hold speed, and the selected speed differs from the hold speed by more than 5 kt.
SET MANAGED SPEED or CHECK SPEED MODE (Also displayed on PFD)	II	The target speed is selected for the current phase, but there is no preselected speed for the next flight phase. When this is so, this message is displayed at transitions from climb to cruise, and from climb or cruise to descent. It is always displayed at the transition to descent from climb or cruise, if selected speed is active. It is not displayed, if managed speed is active.
SETTING SPD/RTA	II	Displayed when the system recomputes its managed speed target to satisfy the RTA constraints.
SPD ERROR AT WPT01	II	In lateral managed flight, the system predicts that the aircraft will miss a speed constraint by more than 10 kt. When the prediction changes, and brings the miss within 5 kt, the message is cleared.
SPD LIM EXCEEDED	II	The aircraft is more that 150 ft below the speed limit altitude, and more than 10 kt over the speed limit.
SPECIF NDB UNAVAIL	II	The NDB to be autotuned (specified for a NDB approach) is unavailable.
SPECIF VOR-D UNAVAIL (also displayed on ND)	II	- The VOR, VOR-DME, or VORTAC to be autotuned (specified for an RNAV or VOR approach) has previously been deselected by the flight crew, or - The bearing, the frequency, or the IDENT of the VOR (or VOR DME or VORTAC) to be autotuned is invalid.
STEP ABOVE MAX FL	II	The pilot has entered a step altitude that is above the predicted maximum altitude.

Continued on the following page

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
STEP AHEAD	II	Indicates that the aircraft is within 20 NM of the active step point.
STEP DELETED	II	A step has been deleted for any reason, including sequencing.
SYSTEM NOT AVAILABLE	I	Displayed when an ATC communication via the ATSU has failed.
TAKEOFF DATA UPLINK (ACARS MSG)	II	A takeoff data message is received.
TO SPEED TOO LOW	II	The flight crew has entered on PERF Takeoff page one or several TO speeds (V1, VR or V2) too low compared with the minimum speeds (VMCG, VMCA or VS1G).
TMPY F-PLN EXISTS	I	The flight crew has selected any key (except ERASE or INSERT), or attempted a flight planning operation on the secondary flight plan while the system is displaying a temporary flight plan.
TIME ERROR AT WPT01	II	While the aircraft is in lateral managed flight, the FMGC predicts that it will miss a time constraint (*Refer to DSC-22_20-30-20-28 Time Constraint/RTA - General*).
TIME MARKER LIST FULL	I	The system already contains four time markers. (Only four are allowed).
TIME TO EXIT	II	The aircraft must leave holding immediately to satisfy fuel reserve requirements. (Extra fuel is zero).
TOO STEEP PATH AHEAD	II	This message is displayed in cruise, if the aircraft is within 150 NM of its destination or in descent or approach phase and in NAV mode and the descent profile contains a segment that is too steep.
TUNE BBB FFF.FF	II	The system cannot autotune the VOR for approach or position, because of a manual VOR selection.
TURN AREA EXCEEDANCE	II	This message is displayed 1.5 min before entry of the PI leg, when in NAV mode, if the PI lateral path exceeds the protection envelope defined in the navigation database.
UNKNOWN PROGRAM PIN	II	The system is unable to initialize, due to an incompatible or undefined aircraft pin program combination (A/C type, engine type, VMO/MMO parity) in the FMGC software.
UPLINK INSERT IN PROG (AOC MSG)	II	An uplink message is currently inserted in the FMGS.
USING COST INDEX NNN	I	This message is displayed when the system contains a flight plan, and the flight crew tries to enter a zero fuel weight or a gross weight into it before defining a Cost Index (CI). (In this case, the FMS defaults to the Cost Index from the last flight). It is also displayed when the flight crew inserts the ALTN F-PLN (in this case, the FMS defaults the cost index to 0).

Continued from the previous page

MESSAGE	TYPE/COLOR	CONDITIONS
V1/VR/V2 DISAGREE	II	This message is displayed when the entered V1, VR and V2 speeds do not satisfy the condition V1 ≤ VR ≤ V2
WAIT FOR SYSTEM RESPONSE	II	During the time between a subsystem selection and the display of the subsystem page, the MCDU MENU page remains displayed with this message.
WIND DATA UPLINK (AOC MSG)	II	Uplink wind message has been received.
WIND UPLINK EXISTS (AOC MSG)	I	A flight plan modification (active or secondary) is attempted when uplink winds are not yet inserted.
WIND UPLINK PENDING (AOC MSG)	II	A temporary flight plan exists, or a DIR TO page is displayed, and a wind uplink is received and stored.

Intentionally left blank

MCDU DATA FORMAT LIST

Ident.: DSC-22_20-50-30-00000920.0085001 / 25 MAY 21

Applicable to: MSN 10949-11597

The following chart lists all the data the flight crew may enter on the MCDU.
It also shows the acceptable format for the various data items, the acceptable range, the units of entry, and the MCDU pages on which the data can be entered.

The following codes are used to indicate various data formats:

A : Letters
N : Numbers
X : Letters and numbers

GENERAL

Ident.: DSC-22_20-60-10-00000921.0001001 / 10 DEC 09
Applicable to: ALL

The baro reference selector of the EIS (Electronic Instrument System) allows the pilot to use the standard barometric reference (STD), sea level atmospheric pressure (QNH), or atmospheric pressure at airfield elevation (QFE option) for the barometer setting.
The selected value is displayed in the baro reference display window of the EFIS control panel and on the Primary Flight Display (PFD) below the altitude scale.
The barometer setting is used as a reference for the altimeter of the PFD and for the PFD target altitude. In flight, it affects the predicted altitudes on the MCDU and the descent path computation.

MCDU ALTITUDE PREDICTIONS

Ident.: DSC-22_20-60-10-A-00000922.0001001 / 10 DEC 09
Applicable to: ALL

GENERAL

The FMGS predicts at each waypoint of the flight plan an altitude that is a function of all data in the lateral and vertical flight plans.

Ident.: DSC-22_20-60-10-A-00000927.0001001 / 10 DEC 09
Applicable to: ALL

ON THE GROUND

The altitude predicted at each waypoint is displayed as altitude in feet above mean sea level (AMSL) when it is below the transition altitude and as flight level when it is above the transition altitude. The altitude constraints are also displayed, and they follow the same rule (feet or flight level).
The predicted altitude is equal to the airport elevation plus the height you must attain in order to reach the waypoint in the applicable mode (climb or descent).

F-PLN A page

Ident.: DSC-22_20-60-10-A-00000924.0001001 / 16 FEB 11

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

IN FLIGHT

The predicted altitude is equal to the aircraft altitude (as a function of the barometer setting), plus or minus the height you must attain to reach the waypoint in the applicable mode (climb or descent).

- In climb:
  Altitude predictions and constraints are displayed as altitude in feet above mean sea level (AMSL) at, or below, the transition altitude, and as the flight level above it.
  For example : If the transition altitude is 5 000 ft and you insert an altitude constraint as 8 000 ft, the MCDU F-PLN A page displays it as FL 80
- In descent:
  If “STD” is selected on the EIS control panel, altitude predictions and constraints above the transition level are displayed as flight levels, and those below the transition level are displayed as altitude AMSL.
  If sea level standard pressure (QNH), or field elevation pressure (QFE option), is selected on the EIS control panel, altitude predictions and constraints are displayed as altitudes AMSL, regardless of the transition altitude.
  For example: If the transition level is FL 50 and you insert an altitude constraint of 8 000 ft into the MCDU, the MCDU F-PLNS A page will display it as FL 80, if “STD” is selected, and as 8 000 ft, if “QNH” (or “QFE” option) F-PLN A page is selected.

Ident.: DSC-22_20-60-10-A-00000924.0002001 / 16 FEB 11

  If sea level standard pressure (QNH), or field elevation pressure (QFE option), is selected on the EIS control panel, altitude predictions and constraints are displayed as altitudes AMSL, regardless of the transition altitude.
  For example: If the transition level is FL 50 and you insert an altitude constraint of 8 000 ft into the MCDU, the MCDU F-PLN A page will display it as FL 80, if “STD” is selected. If “QNH” (or “QFE” option) is selected, the MCDU F-PLN A page will display the barometric corrected altitude constraint.

TARGET ALTITUDE ON PFD

Ident.: DSC-22_20-60-10-00000925.0001001 / 01 OCT 12
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The PFD target altitude may either be:

- The altitude selected on the FCU, or
- A flight management altitude constraint, if the climb mode or descent mode is engaged and the system predicts a level-off at a constraint that comes before reaching the FCU altitude.

The PFD target altitude depends on the barometer setting:

- If “STD” is selected, the target is a flight level
- If “QNH” or “QFE” is selected, the target is an altitude or height.

The aircraft will level off accordingly.

Note:
- *If the pilot changes the barometer setting during ALT* or ALT CST*, the aircraft may overshoot the target altitude, because the current value has been changed. However, the ALT* and ALT CST* modes allow the aircraft to regain the FCU altitude. As a general rule, avoid changing the barometer setting when in ALT* or ALT CST**
- *In aircraft equipped to use field elevation pressure (QFE option), switching from STD to QFE (or vice versa) in ALT CST* green changes the target value and may revert the vertical mode into V/S mode.*

NOTE FOR AIRCRAFT WITH QFE (FIELD ELEVATION PRESSURE) PIN PROGRAM

If you select “QFE” on the EFIS control panel:
- The MCDU predictions follow the basic rules (altitudes are AMSL below the transition level, flight levels above it)
- The altitude constraints on the MCDU follow the basic rules
- The target altitude on the PFD is QFE related:
  - If the target altitude has been selected by the FCU, the aircraft will level off there.
  - If the target altitude is an altitude constraint, the PFD automatically shows that constraint as corrected by the airport elevation.

PROCEDURES

Ident.: DSC-22_20-60-10-00000928.0001001 / 17 MAY 21
Applicable to: ALL

a. The altitude constraints in departure and arrival procedures should be defined in the navigation database or by the pilot on the MCDU:
   - in terms of altitude AMSL below the transition altitude
   - in terms of flight level above the transition altitude

   If a departure procedure defines an altitude constraint as an AMSL altitude above the transition altitude, you must convert it to STD, because the system and guidance will treat it as a flight level whenever you select the standard barometer setting.

b. In climb you should switch from QNH (or QFE) to STD on both EFIS control panels simultaneously when you reach the transition altitude.
   All MCDU altitude predictions and altitude constraints and all PFD altitude targets will be displayed as flight levels.

c. In descent, when ATC clears you to an altitude below the transition altitude, you can select QNH (or QFE) on both EFIS control panels simultaneously.
   All MCDU altitude predictions and constraints and PFD targets are now altitude AMSL.

Intentionally left blank

CLEARING THE SCRATCHPAD OF DATA OR MESSAGES

Ident.: DSC-22_20-60-20-00000929.0001001 / 16 FEB 11
Applicable to: ALL

Press the “CLR” key with a single brief touch to erase the last alphanumeric character inserted in the scratchpad.
Press the key for more than three seconds to erase all the data inserted in the scratchpad. If the scratchpad is empty, it displays “CLR”.

CLEARING DATA FIELDS

Ident.: DSC-22_20-60-20-00000930.0001001 / 16 FEB 11
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

Clear a data field by pressing the “CLR” key, the scratchpad displays CLR, then select the prompt for the field you want to clear (3L for example).

- You cannot clear all data fields:
  - If the field contains data that has a default value or a value computed by the FMGC, the data reverts to this value.
  - Any attempt to clear the defaulted value has no effect.
- Clearing a constraint on the F-PLN page deletes both the speed constraint and the altitude constraint associated with the waypoint
- If you clear a data field that is a waypoint in the flight plan (primary or secondary), you delete this waypoint from the flight plan and create a discontinuity. The discontinuity can also be cleared in a similar way.

GENERAL

Ident.: DSC-22_20-60-30-00000932.0002001 / 16 FEB 11
Applicable to: ALL

Various features are provided to the crew in order to execute a diversion:
- The EQUITIME POINT
- The CLOSEST AIRPORTS pages
- The SECONDARY F-PLN
- The ENABLE ALTN function
- The NEW DEST revision

DIVERSION TO PREPLANNED ALTERNATE AIRPORT

Ident.: DSC-22_20-60-30-00000933.0003001 / 16 FEB 11
Applicable to: MSN 04827-04860

This would probably occur at the end of the cruise phase, during descent or go-around. The pilot can use this method for diverting if the primary flight plan includes an alternate flight plan from destination to a suitable alternate airport.

When decided to divert to the alternate airport from a given waypoint, simply execute an “ENABLE ALTN” (enable alternate) revision:

SELECT “LAT REV” at a given waypoint
PRESS the “ENABLE ALTN” key
CHECK the temporary flight plan (TMPY F-PLN) and INSERT.
USE the DIR TO function to go to the required waypoint.

Note: *In most cases, the LAT REV shall be selected at the TO waypoint. This will facilitate the subsequent selection of the DIR TO waypoint.*

CLOSEST AIRPORTS
PAGE 2

SELECT the EFOB/WIND prompt, to access the CLOSEST AIRPORTS Page 2.
CHECK/INSERT the effective wind at the selected airports.
CHECK the predictions and CHOOSE the adequate diversion airport.
PREPARE the diversion flight plan on the SEC F-PLN.

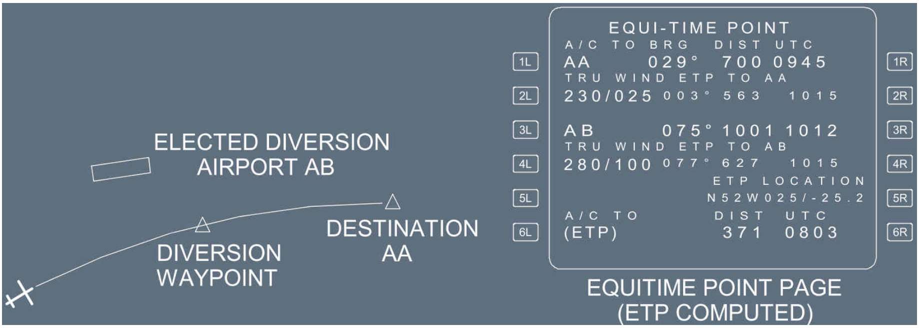
Note: *Fuel/time predictions on the CLOSEST AIRPORTS page assume managed speed is used.*

EN ROUTE DIVERSION OVER OCEANIC OR DESERTIC AREA

Ident.: DSC-22_20-60-30-00009528.0001001 / 16 FEB 11
Applicable to: ALL

The diversion airports are usually determined before departure or using the CLOSEST AIRPORTS data.

SELECT the EQUI-TIME POINT page.



```
      EQUI-TIME POINT
A/C  TO  BRG    DIST  UTC
AA       029°   700  0945
TRU  WIND  ETP  TO  AA
230/025  003°  563    1015

AB        075°  1001  1012
TRU  WIND  ETP  TO  AB
280/100  077°  627    1015
               ETP LOCATION
              N52W025/-25.2
A/C  TO          DIST   UTC
(ETP)             371   0803
```

ENTER the airport idents in 1L and 3L fields.
ENTER the associated winds in 2L and 4L fields.
CHECK the ETP position and time.
ENTER a predicted time at ETP as time marker.
PREPARE a diversion flight plan on the secondary flight plan.

DIVERSION PREPARATION ON THE SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-30-00009530.0002001 / 16 FEB 11

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The following procedure shall be applied for all diversion cases, once the diversion airport has been selected, as well as the “most probable diversion point of the F-PLN”:

PRESS the SEC F-PLN key
PRESS the COPY ACTIVE prompt
SELECT a lateral revision at diversion waypoint
ENTER the ident of the diversion airport in the NEW DEST field.

Then finalize the flight plan between the diversion point and the diversion airport. When the diversion airport is no longer applicable or ETP is sequenced, repeat the same procedure for the next diversion airport.

MISCELLANEOUS

Ident.: DSC-22_20-60-30-00009531.0002001 / 16 FEB 11

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

In some cases, the diversion airport may be simply chosen using the airports displayed on ND when AIRPORT is selected on the EIS control panel.

During oceanic or desertic area flights, the flight crew may use the PROG page, as follows:

ENTER the ident of the diversion airport in the 4R field of MCDU 1
ENTER the next diversion airport in the 4R field of MCDU 2

Then, the FMS continuously calculated the BRG/DIST to the selected diversion airports.

UPDATE the PROG pages when sequencing the ETP.

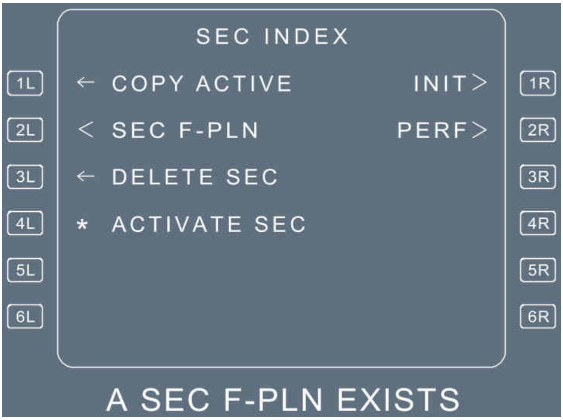
EXECUTION OF THE DIVERSION

Ident.: DSC-22_20-60-30-00009532.0001001 / 16 FEB 11

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

When the crew decides to divert:

PRESS the SEC F-PLN key.
SELECT the ACTIVATE SEC prompt.
SELECT DIR TO required point.



A SEC F-PLN EXISTS

DIVERSION TO THE ALTERNATE AIRPORT

Ident.: DSC-22_20-60-30-00009537.0001001 / 16 FEB 11

5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The primary F-PLN includes an alternate flight plan from destination to the preferred alternate airport.
All fuel prediction and management (EXTRA fuel) take the alternate flight plan into consideration.
If the crew decides to divert at the end of the cruise, or beyond the last ETP, or in the descent or go-around phases, this will most probably be to the alternate airport.

When the crew decides to divert:

SELECT a lateral revision at suitable waypoint
SELECT ENABLE ALTN prompt
CHECK the temporary flight plan and INSERT
SELECT DIR TO required waypoint

Note:
- *In most cases, the LAT REV shall be selected at the TO WPT. This will facilitate the subsequent selection of the DIR TO waypoint.*
- *The ALTN flight plan shall be finalized, whenever the landing runway is known by the crew (before approach briefing).*
  In most cases, this will ensure that the most probable flight plan is displayed on the MCDU once ENABLE ALTN is selected.

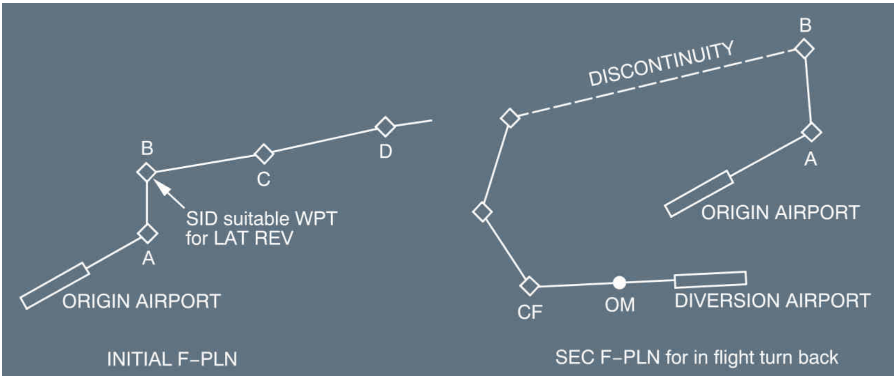
USING THE SECONDARY FLIGHT PLAN FUNCTION

Ident.: DSC-22_20-60-30-00000935.0002001 / 19 DEC 12
Applicable to: MSN 04827-04860

Use the SEC F-PLN function if a secondary flight plan for diversion has been prepared:

WHILE THE AIRCRAFT IS ON THE GROUND,

you have prepared the lateral path you would expect to use in case of an early in flight turn back (major failure after takeoff or during initial climbout), or the lateral path you would expect to use to land at a nearby diversion airport (weather at origin airport requires a takeoff alternate).

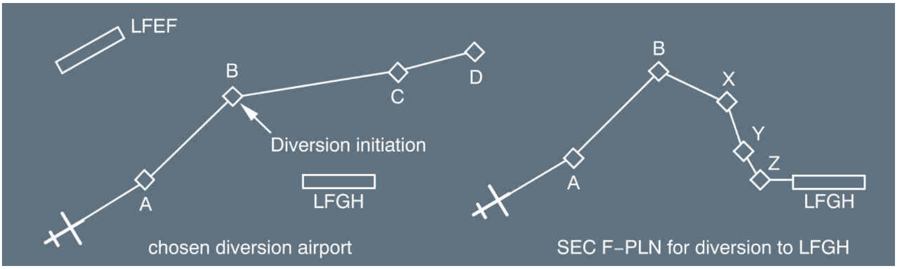


B
C
D
SID suitable WPT for LAT REV
A
ORIGIN AIRPORT
INITIAL F–PLN
DISCONTINUITY
B
A
ORIGIN AIRPORT
CF
OM
DIVERSION AIRPORT
SEC F–PLN for in flight turn back

SELECT the “SEC F-PLN” key on the MCDU.
DEPRESS the “COPY ACTIVE” key.
SELECT “LAT REV” at a waypoint with a suitable SID.
ENTER the ident of the diversion airport as the new destination.
ENTER the expected approach and route.
DEPRESS the PERF prompt on SEC INDEX page.
SELECT the PERF APP page of the secondary F-PLN.
ENTER the QNH and wind.
SELECT the landing configuration.

TO PREPARE A DIVERSION, IN CRUISE PHASE

The flight crew should consider the adequate diversion airports as the aircraft proceeds along the route of the active flight plan. For this purpose, the CLOSEST AIRPORTS page, EQUI-TIME POINT function, or EFIS “Airports” feature on the ND may be used.
Once selected, the flight crew should enter the diversion airport as the destination of the secondary flight plan, and adjust the routing as required.



SELECT the “SEC F-PLN” function key on MCDU.
PRESS the “COPY ACTIVE” prompt.
USE the CLOSEST AIRPORTS page, the EQUI-TIME POINT function, or the “AIRPORT” display on the ND.

Choose an adequate diversion airport and diversion initial waypoint.

SELECT “LAT REV” at the chosen waypoint.
ENTER the new destination (NEW DEST field).
MODIFY/COMPLETE the lateral flight plan.

To initiate the prepared diversion:
The flight crew may initiate the diversion prepared in the SEC F-PLN, as follows:

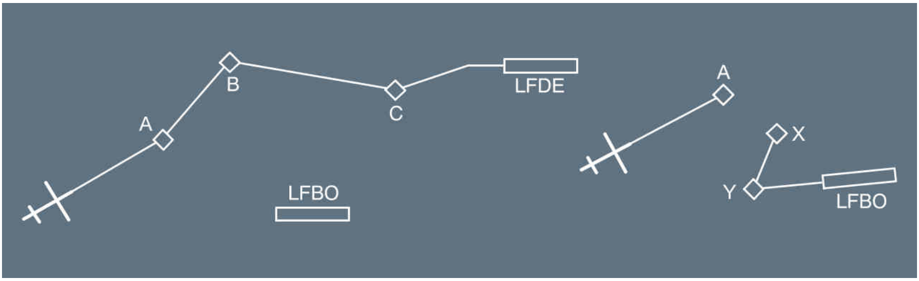
SELECT the “SEC F-PLN” key on the MCDU.
PRESS the “ACTIVE SEC” prompt [4L].

PERFORM a DIR TO to the desired waypoint in the new active flight plan.

USING NEW DESTINATION FUNCTION

Ident.: DSC-22_20-60-30-00000936.0004001 / 01 OCT 12
Applicable to: MSN 04827-04860

If the crew has not prepared a diversion in the SEC F-PLN, the “NEW DEST” function allows to make the required change on the active flight plan.
Because the crew will probably have to initiate the diversion quickly, the revision waypoint will probably be the “TO” waypoint.
The crew will have to adjust the resulting active flight plan in order to have the correct routing to destination and have the applicable performance data entered.



SELECT “LAT REV” at the “TO” waypoint.
ENTER the ident for the new destination in the NEW DEST field (4R).
In the TMPY F-PLN, COMPLETE the lateral flight plan to the diversion airport.
CHECK the TMPY F-PLN, and INSERT.
ENTER/CHECK performance data as applicable.
When the diversion is initiated, USE a “DIR TO” to the appropriate waypoint.

Note: *The temporary flight plan is displayed if the new destination airport is either in the Navigation Database, or in the pilot-defined runway file. Otherwise, the NEW RUNWAY page will appear so that the pilot can store a new runway.*

Intentionally left blank

GENERAL

Ident.: DSC-22_20-60-40-00000937.0001001 / 16 FEB 11
Applicable to: ALL

When the FMGS detects an engine-out condition, the following occurs:

FLIGHT MANAGEMENT PART

Ident.: DSC-22_20-60-40-00000938.0030001 / 16 MAR 11
Applicable to: MSN 04827-04860

- The managed target speeds is immediately set to a value that depends upon the flight phase
- The following pilot entries are deleted: preselected speeds, steps, time constraints
- No predictions are available for the ALTN flight plan, and the associated fields are dashed
- Predictions on the secondary flight plan are lost, if it is a copy of the active flight plan
- The PROG page shows the engine-out maximum recommended (EO MAX REC) altitude
- The system automatically calls up the current performance page, which has the EO CLR (engine-out clear) prompt displayed in the 1R field (except during takeoff, before the diversion point is reached).
  If the crew presses the EO CLR, the 2 engine predictions and performance will be restored. Reverting back to one engine-out performance is not possible, unless the system detects a new EO condition. Therefore, the pilot should not press the EO CLR key, if an actual engine-out is detected

FLIGHT MANAGEMENT PART

Ident.: DSC-22_20-60-40-00000938.0026001 / 16 MAR 11
1 **Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-03002, 03035-03284, 03313-03565, 03630-03662, 03761-03816, 04352-04358, 04441-04544, 04570-04662, 04953-04974, 05066, 05101-05342, 05528-05987, 06097, 06121, 06139-06876, 06949-09324, 10949-11597**

- The managed target speeds is immediately set to a value that depends upon the flight phase
- All preselected speeds entered in the MCDU are deleted
- Step climb (or step descent), if entered, is deleted
- The time constraint is deleted
- The PROG page shows the engine-out maximum recommended (EO MAX REC) altitude
- The system automatically calls up the current performance page, which has the EO CLR (engine-out clear) prompt displayed in the 1R field (except during takeoff, before the diversion point is reached).
  If the crew presses the EO CLR, the 2 engine predictions and performance will be restored. Reverting back to one engine-out performance is not possible, unless the system detects a new EO condition. Therefore, the pilot should not press the EO CLR key, if an actual engine-out is detected

FLIGHT MANAGEMENT PART

- The managed target speeds is immediately set to a value that depends upon the flight phase
- All preselected speeds entered in the MCDU are deleted
- Step climb (or step descent), if entered, is deleted
- The time constraint is deleted
- The PROG page shows the engine-out maximum recommended (EO MAX REC) altitude
- The system automatically calls up the current performance page, which has the EO CLR (engine-out clear) prompt displayed in the 1R field (except during takeoff, before the diversion point is reached).
  If the crew presses the EO CLR, the 2 engine predictions and performance will be restored. Reverting back to one engine-out performance is not possible, unless the system detects a new EO condition. Therefore, the pilot should not press the EO CLR key, if an actual engine-out is detected
- It is not permitted to use the autopilot to perform non precision approaches in engine-out in the following modes: FINAL APP, NAV V/S, NAV/FPA. Only FD use is authorized.

FLIGHT GUIDANCE PART

Ident.: DSC-22_20-60-40-00000939.0002001 / 04 JUL 17
Applicable to: ALL

- All selected modes remain available (the “HDG/TRK”, “V/S”, and “OPEN” modes, for example)
- In the speed reference system (SRS) mode, the takeoff speed target is V2, or the current speed if it is higher but no more than V2 +15. The magenta triangle indicates V2 in all cases. The GO Around speed target is VAPP, or the current speed if higher, limited to VLS +15 kt
- The system limits autopilot (AP) and flight director (FD) bank angles during takeoff and approach phases as follows:
  - 15 ° when the aircraft speed is below the maneuvering speeds (F, S, or Green Dot speed) -10 kt , and then
  - In selected lateral guidance:
    - Linear increase to 25 ° up to maneuvering speeds (F, S, or Green Dot speed) -3 kt
    - 25 ° above maneuvering speeds (F, S, or Green Dot speed) -3 kt .
  - In managed lateral guidance:
    - Linear increase to 30 ° up to maneuvering speeds (F, S, or Green Dot speed) -3 kt
    - 30 ° above maneuvering speeds (F, S, or Green Dot speed) -3 kt .

Note: *The engine-out bank angle limits apply, when the FG part of the FMGS has detected an engine-out. It cannot be cleared by the crew through the MCDU EO CLEAR prompt.*

AUTOTHRUST

Ident.: DSC-22_20-60-40-00000940.0001001 / 16 FEB 11
Applicable to: ALL

The system extends the active range of the active engine from idle to maximum continuous thrust (MCT instead of CL thrust).
The Flight Mode Annunciator requests maximum continuous thrust on the live engine at a time that depends on when the engine-out occurs.

ENGINE-OUT CONDITIONS

Ident.: DSC-22_20-60-40-00000941.0001001 / 16 FEB 11
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The FMGS considers the aircraft to be in an engine-out condition, when one of the following conditions is present and the aircraft has commenced takeoff or is in flight:

- One engine master switch off, or
- N2 below idle, or

- One thrust lever angle is below 5 ° with the other above 22 °, or
- The FADEC shows an engine fault.

ENGINE-OUT CONDITIONS

Ident.: DSC-22_20-60-40-00000941.0002001 / 02 MAY 23
Applicable to: MSN 04827-04860

3

The FMGS considers the aircraft to be in an engine-out condition, during takeoff or in flight phase when one of the following conditions is applicable:

- One engine master lever is off for CFM engines, one engine is shut down for IAE or PW engines, or
- N2 below idle, or
- One thrust lever angle is below 5 ° with the other above 22 °, or
- The FADEC shows an engine fault.

ENGINE-OUT SID

Ident.: DSC-22_20-60-40-A-00000942.0001001 / 14 MAY 12
4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

GENERAL

An engine-out standard instrument departure (EOSID), when defined in the database, is always for a specific runway. It is indicated on the bottom line of the SID page for that runway, and you can select it manually.
The pilot can review the SID either by selecting the PLAN mode on the navigation display (solid yellow line), or by selecting it on the SID page. In the latter case, the navigation display shows the SID as a temporary flight plan.
The last point, if any, that is common to both the SID and engine-out SID is called the diversion point (DP).

WHEN AN ENGINE-OUT CONDITION OCCURS BEFORE THE DIVERSION POINT

The MCDU automatically shows the engine-out SID as a temporary flight plan on the F-PLN page and on the ND. The EOSID can be inserted or erased.

Note: *The EOSID Diversion Point is the waypoint at which the EOSID diverges from the active SID.*
If there is no common leg between the SID and the EOSID in the navigation database, the diversion point is by default the runway threshold. Therefore the SID and EOSID common leg(s) before the flight paths separation must be the same type and nature.

EOSID YELLOW LINE

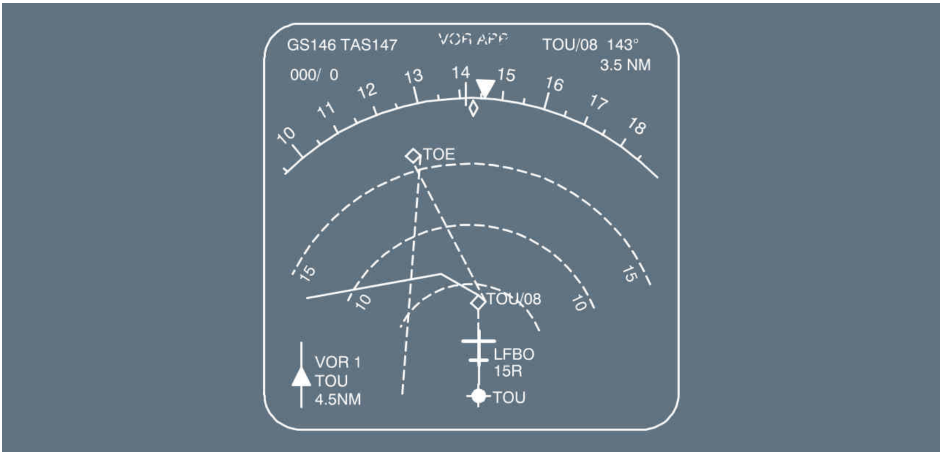
Ident.: DSC-22_20-60-40-A-00000945.0002001 / 14 MAY 12

Applicable to: ALL

BELOW THRUST-REDUCTION (THR RED) ALTITUDE

- The managed target speed changes to V2
- The PROG page displays the engine-out maximum recommended altitude

- The PERF TO page comes up on the display automatically with the “EO CLR” prompt in the 1R field
- The MCDU and the navigation display show the engine-out SID as a temporary flight plan, or the navigation display shows it for information only, depending upon the diversion point location.



PROCEDURE

- **When the aircraft reaches the engine-out acceleration altitude**

  PUSH in the V/S knob to level off.

  CLEAN up your configuration as the speed increases toward target speed.

  When the aircraft is clean and has reached Green Dot speed, “LVR MCT” flashes on the FMA,

  PULL out the altitude selector knob to resume the climb.

  The OP CLB. mode engages.

  MOVE the thrust lever for the live engine to “MCT” detent.

Ident.: DSC-22_20-60-40-A-00000946.0006001 / 16 FEB 11
Applicable to: ALL

ABOVE THRUST REDUCTION (THR RED) ALTITUDE

- The managed target speed changes to V2
- “LVR MCT” flashes amber on the flight mode annunciator
- The PROG page displays the engine-out maximum recommended altitude
- The PERF TO page displays the “EO CLR*” prompt in the 1R field
- The navigation display shows the EO SID.

PROCEDURE

MOVE the thrust lever of the active engine to the MCT detent.

- **When the aircraft reaches the engine-out acceleration altitude:**
  PUSH the V/S knob, in order to level off.
  CLEAN UP configuration as the speed increases.
- **When the aircraft reaches Green Dot speed:**
  PULL the ALT knob to resume the climb.

  Note: *If necessary, move the thrust lever of the active engine to the TOGA detent. The Flight Mode Annunciator will display "LVR MCT", flashing in white, when the aircraft reaches Green Dot speed.*

ENGINE-OUT IN CLB PHASE (ABOVE ACCELERATION ALTITUDE)

Ident.: DSC-22_20-60-40-B-00000947.0003001 / 16 FEB 11
Applicable to: ALL

ENGINE-OUT OCCURS WHILE AIRCRAFT IS ACTUALLY CLIMBING

- The managed target speed changes to Green Dot speed
- "LVR MCT" flashes white on the Flight Mode Annunciator
- The climb mode reverts to open climb (OP CLB) and the aircraft slowly decelerates down to Green Dot speed
- The MCDU shows the PERF CLB page with an "EO CLR*" (clear engine-out) prompt
- The PROG page shows the engine-out maximum recommended altitude (EO MAX REC ALT).

PROCEDURE

MOVE the thrust lever of the active engine to the MCT detent.
SET the altitude on the Flight Control Unit to an altitude below the engine-out maximum recovery altitude, as cleared by ATC.
INITIATE a diversion, when cleared to do so.

Ident.: DSC-22_20-60-40-B-00000948.0001001 / 16 FEB 11
6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

ENGINE-OUT OCCURS WHILE THE AIRCRAFT IS FLYING IN ALT MODE AT AN ALTITUDE SET ON THE FLIGHT CONTROL UNIT

- The target speed is set to engine-out cruise speed (EO CRZ SPD), computed at the altitude set on the Flight Control Unit, but limited by the limit speed (SPD LIM), if there is one.

Other consequences and procedures are similar to previous engine out climb.

ENGINE-OUT IN CRUISE PHASE

Ident.: DSC-22_20-60-40-00000949.0001001 / 17 NOV 20

7 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

- The system sets the managed target speed to the higher of engine-out cruise Mach number or speed, or current speed.
- “LVR MCT” (or MCT) flashes on the Flight Mode Annunciator.
- The PERF CRZ page appears with the “EO CLR*” (clear engine-out) prompt.
- The PROG page displays the engine-out maximum recommended altitude (EO MAX REC ALT).

PROCEDURE

Perform engine out abnormal procedure.
Refer to EFB-IFT-30 One Engine Inoperative Strategies.
Initiate a diversion if necessary.

Note: *The engine-out descent strategy requires disconnection of the autothrust, and descent in OPEN DES mode.*
Disconnecting the autothrust prevents an automatic setting of THR IDLE; therefore, the autopilot will fly the target speed in OP DES mode, with a thrust manually selected by the crew.
When reaching the FCU-selected altitude, or whenever normal descent is resumed to a lower altitude, reengage the autothrust.

ENGINE-OUT IN CRUISE PHASE

Ident.: DSC-22_20-60-40-00000949.0002001 / 17 NOV 20

Applicable to: MSN 04827-04860

- The system sets the managed target speed to the higher of engine-out cruise Mach number or speed, or current speed.
- “LVR MCT” (or MCT) flashes on the Flight Mode Annunciator.
- The PERF CRZ page appears with the “EO CLR*” (clear engine-out) prompt.
- The PROG page displays the engine-out maximum recommended altitude (EO MAX REC ALT).

PROCEDURE

Perform engine out abnormal procedure.
Refer to EFB-IFT-30 One Engine Inoperative Strategies.
Initiate a diversion if necessary.

Note: *The engine-out descent strategy requires disconnection of the autothrust, and descent in OPEN DES mode.*
Disconnecting the autothrust prevents an automatic setting of THR IDLE; therefore, the autopilot will fly the target speed in OP DES mode, with a thrust manually selected by the crew.
When reaching the FCU-selected altitude, or whenever normal descent is resumed to a lower altitude, reengage the autothrust.

CHECK the MIN DEST FOB value on the FUEL PRED page.

If necessary, update the ALTN fuel value, according to the chosen flight strategy.

ENGINE-OUT IN DESCENT PHASE

Ident.: DSC-22_20-60-40-00000951.0001001 / 16 FEB 11
8 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

- The managed target speed remains unchanged (ECON DES Mach number or speed, with any speed limitations).
- “LVR MCT” (or MCT) flashes on the Flight Mode Annunciator.
- The PERF DES page appears, showing the “EO CLR*” prompt.
- The PROG page displays the engine-out maximum recommended altitude (EO MAX REC ALT).
- The descent mode (if engaged) reverts to V/S, if the aircraft is above the EO REC MAX. If not, the descent mode is maintained.

PROCEDURE

MOVE the thrust lever for the live engine to the MCT detent.
If necessary, SELECT a suitable flight mode for descent.
DISCONNECT the autothrust and ADJUST thrust if necessary.

ENGINE-OUT IN DESCENT PHASE

Ident.: DSC-22_20-60-40-00000951.0004001 / 16 FEB 11
Applicable to: MSN 04827-04860

- The managed target speed remains unchanged (ECON DES Mach number or speed, with any speed limitations).
- “LVR MCT” (or MCT) flashes on the Flight Mode Annunciator.
- The PERF DES page appears, showing the “EO CLR*” prompt.
- The PROG page displays the engine-out maximum recommended altitude (EO MAX REC ALT).

PROCEDURE

MOVE the thrust lever for the live engine to the MCT detent.
If necessary, SELECT a suitable flight mode for descent.
DISCONNECT the autothrust and ADJUST thrust if necessary.

ENGINE-OUT IN APPROACH PHASE

Ident.: DSC-22_20-60-40-00000952.0001001 / 04 JUL 17
Applicable to: ALL

- The aircraft maintains approach speed (VAPP).
- “LVR MCT”(or MCT) flashes on the Flight Mode Annunciator.
- The PERF APPR page appears, showing the “EO CLR*” prompt.
- The progress page displays the engine-out maximum recommended altitude (EO MAX REC ALT).

PROCEDURE

MOVE the thrust lever for the live engine to the MCT detent.

CAUTION	Below maneuvering speed (F, S, Green Dot) – 10 kt, the autopilot or flight director (AP/FD) cannot order a bank angle greater than 15 °. Above maneuvering speed – 10 kt, this limit linearly increases until it reaches: - In selected lateral guidance: 25 ° at maneuvering speed – 3 kt. The limit is then 25 ° for all speeds above maneuvering speed – 3 kt. - In managed lateral guidance: 30 ° at maneuvering speed – 3 kt. The limit is then 30 ° for all speeds above maneuvering speed – 3 kt.

ENGINE-OUT IN GO-AROUND PHASE

Ident.: DSC-22_20-60-40-00000953.0002001 / 16 FEB 11
Applicable to: ALL

The results and procedures for takeoff phase apply, except that the displays do not show the engine-out SID.

SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-50-00000954.0004001 / 14 MAY 12
Applicable to: MSN 04827-04860

The secondary flight plan (SEC F-PLN) is an alternative flight plan which can be activated when required.
It may include all the vertical elements except history wind data.

The flight crew can:
- Create a secondary flight plan independently from the active flight plan (a secondary flight plan can be created while a temporary flight plan exists).
- Copy it from the active flight plan.
- Delete it completely.
- Activate it, when the “ACTIVATE SEC” prompt is displayed: The secondary flight plan becomes the active flight plan.

- The screen displays the “ACTIVATE SEC” prompt in flight if:
  - HDG (or TRK) mode is engaged, or
  - NAV mode is engaged, and the active leg of the primary and secondary flight plans is the same.
- The screen displays the “INIT” prompt in all cases.
  The FMS sequences the secondary flight plan the same way as the active flight plan, when it is a copy of the active flight plan.

The navigation display shows the secondary flight plan in white. In PLAN mode, the crew can use the slew keys to review the secondary flight plan (as for the primary flight plan).

PREDICTIONS

The FMGS computes predictions using the same performance methods and performance factor it uses for the active flight plan. However, it predicts pseudo waypoints only for the MCDU not for the Navigation Display (ND).
The FMGS does not provide any prediction in the secondary flight plan for the DESCENT, APPROACH and GO AROUND phases.

- **When the flight crew initializes the secondary flight plan with the SEC INIT function:**
  The FMGS computes the secondary flight plan predictions as if the aircraft were on ground before engine start. The FMGS computes these predictions one time and does not update them to indicate the progress of the flight (aircraft position, fuel consumption, etc.).
- **When the flight crew initializes the secondary flight plan with the COPY ACTIVE function:**
  - The FMGS computes the secondary flight plan predictions as for the active flight plan. However:
    - The FMGS stops the update of the predictions if the first leg of the active flight plan is no longer the same as the active leg (i.e. if both flight plans diverge). The flight phase is the same as the flight phase at the time of the divergence.

      Note: *This does not apply to the preflight phase, when the FMGS computes the predictions if the departure airports are the same, even if the takeoff runways are different.*
    - The FMGS stops the update and the display of the predictions when the aircraft reaches the Top of Descent of the primary flight plan, or the Top of Descent of the secondary flight plan, whichever the aircraft reaches first.
  - In the SEC F-PLN, the computed distance between the "TO" waypoint, and the following waypoints may be erroneous when:
    - ■ The SEC F-PLN is created using the COPY ACTIVE function
    - ■ Lateral modifications are performed in either the active, or the SEC F-PLN
    - ■ The "TO" waypoint and/or the following waypoints differ between the ACTIVE, and the SEC F-PLN.

    Note: *1. As a result, in the SEC F-PLN, fuel and time predictions are also erroneous because they are computed using the erroneous distance.*
    2. If the SEC F-PLN is activated, the resulting ACTIVE F-PLN is not affected: distances and fuel/time computations in the active F-PLN are correct.

- **The flight crew may use the secondary flight plan in the following cases:**
  - At takeoff when an alternate takeoff runway is probable
  - On ground to initialize the FMGS again if the flight that the flight crew initially prepared is replaced by another flight (*Refer to PRO-NOR-SRP-01-05 Introduction*)
  - In flight to prepare a diversion
  - In flight when an alternate landing runway is probable
  - To prepare the next flight.

SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-60-50-00000954.0011001 / 14 MAY 12

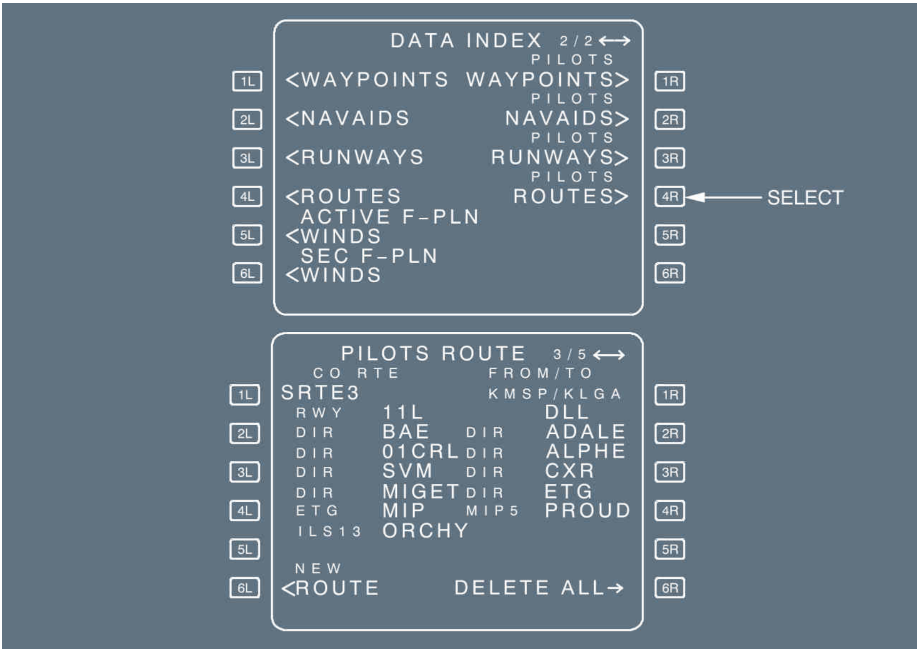
PILOTS ROUTE FUNCTION

Ident.: DSC-22_20-60-60-00000955.0003001 / 01 OCT 12
Applicable to: MSN 04827-04860

The pilot's route function allows the pilot to store or review as many as five different routes defined in an active or secondary flight plan.

This also allows the pilot to store a company route that is not yet in the database, but is expected to be flown several times (a charter route, for example).

Access the PILOTS ROUTES page from the DATA INDEX page.



```
          DATA INDEX   2/2←→

HOW TO STORE THE SECONDARY FLIGHT PLAN

SELECT the DATA key on MCDU
PRESS the “PILOTS ROUTES” key
PRESS the “NEW ROUTE” key
ENTER the company route name (optional)
PRESS the “STORE SECONDARY F-PLN” key

Note: *1. In either case, you may only store a company route if the active or secondary flight plan is complete from origin to destination.*
2. If you do not enter a name, the FMGS automatically names the stored route as “SRTE 1 (or 2, ...)” when it is stored.
3. The system does not retain several elements of the flight plans, when they are stored:
- *Pilot-entered holds*
- *Offsets*
- *Pilot-entered constraints*
- *Modifications to a terminal procedure*
- *Pseudo waypoints*

When this happens, it displays “REVISIONS NOT STORED”.
4. If five routes are already stored the system will reject a new entry and display “PILOTS ROUTES FULL” on the MCDU. Delete one stored route by clearing the CO RTE name before inserting a new one.

STORED ROUTE FUNCTION

Ident.: DSC-22_20-60-60-00000955.0002001 / 01 OCT 12

HOW TO STORE THE SECONDARY FLIGHT PLAN

SELECT the DATA key on MCDU
PRESS the “STORED ROUTES” key
PRESS the “NEW ROUTE” key
ENTER the company route name (optional)
PRESS the “STORE SECONDARY F-PLN” key

Note: 1. *In either case, you may only store a company route if the active or secondary flight plan is complete from origin to destination.*
2. *If you do not enter a name, the FMGS automatically names the stored route as “SRTE 1 (or 2 ...)” when it is stored.*
3. *The system does not retain several elements of the flight plans, when they are stored:*
   - *Pilot-entered holds*
   - *Offsets*
   - *Pilot-entered constraints*
   - *Modifications to a terminal procedure*
   - *Pseudo waypoints*

   When this happens, it displays “REVISIONS NOT STORED”.
4. *If five routes are already stored the system will reject a new entry and display “STORED ROUTES FULL” on the MCDU. Delete one stored route by clearing the CO RTE name before inserting a new one.*

CLOSEST AIRPORTS

Ident.: DSC-22_20-60-80-00006018.0001001 / 07 APR 11

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The CLOSEST AIRPORTS page displays the four closest airports, from the position of the aircraft, found in the navigation database (*Refer to DSC-22_20-50-10-25 Closest Airports Pages*for the page description), and the 5th airport, as selected by the crew.

For each airport, the FM computes:
- The BRG/DIST/ESTIMATED UTC from the position of the aircraft to the corresponding airport.
- The EFOB at the airport, assuming an EFFECTIVE WIND (defaulted or entered by the pilot).

GENERAL

Ident.: DSC-22_20-60-90-00006019.0001001 / 16 FEB 11
Applicable to: ALL

The crew can enter a time marker in the F-PLN A or B page. Once entered, the FMGS displays a pseudo waypoint along the flight plan on the MCDU and on the Navigation Display. This pseudo waypoint shows the predicted location of the aircraft at the entered time.

HOW TO INSERT A TIME MARKER

Ident.: DSC-22_20-60-90-00009522.0001001 / 01 OCT 12
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

WRITE the time marker in the scratchpad. The entry format is HHMM.
SELECT any left key of the F-PLN A or B page, to insert the time marker in the active flight plan.

The time marker is inserted in the flight plan according to time criteria, irrespective of the key chosen for entry.

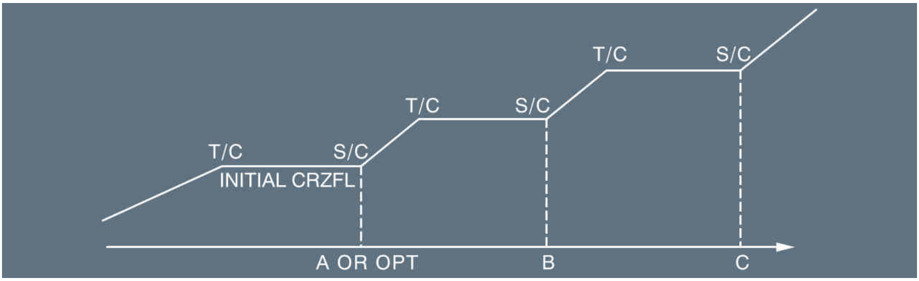
STEP CLIMB/STEP DESCENT

Ident.: DSC-22_20-60-100-00006020.0012001 / 12 APR 17

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The STEP ALTS function enables to define the successive cruise Flight Levels. The optimum position to initiate a climb, from the initial (or current) cruise Flight Level to the next one, can also be determined.



PRINCIPLE

GEOGRAPHIC STEPS

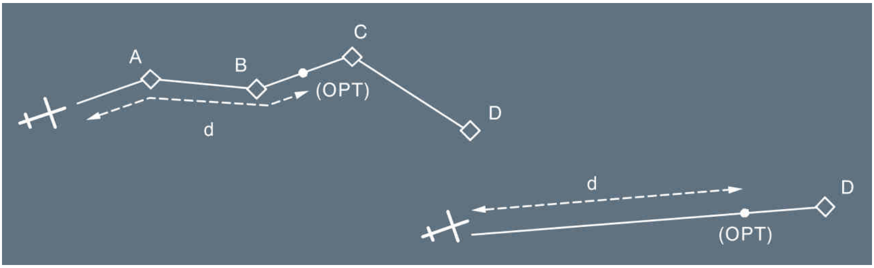
Up to four geographic steps may be defined on the STEP ALTS page. These steps are initiated at the geographical position, along the F-PLN.

Rules

- The minimum step size is 1 000 ft.
- A Step Climb (S/C) cannot follow a Step Descent (S/D).
- A STEP is automatically cleared, if:
  - The S/C (S/D) is sequenced without any level change done by the crew.
  - The crew achieves a LAT REV, which deletes the associated waypoint from the F-PLN
  - By EO condition.
- A STEP is manually cleared:
  - On the STEP ALTS page, by CLEARING the corresponding field.
  - On the F-PLN page, by CLEARING the (S/C) or (S/D) pseudo-waypoints.
- A STEP entry is IGNORED, if the remaining CRZ distance is less than about 50 NM.
- Once the steps are inserted in the F-PLN, they are displayed:
  - On the MCDU, as (S/C), (S/D), (T/C), (T/D) pseudo waypoints.
  - On the ND, by associated ↗, ↘, ↗, ↘ white symbols.

OPTIMUM STEP

When geographic steps are inserted, or an altitude is entered, the FM proposes an OPTIMUM STEP start of climb position for the first step climb altitude ahead. Predicted FUEL and TIME savings are displayed when calculated to be greater than 100 kg or 1 min respectively. If no savings are found, no optimum step is proposed.
The OPT STEP is not automatically inserted. The crew must insert it, if appropriate. Once inserted, the OPT STEP point (OPT) becomes a fixed geographical point.
If some F-PLN parameters are subsequently changed (e.g. winds, new waypoints), an update of the optimum position relative to the previous one may be proposed. If savings exist, this new optimum may be inserted to replace the previous optimum step point.
Once an OPT STEP is inserted in the F-PLN, and the crew achieves a lateral F-PLN revision, the FM keeps the (OPT) along the new F-PLN, at the same distance from the aircraft's position, as previously determined.



Rules

- The OPT STEP is only computed by the FM, if data required for the prediction computation are inserted : F-PLN, CRZ FL, CI, GW, CG at least.
- The search of the OPT STEP begins 20 NM beyond (T/C) before Cruise, or ahead of the aircraft's position.
- The search of the OPT STEP ends 20 NM before the next STEP POINT, or 300 NM before the (T/D).
- Only one OPT STEP is computed at a time.

Guidance

When reaching the step point, the steps must be initiated by the crew by selecting the new CRZ FL, and pressing the FCU ALT selector knob. If sequenced without any crew action, the step is automatically deleted.

If the crew initiates the step:

- The CRZ FL is automatically reassigned to its new value.
- The guidance is THR CLB/CLB for a step climb.
  THR IDLE/DES with V/S = -1 000 ft/min for a step descent.

STEP ENTRY

The STEP ALTS page is either accessed from the :

- The VERT REV page, or
- PERF CRZ page.

FOR GEOGRAPHIC STEP:

PRESS the F-PLN or PERF key.
SELECT vertical revision at a cruise waypoint.
SELECT the STEP ALTS prompt.

WRITE the ALT/WPT in the scratchpad, and ENTER it in [1L] to [4L].

Note:
- *The position may be a waypoint ident, PBD, PD.*
- *The pilot may enter FL 350/LMG/–20. The FM will compute the geographic step 20 NM before LMG to FL 350.*
- *To modify an inserted STEP:*
  - *To modify the CRZ FL only, enter it in the left key, as "FLXXX".*
  - *To modify the position only, enter it in the left key, as "/XXX".*
  - *To modify both, modify the position first, and then the CRZ FL (it is not possible to modify both in a single entry).*

CHECK the PREDICTIONS.

                         OPT STEP
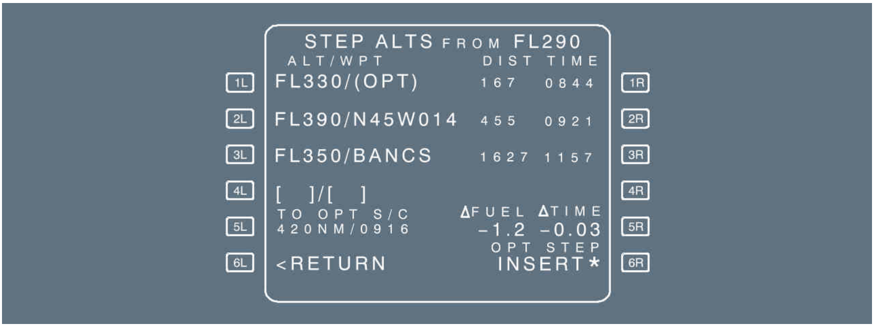
<RETURN                   UPDATE*
```

The computed (OPT) step replaces the initially inserted step position, and is then considered at a fixed geographic position. Savings are no longer displayed, and the UPDATE* prompt replaces the INSERT* prompt. This prompt allows the crew to update the (OPT) step position, considering possible F-PLN or inserted wind changes.

If pressed, a new OPT point is proposed, with the associated SAVINGS and INSERT prompt, or NO OPTIMAL.

UPDATE prompt has been pressed, the new OPT STEP point gives additional savings:



```

```

THERE ARE ONLY 2 CRZ FLS IN THE F-PLN:

The pilot may obtain the OPT position of the STEP point, as follows:

INSERT the initial cruise FL on the INIT A page.
ENSURE that the ZFW, ZFWCG and BLOCK fuel are inserted on the INIT B page.
WRITE the new CRZ FL in the STEP ALTS page, in the [1L] field.

Distance and time to optimum point and fuel/time saving are displayed.

CHECK the fuel and time savings and prediction on the [5R] field.

Savings are computed by comparing the entered step altitude, and the origin altitude of the step.

INSERT, if suitable.

MESSAGES

Messages may be displayed in the DIST/TIME field:
- "ABOVE MAX", if the inserted step altitude exceeds the REC MAX ALT.
  The "STEP ABOVE MAX FL" scratchpad message is associated to the "ABOVE MAX" message.
- "IGNORED"

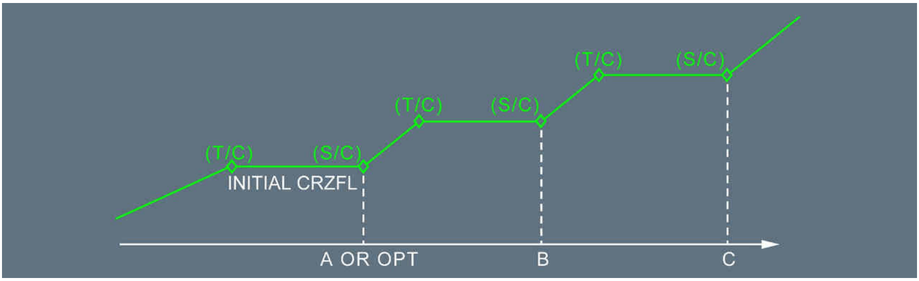
  This message is displayed in the following cases:
  - Step climb is located prior to the top of climb, or after the top of descent.
  - Step end is at less than 50 NM from the top of descent. An optimum step point, < 200 NM from top of descent, cannot be inserted

- “STEP AHEAD”, when the distance to the step point is less than 20 NM . A “STEP AHEAD” scratchpad message is also displayed.
  The following message may be displayed in the scratchpad:
- “NOT ALLOWED”, if:
  - Four steps already exist in the F-PLN, and an additionnal entry is attempted.
  - Any attempt to enter a step at the FROM waypoint, or at a pseudo waypoint is done.
  - Two consecutive steps are entered at the same waypoint (e.g. step climb after step descent).

STEP CLIMB/STEP DESCENT

Ident.: DSC-22_20-60-100-00006020.0011001 / 28 MAY 20
Applicable to: MSN 04827-04860

The STEP ALTS function enables to define the successive cruise Flight Levels. The optimum position to initiate a climb, from the initial (or current) cruise Flight Level to the next one, can also be determined.



PRINCIPLE

GEOGRAPHIC STEPS

Up to four geographic steps may be defined on the STEP ALTS page. These steps are initiated at the geographical position, along the F-PLN.

Rules

- The minimum step size is 500 ft
- A Step Climb (S/C) cannot follow a Step Descent (S/D).
- A STEP is automatically cleared, if:
  - The S/C (S/D) is sequenced without any level change done by the crew
  - The crew achieves a LAT REV, which deletes the associated waypoint from the F-PLN
  - By EO condition.

- A STEP is manually cleared:
  - On the STEP ALTS page, by CLEARING the corresponding field
  - On the F-PLN page, by CLEARING the (S/C) or (S/D) pseudo-waypoints
- A STEP entry is IGNORED, if the remaining CRZ distance is less than about 50 NM.
- Once the steps are inserted in the F-PLN, they are displayed:
  - On the MCDU, as (S/C), (S/D), (T/C), (T/D) pseudo waypoints
  - On the ND, by associated ↗, ↘, ↗, ↘ white symbols.

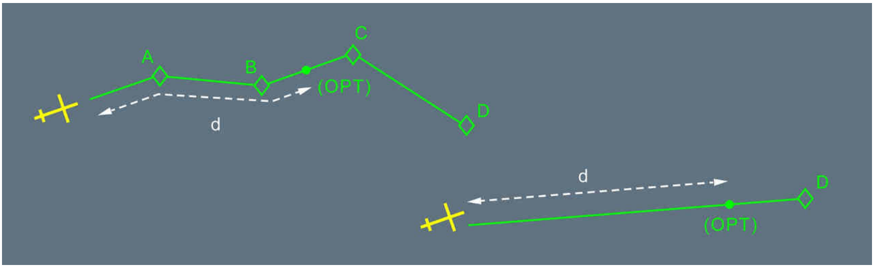
OPTIMUM STEP

When geographic steps are inserted, or an altitude is entered, the FM proposes an OPTIMUM STEP start of climb position for the first step climb altitude ahead. Predicted FUEL and TIME savings are displayed when calculated to be greater than 100 kg or 1 min respectively. If no savings are found, no optimum step is proposed.

The OPT STEP is not automatically inserted. The crew must insert it, if appropriate. Once inserted, the OPT STEP point (OPT) becomes a fixed geographical point.

If some F-PLN parameters are subsequently changed (e.g. winds, new waypoints), an update of the optimum position relative to the previous one may be proposed. If savings exist, this new optimum may be inserted to replace the previous optimum step point.

Once an OPT STEP is inserted in the F-PLN, and the crew achieves a lateral F-PLN revision, the FM keeps the (OPT) along the new F-PLN, at the same distance from the aircraft's position, as previously determined.



Rules

- The OPT STEP is only computed by the FM, if data required for the prediction computation are inserted : F-PLN, CRZ FL, CI, GW, CG at least
- The search of the OPT STEP begins 20 NM beyond (T/C) before Cruise, or ahead of the aircraft's position
- The search of the OPT STEP ends 20 NM before the next STEP POINT, or 300 NM before the (T/D)
- Only one OPT STEP is computed at a time.

Guidance

When reaching the step point, the steps must be initiated by the crew by selecting the new CRZ FL, and pressing the FCU ALT selector knob. If sequenced without any crew action, the step is automatically deleted.

If the crew initiates the step:
- The CRZ FL is automatically reassigned to its new value
- The guidance is THR CLB/CLB for a step climb or THR IDLE/DES with V/S = -1 000 ft/min for a step descent.

STEP ENTRY

The STEP ALTS page is either accessed from the :
- The VERT REV page, or
- PERF CRZ page.

FOR GEOGRAPHIC STEP:

PRESS the PERF key, or PRESS the F-PLN key and SELECT VERT REV at a cruise waypoint. SELECT the STEP ALTS prompt.

1. WRITE the ALT/WPT in the scratchpad
2. ENTER it in [1L] to [4L].

Note:
- *The position may be a waypoint ident, PBD, PD*
- *The crew may enter LMG/–20/350. The FMS will compute the geographic step to FL 350 20 NM before LMG*
- *To modify an inserted STEP:*
  - *To modify the CRZ FL only, enter it in the left key, as “FLXXX”*
  - *To modify the position only, enter it in the left key, as “/XXX”*
  - *To modify both, modify the position first, and then the CRZ FL (it is not possible to modify both in a single entry).*

CHECK the PREDICTIONS.

[   ]/[   ]

<RETURN
```

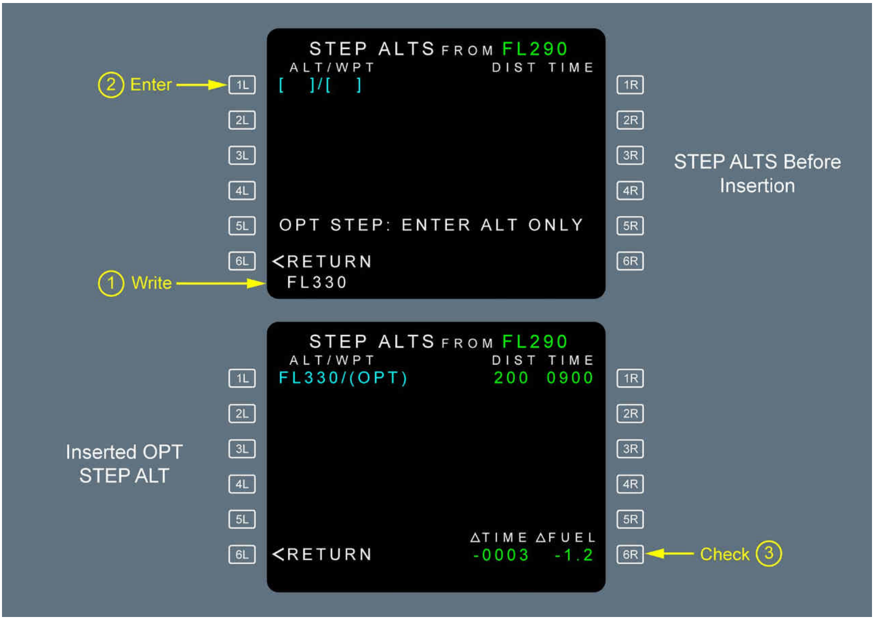
The computed (OPT) step replaces the initially inserted step position. Once inserted, the time and fuel savings associated to the optimal step are no longer displayed. The optimum step position is regularly updated until the aircraft is within 20 NM of the optimum step point.

Note: *If the circumstances lead to a situation where the entered optimal step is no longer optimal, "NO OPTIMAL" is displayed in the [1R] field.*

TO DETERMINE THE OPTIMAL STEP LOCATION WHEN THERE ARE ONLY 2 CRZ FLS IN THE F-PLN:

The crew may obtain the optimal position for the STEP as follows:

1. INSERT the initial CRZ FL on the INIT A page.
   ENSURE that the ZFW, ZFWCG and BLOCK fuel are inserted on the INIT B page.
2. ENTER the new CRZ FL in the STEP ALTS page in the [1L] field.
   If an optimal step can be determined, the FMGS automatically computes the optimal position of the step, with associated fuel/time savings.
3. CHECK the fuel and time savings and prediction on the [6R] field.
   Savings are computed by comparing the entered step altitude, and the origin altitude of the step.



```
STEP ALTS FROM FL290

MESSAGES

Messages may be displayed in the DIST/TIME field:

- “ABOVE MAX”, if the inserted step altitude exceeds the REC MAX ALT.
  The “STEP ABOVE MAX FL” scratchpad message is associated to the “ABOVE MAX” message.
- “IGNORED” displayed in the following cases:
  - Step climb is located prior to the top of climb, or after the top of descent.
  - Step end is at less than 50 NM from the top of descent. An optimum step point, < 200 NM from top of descent, cannot be inserted.
- “STEP AHEAD”, when the distance to the step point is less than 20 NM. A “STEP AHEAD” scratchpad message is also displayed.
- A “NOT ALLOWED” message is displayed in the scratchpad, if:
  - Four steps already exist in the F-PLN, and an additional step is entered.
  - A step is entered at the FROM waypoint, or at a pseudo-waypoint.
  - Two consecutive steps are entered at the same waypoint (e.g. step climb after step descent).

GENERAL

Ident.: DSC-22_20-60-110-00006021.0001001 / 01 OCT 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

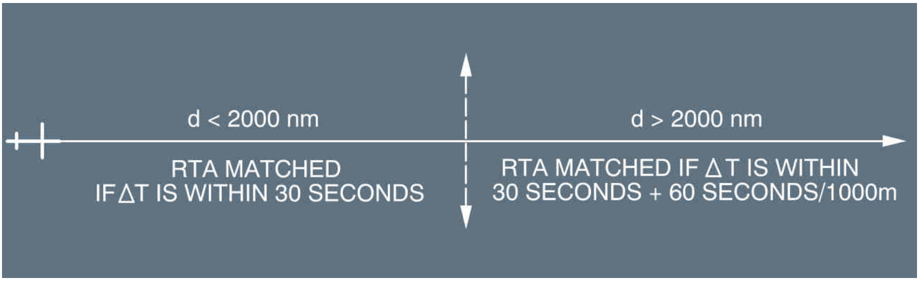
A time constraint (RTA) may be assigned at any waypoint of the F-PLN, downpath of the origin and the FROM waypoint. It can be an ”AT”, “AT OR BEFORE”, or “AT OR AFTER” constraint.
The FMS computes a new managed speed profile from the aircraft position to the constrained waypoint, in order to match the 30 s difference (ΔT) between the time predicted at the constrained waypoint and the RTA. This modified managed speed profile can be checked using the speed prediction, displayed for each waypoint of the F-PLN page.
The RTA function uses a speed range between Green Dot speed and VMO - 10 (or MMO - 0.02).
When the constrained waypoint is sequenced, the ECON SPD/MACH is resumed unless the constrained waypoint is located in a descent segment.

Note: *The FM does not compute a new managed speed profile when a RTA is entered in the descent profile while the aircraft is in cruise within 40 NM from the top of descent.*

The time constraint is inserted on the RTA page. A time constraint may be inserted at any waypoint of the primary or secondary flight plan.
If an engine-out condition is detected, the time constraint is automatically deleted and RTA DELETED message on scratchpad.
If the aircraft enters a holding pattern, the downpath time constraint is deleted.
Once inserted in the F-PLN, the RTA is displayed in magenta on the F-PLN page, as long as no predictions are available.

Once the predictions are available, the time constraint is replaced by the new predicted time at the associated waypoint, and highlighted by a star: (*)
- The (*) is magenta, if the time constraint is matched with the 30 s criteria.
- The (*) is amber, if the time constraint is missed.

Time constraint matching criteria:



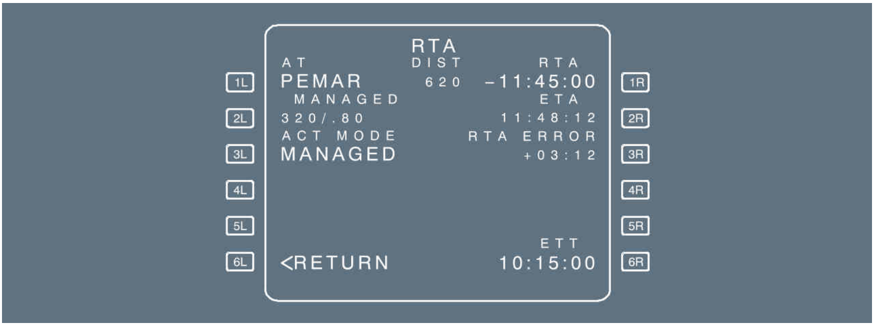
d < 2000 nm
d > 2000 nm
RTA MATCHED
IF ΔT IS WITHIN 30 SECONDS
RTA MATCHED IF ΔT IS WITHIN
30 SECONDS + 60 SECONDS/1000m

Note: *ΔT is the time difference between the time predicted at the constrained waypoint and the RTA.*

TIME CSTR ENTRY

PRESS the F-PLN key.
SELECT vertical revision at the revised waypoint.
SELECT the RTA key.
ENTER a waypoint at which a time constraint is to be defined.
WRITE the time constraint (+/–HHMMSS) into the scratchpad and ENTER

The display automatically reverts to the F-PLN A page.



```

                                     ETT
6L    <RETURN                   10:15:00    6R
```

Note: - *The TIME CSTR can be directly cleared on the F-PLN A page, using the CLR key.*
- *The time constraint is automatically deleted in the following cases:*
  - *Engine out, or*
  - *When entering a holding pattern, or*
  - *In case of Go-Around, or*
  - *A time constraint is entered at another waypoint, while another time constraint already exists.*

A scratchpad “RTA DELETED” message is displayed.

GENERAL

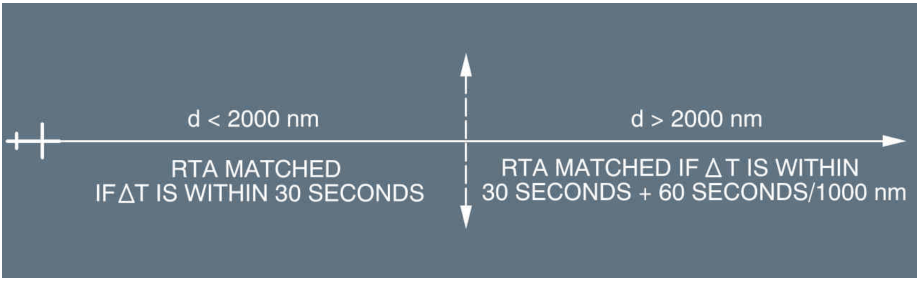
Ident.: DSC-22_20-60-110-00006021.0011001 / 01 OCT 12
Applicable to: MSN 04827-04860

A time constraint (RTA) may be assigned at any waypoint of the F-PLN, downpath of the origin and the FROM waypoint. It can be an ”AT”, “AT OR BEFORE”, or “AT OR AFTER” constraint.
The FMS computes a new managed speed profile from the aircraft position to the constrained waypoint, in order to match the 30 s difference (ΔT) between the time predicted at the constrained

waypoint and the RTA. This modified managed speed profile can be checked using the speed prediction, displayed for each waypoint of the F-PLN page.
The RTA function uses a speed range between Green Dot speed and VMO - 10 (or MMO - 0.02).
When the constrained waypoint is sequenced, the ECON SPD/MACH is resumed unless the constrained waypoint is located in a descent segment.
The time constraint is inserted on the RTA page. A time constraint may be inserted at any waypoint of the active or secondary flight plan.
If an engine-out condition is detected, the time constraint is automatically deleted and RTA DELETED message on scratchpad.
If the aircraft enters a holding pattern, the downpath time constraint is deleted.
Once inserted in the F-PLN, the RTA is displayed in magenta on the F-PLN page, as long as no predictions are available. On the PERF page, the Cost Index value is replaced by “RTA CI”.

Once the predictions are available, the time constraint is replaced by the new predicted time at the associated waypoint, and highlighted by a star: (*)
- The (*) is magenta, if the time constraint is matched with the 30 s criteria.
- The (*) is amber, if the time constraint is missed.

Time constraint matching criteria:



d < 2000 nm
d > 2000 nm
RTA MATCHED
IF ΔT IS WITHIN 30 SECONDS
RTA MATCHED IF ΔT IS WITHIN
30 SECONDS + 60 SECONDS/1000 nm

Note: *ΔT is the time difference between the time predicted at the constrained waypoint and the RTA. It is used to define the “missed” or “made” status.*

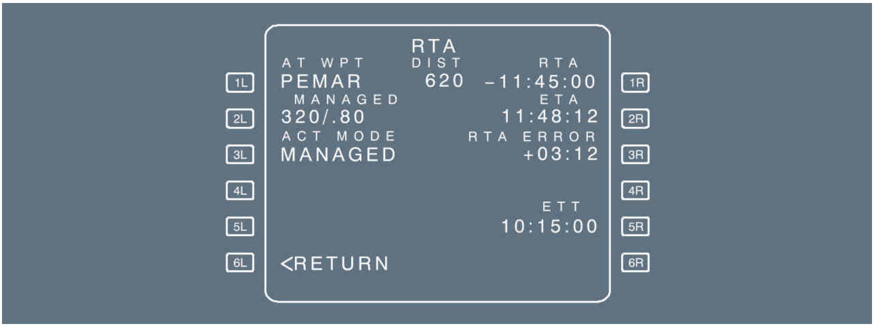
ENTRY OF A REQUIRED TIME OF ARRIVAL

PRESS the F-PLN key.
SELECT VERT REV at any waypoint.
SELECT the RTA prompt [2R].
ENTER the waypoint at which a time constraint is to be defined in the [1L] field

When accessing the RTA page, the [1L] field is defaulted to the waypoint at which the vertical revision has been performed.

WRITE the RTA in the scratchpad and ENTER in the [1R] field.

The format to be used is:
- *"HHMMSS" for "AT HHMMSS" (ex : "124500")*
- *"+HHMMSS" for "AT OR AFTER HHMMSS" (ex : "+124500")*
- *"-HHMMSS" for "AT OR BEFORE HHMMSS" (ex : "-124500")*



```
                    RTA
AT WPT             DIST          RTA
PEMAR               620    -11:45:00
  MANAGED                        ETA
320/.80                     11:48:12
ACT MODE                   RTA ERROR
MANAGED                       +03:12

                                 ETT
                            10:15:00
<RETURN
```

<u>*Note:*</u> - *The RTA can be directly cleared on the F-PLN A page, using the CLR key.*

The time constraint is automatically deleted in the following cases:
- *Engine out, or*
- *When entering a holding pattern, or*
- *In case of Go-Around, or*
- *A time constraint is entered at another waypoint, while another time constraint already exists.*
- *The waypoint where the RTA was entered is deleted.*

In case a time constraint is deleted, the "RTA DELETED" scratchpad message is displayed.

ESTIMATED TAKEOFF TIME (ETT)

Ident.: DSC-22_20-60-110-00009523.0001001 / 23 JUN 15
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The Estimated Takeoff Time (ETT) may be entered by the pilot during the preflight phase at the origin airport. This time is used as the initialization time for predictions.
The entry is accepted in the preflight phase, if the ETT is greater than the clock time.

PROCEDURE

PRESS the F-PLN key
SELECT a vertical revision at origin

SELECT the RTA page
WRITE the ETT into the scratchpad, and ENTER in the ETT field.

The display automatically reverts to the F-PLN A page.

Note:
- *If the current time exceeds the ETT entry, the CLK IS TAKE OFF TIME message is displayed ; the ETT is replaced by the clock time.*
- *At takeoff, the takeoff time is automatically updated using the actual clock time.*
- *An ETT entry is automatically deleted, if the origin airport is modified, or if the clock is inoperative.*
- *If a time constraint is entered at a waypoint in the F-PLN, the takeoff time required to match the constraint is automatically computed by the FM. This result is displayed in magenta as ETT at the origin.*

USE OF TIME/ETT CONSTRAINT

During preflight :
- If an ETT has been entered, time predictions are based on the entered value (or clock time, if greater).
- If both an ETT and a time constraint have been entered, time predictions are based on the entered ETT value (or clock time, if greater). The managed speed profile is computed to match the time constraint, as closely as possible, using a pseudo cost index value. (Not displayed).
- If only a time constraint has been entered:
  - Optimum speeds are computed to determine the ETT, so as to satisfy the time constraint.
  - If necessary, flight time (based on optimum speeds) plus clock time (current) is greater than the time constraint ; optimum speeds are modified to match the time constraint as closely as possible.

After Takeoff : The predictions are based on the current time.
Speeds are adjusted to satisfy the time constraint.

ESTIMATED TAKEOFF TIME (ETT)

Ident.: DSC-22_20-60-110-00009523.0011001 / 23 JUN 15
Applicable to: MSN 04827-04860

The Estimated Takeoff Time (ETT) may be entered by the pilot during the preflight phase at the origin airport. This time is used as the initialization time for predictions.
The entry is accepted in the preflight phase, if the ETT is greater than the clock time.
No temporary flight plan is created upon insertion or modification of an ETT

PROCEDURE

PRESS the F-PLN key

SELECT VERT REV at departure
SELECT the RTA prompt [2R]
ENTER the ETT in the [5R] field of RTA page

Note:
- *If the current time exceeds the ETT entry, the CLK IS TAKE OFF TIME message is displayed ; the ETT is replaced by the clock time.*
- *At takeoff, the takeoff time is automatically updated using the actual clock time.*
- *An ETT entry is automatically deleted, if the origin airport is modified, or if the clock is inoperative.*
- *If a time constraint is entered at a waypoint in the F-PLN, the takeoff time required to match the constraint is automatically computed by the FM. This result is displayed in magenta as ETT at the origin.*

USE OF TIME/ETT CONSTRAINT

During preflight :
- If an ETT has been entered, time predictions are based on the entered value (or clock time, if greater).
- If both an ETT and a time constraint have been entered, time predictions are based on the entered ETT value (or clock time, if greater). The managed speed profile is computed to match the time constraint, as closely as possible, using a pseudo cost index value. (Not displayed).
- If only a time constraint has been entered:
  - Optimum speeds are computed to determine the ETT, so as to satisfy the time constraint.
  - If necessary, flight time (based on optimum speeds) plus clock time (current) is greater than the time constraint ; optimum speeds are modified to match the time constraint as closely as possible.

After Takeoff : The predictions are based on the current time.
Speeds are adjusted to satisfy the time constraint.

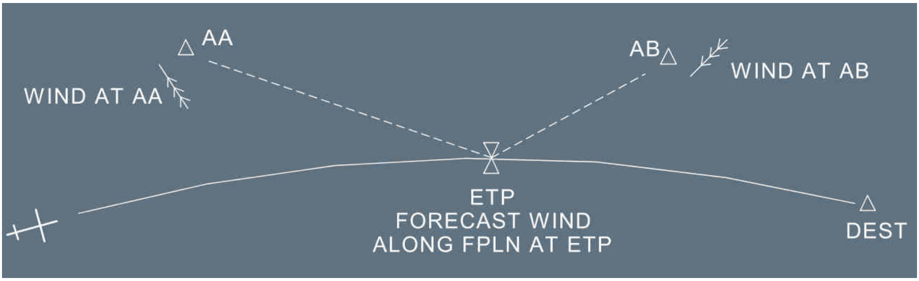
EQUITIME POINT

Ident.: DSC-22_20-60-120-00006015.0001001 / 16 MAR 11

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The equitime point page displays the ETP, computed along the F-PLN route between two referenced positions (airports, waypoints or navaids), defined by the pilot (*Refer to DSC-22_20-50-10-25 Equi - Time Point Page*for the page description).
When first accessing the page, the FMS proposes origin and destination airfields, as defaulted positions.
The pilot may overwrite these two positions and insert the wind in their vicinity at the applicable CRZ FL.
The FMS then computes the resulting ETP, using the managed or selected speed, and blending the forecasted winds along the F-PLN route with the inserted winds.

The FMS provides:
- TIME and DIST from the aircraft position (or origin on ground) to the ETP
- The BRG/DIST from the ETP to the defined positions
- TIME overhead each position, assuming the aircraft flies from the present position to the defined position via the ETP
- (ETP) pseudo waypoint is displayed on the ND along the F-PLN
- ETP location in relation to the subsequent waypoint.



EQUITIME POINT

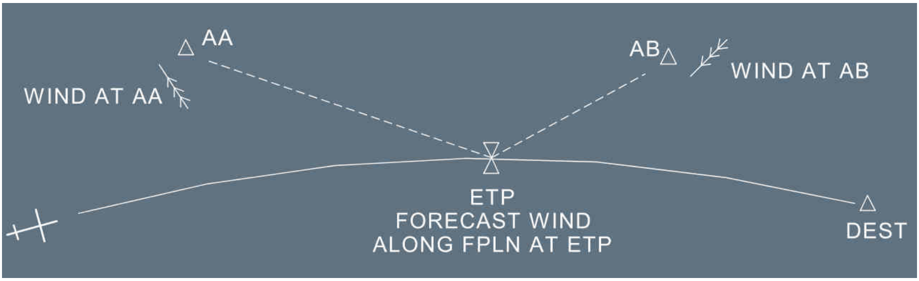
Ident.: DSC-22_20-60-120-00006015.0002001 / 18 MAR 11

Applicable to: MSN 04827-04860

The EQUI-TIME POINT page displays the ETP, computed along the F-PLN route between two referenced positions (airports, waypoints or navaids), defined by the crew (*Refer to DSC-22_20-50-10-28 EQUI - TIME POINT Page*for the page description).
When first accessing the page, the FMS proposes origin and destination airfields, as defaulted positions.

The pilot may overwrite these two positions and insert the wind in their vicinity at the applicable CRZ FL.
The FMS then computes the resulting ETP, using the managed or selected speed, and blending the forecasted winds along the F-PLN route with the inserted winds.

The FMS provides:
- TIME and DIST from the aircraft position (or origin on ground) to the ETP
- The BRG/DIST from the ETP to the defined positions
- TIME overhead each position, assuming the aircraft flies from the present position to the defined position via the ETP
- (ETP) pseudo waypoint is displayed on the ND along the F-PLN
- ETP location in relation to the subsequent waypoint.



EQUITIME POINT ENTRY

Ident.: DSC-22_20-60-120-00009536.0001001 / 01 OCT 12

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

PRESS the DATA key.
SELECT the EQUI-TIME POINT prompt.

The EQUI-TIME POINT page is displayed. The origin and destination airports are used by default.

ENTER the REF POINT 1 in the [1L] field.
ENTER the associated wind in the [2L] field.

The wind to be inserted is the wind in the vicinity of the reference point at the CRZ FL.

ENTER the REF POINT 2 in the [3L] field.
ENTER the associated wind in the [4L] field.

The system displays the ETP location with regards to the next waypoint of the active flight plan following the ETP in the [5R] field, and the A/C TO (ETP) predictions in the [6R] field.

GENERAL

Ident.: DSC-22_20-60-130-00012906.0011001 / 24 FEB 14

Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

The MCDU NAV B/UP allows to link a MCDU to its associated IRS in order to allow the flight crew to monitor the navigation and to be provided with some basic flight planning functions in case of FM 1 + 2 failure.

CAUTION	The MCDU NAV B/UP is to be used only in case of FM 1 + 2 failure. It can be selected temporarily in case of FM1 or 2 only failure, in order to ensure that the function is available on the failed side. When in MCDU NAV B/UP on both sides, one FG at least must be available to engage AP and A/THR.

The MCDU NAV B/UP function provides:
- Aircraft position using onside IRS or IRS 3
- Aircraft position using GPIRS ◁ position
- F-PLN as memorized in the MCDU
- F-PLN display on ND
- F-PLN automatic sequencing
- Limited lateral revisions
- Mag (True) bearing depending on the pilot selection, from aircraft position to the TO WPT and associated distance
- True track between waypoints
- Time estimates computed with current GS from onside IRS
- Total time and distance to destination

The following features are not provided:
- No DATA BASE available:
  - No autotuning, NAVAIDS must be selected on RMP
  - No radio position
  - No EFIS CTL PANEL options
  - No LDG ELEV (must be manually selected on overhead panel).
- No performance data:
  - No CLB/DES/APP NAV/FINAL modes
  - No SPEED MANAGED
  - No automatic SPD/MACH change over.
- Most of predictions are lost:
  - No EFOB
  - No XTRA
  - No ETA at DEST.
- No multiple lateral F-PLN

- No AP/FD managed modes
- No crosstalk between MCDUs: F-PLN revisions have to be achieved on both MCDUs.

BACK UP NAV SELECTION

Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_20-60-130-A-00012907.0011001 / 16 FEB 11

2

FM F-PLN DOWNLOAD IN MCDU

While BACK UP NAV is not active, the FM downloads permanently a condensed form of the F-PLN in the MCDU.

Downloaded information include:
- Waypoint position
- Waypoint identifier
- Leg type
- Discontinuity
- Overfly
- Turn direction.

Heading legs, course to fix legs, ..., computed INTCPT positions, pseudo waypoints, ..., cannot be downloaded.
They are replaced by discontinuities.
Maximum of 150 waypoints are downloaded.

Ident.: DSC-22_20-60-130-A-00012908.0011001 / 14 MAY 12

BACK UP NAV OPERATION

Ident.: DSC-22_20-60-130-B-00012909.0011001 / 16 FEB 11

4 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

AP AND A/THR

One FG at least must be available to allow the engagement of AP/FD and A/THR. All FM managed modes are lost as well as managed speed.

As a consequence:
- LAT F-PLN is flown in HDG/TRK modes
- VERT F-PLN is flown in OPEN/V/S/FPA modes
- SPD TARGET is manually SELECTED on the FCU
- SPD/MACH crossover is manually SELECTED on the FCU.

It is recommended to use the TRK/FPA modes:

SELECT the required TRK on FCU at waypoint sequencing (as no AP/FD coupling exists in NAV B/UP). F-PLN sequencing is automatic.
MONITOR the track of the next leg prior reaching the TO waypoint (track between TO and next waypoints is true track).
ADJUST the track to follow the F-PLN with X-TRK = 0
USE OP DES or FPA to descend as suitable.

FPA allows easy altitudes predictions:
DNM = Δ(FL)/FPA°

Ident.: DSC-22_20-60-130-B-00012910.0011001 / 16 FEB 11

5 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

NAVIGATION MONITORING

The navigation accuracy check must be achieved periodically using the same principle as with FM navigation:

COMPARE computed data with raw data
SELECT ON RMP the applicable navaid
PRESS the [PROG] key

B/UP PROG page is displayed

WRITE in the scratchpad then ENTER the navaid LAT/LONG
SELECT associated navaid needle on the EFIS control panel.
COMPARE computed BRG/DIST with RAW DATA on ND

- *If the crosscheck is POSITIVE the ND may be used in ROSE NAV/MAP modes with raw data*
- *If the crosscheck is NEGATIVE the ND must be used in ROSE VOR/ROSE ILS modes.*

Note: *B/UP IRS ◁ and B/UP GPS ◁ pages may also be used to check the position.*

Ident.: DSC-22_20-60-130-B-00012911.0011001 / 16 FEB 11

6 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

FLIGHT PLANNING

The following revisions may be achieved:
- WPT insertion/deletion
- OVERFLY insertion/deletion

- DIR TO a waypoint
- CLR waypoints/discontinuities.

Waypoint identifiers are either published waypoint identifiers if present in the MCDU active F-PLN, or coded LAT/LONG identifiers resulting from flight crew entries.
All flight planning functions are directly applied on active F-PLN without LAT REV page.

Ident.: DSC-22_20-60-130-B-00012912.0011001 / 23 JUN 15

7 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

WAYPOINT INSERTION

Waypoint insertion into the F-PLN is performed via the B/UP F-PLN page by selecting the line key adjacent to the desired point of insertion, whenever a pre-existing waypoint identifier or valid IDENT/LAT/LONG or LAT/LONG entry is displayed in the scratchpad.
Any waypoint entry which causes the number of legs in the route to exceed the maximum allowed results in the "F-PLN FULL" message.

In this example, the entered DIR TO waypoint is a LAT/LONG waypoint.
Due to the fact that this new waypoint is not identical to any waypoint in the F-PLN, a direct leg to that waypoint is created and followed by a discontinuity.
When the DIR TO function is completed, the B/UP F-PLN page is displayed with the DIR TO waypoint as the TO waypoint and the T-P waypoint as the FROM waypoint.
If a DIR TO function is achieved for a waypoint that belongs to the B/UP F-PLN, no F-PLN discontinuity is created.

Note: - *In case of a DIR TO waypoint associated with an OVERFLY condition, the OVERFLY is kept.*

DIRECT TO A WAYPOINT

The DIR TO function operates as for the normal F-PLN, except that RADIAL INTERCEPT and ABEAM functions are not available.

PRESS the DIR key.
WRITE LAT/LONG (or IDENT/LAT/LONG) on the scratchpad then INSERT in [1L].
SELECT the correct track on the FCU in order for the aircraft to turn toward the new TO waypoint.

B/UP F-PLN PAGE AFTER A DIR TO ENTRY (LAT/LONG ENTRY)

In this example, the entered DIR TO waypoint is a LAT/LONG waypoint.
Due to the fact that this new waypoint is not identical to any waypoint in the F-PLN, a direct leg to that waypoint is created and followed by a discontinuity.
When the DIR TO function is completed, the B/UP F-PLN page is displayed with the DIR TO waypoint as the TO waypoint and the T-P waypoint as the FROM waypoint.
If a DIR TO function is achieved for a waypoint that belongs to the B/UP F-PLN, no F-PLN discontinuity is created.

Note: - *In case of a DIR TO waypoint associated with an OVERFLY condition, the OVERFLY is kept.*

ILS APPROACHES

Only CAT 1 approaches may be flown since the DH indication is not available.

CHECK the ILS frequency and course on the RMP.
PUSH the LS pb on the EIS control panel.

The autopilot and flight director available modes are APP (LOC – G/S – LAND)
The autothrottle available speed target is selected speed

CHECK VAPP in the QRH.

GENERAL

Ident.: DSC-22_20-60-140-00006025.0001001 / 16 FEB 11
Applicable to: MSN 02887

When a flight is scheduled to cross high latitude areas (usually beyond 60° N or S,) various precautions must be taken regarding ADIRSs, FMGSs, and EIS.

These precautions are mostly dictated by :
- The change from the MAG to TRUE heading (track) reference required by the airway reference changes at high latitudes, or the unavailability of magnetic variation at high latitudes.
- Some particularities linked to the pole overfly.

DESCRIPTION

Ident.: DSC-22_20-60-140-00009534.0001001 / 01 OCT 12
Applicable to: MSN 02887

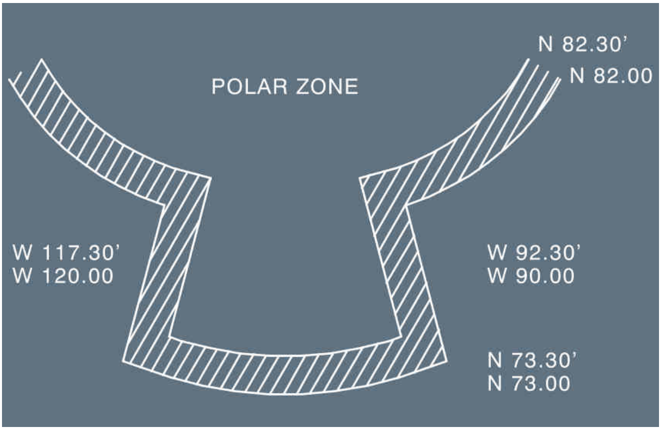
ADIRS

ALIGNMENT :

The IRS may be aligned up to latitude 73N without any particular procedures.
Between 73N and 82N (north or south), the required alignment time is greater and a specific procedure has to be performed.
Beyond 82 ° North or South, no ADIRS alignment is possible.

MAG-TRUE REFERENCE SELECTION :

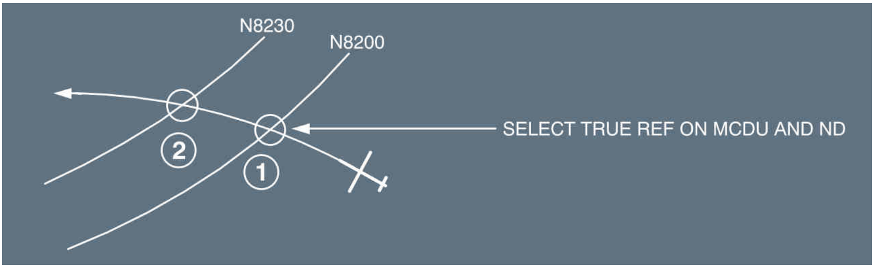
The ADIRS are able to provide TRUE heading (track), regardless of the aircraft latitude.
The ADIRS are able to provide MAG heading (track) between latitudes 82°30 N and 60°30 S, except in the vicinity of the magnetic pole, as shown below :



POLAR ZONE
N 82.30'
N 82.00
W 117.30'
W 120.00
W 92.30'
W 90.00
N 73.30'
N 73.00

Note: 1. *The latitude values given in this diagram are average values. In reality, the polar area involves different hysteresis, combined with the track angle penetration of the aircraft in the zone.*
2. *All airfields where STARs and approaches are MAG referenced — such as Svalbard — will be flown with magnetic reference selected.*
3. *Although located outside the polar zone, Thule is “TRUE” oriented.*

The MAG/TRUE selection is achieved manually by pressing the NORTH REF pushbutton, or automatically if the aircraft enters the polar zone with MAG still selected. In this case the following messages and cautions are displayed.



N8230
N8200
SELECT TRUE REF ON MCDU AND ND
②
①

When in 1, the “SELECT TRUE REF” amber message is displayed on the ND and MCDU scratchpad.

When in 2, and MAG reference is still selected, following events will occur :
- The IRSs automatically revert from MAG to TRUE
- A TRUE indication appears on the ND and PFD heading scales. The GRID track information appears on ND.
- The autopilot might disconnect, an amber caution NAV HDG DISCREPANCY (associated with a CHECK HDG message on the PFD and on the ND) might be triggered (the IRS do not reach the polar zone simultaneously).

Note: *The messages and cautions are triggered as soon as the first IRS reaches the polar zone ; when the other two IRSs enter the polar zone, the messages are no longer displayed.*

FMGS

- Flight Guidance part
  - When the pilot manually changes the heading reference from MAG to TRUE or vice versa.
    - ■ if NAV mode is engaged, there is no discontinuity in the lateral guidance
    - ■ if HDG (TRK) modes are engaged, the HDG (TRK) target is automatically modified using current position variation; thus there is no discontinuity in the lateral guidance
  - When TRUE reference is selected, only CAT I ILS approaches may be flown
  - if an automatic MAG/TRUE switching occurs when entering the Polar zone, the autopilot might disengage due to the fact that most probably, the automatic switching will not occur simultaneously for the 3 IRSs. The AP OFF warning is displayed on the ECAM.
- Flight Management part
  - When the aircraft reaches 78 N (60 S), the aircraft position is computed using XYZ earth centered Cartesian coordinates.
    This allows the FM to continuously provide, a MIX IRS position regardless of latitude, the FM position being linked to the MIX IRS position.
  - During preflight phase, if TRUE reference is selected (takeoff with TRUE reference is rare), the pilot is reminded of this selection by :
    - ■ CHECK NORTH REF amber message on ND and MCDU scratchpad if the origin airport reference does not match the one selected by the pilot.
    - ■ TRUE label above PFD/ND heading scales flashes for 10 s at slats extension.
    - ■ TRUE NORTH REF memo message flashes for 10 s at engine start or at slat extension.
  - Before approach, the pilot is reminded of the correct TRUE/MAG selection by :
    - ■ CHECK NORTH REF amber message on ND and MCDU scratchpad if the destination airport reference in database does not match the one selected by the pilot and the aircraft reaches the arrival area (approximately 25 NM from destination airport).
    - ■ If true is selected, TRUE label pulses on PFD/ND during 10 s at slats extension, as well as the TRUE NORTH REF message on ECAM (as a reminder).
  - The tracks and bearings, provided on the MCDU F-PLN, PROG... pages are computed TRUE or MAG referenced, according to the TRUE/MAG cockpit selection
    - ■ if selection is TRUE, the bearing and track figures are displayed followed by a T.
  - if the pilot wishes to create a PBD, PB/PB waypoint or define a radial (DIR TO INTCPT), the rule for bearing or radial entry is as follows :
    - ■ if the bearing is inserted without specifying its reference, the reference is the one corresponding to the cockpit selection

- if the bearing is inserted with its specified reference (M for magnetic, T for true), the bearing is so defined : e.g. TOU/350 T/15.

EIS PFD/ND

TRUE/MAG REFERENCE INDICATION

The TRUE/MAG reference selection is indicated by a specific label displayed above the heading scales of both EFIS DUs:

- If MAG is selected (which is the most common situation) no label is provided ; the bearing to the TO waypoint on the ND is displayed with the digits only
- If TRUE is selected (manually or automatically), a TRUE label is provided above PFD/ND heading scales.

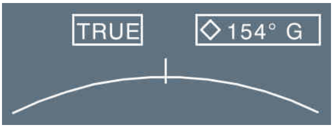
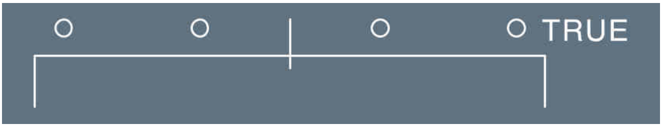
- The GRID TRACK appears on the ND in all modes except in PLAN mode if no approach title is displayed.

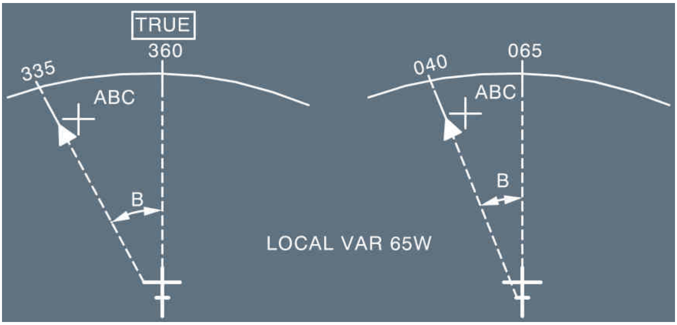


Note: *If the ILS scale is displayed on PFD, the TRUE message is shifted on the right side.*



ADF AND VOR BEARING DISPLAY

- The ADF needle represents the relative bearing between the aircraft and the NDB.
  The ADF relative bearing information (B) is thus independant of the TRUE/MAG selection, and the needle is always pointing to the same direction whatever is the selection.
  Furthermore (provided FM position is accurate) when the EFIS ND is in ARC or ROSE NAV modes, the ADF needle will point towards the NDB symbol as provided by the FMS.



Note: the same reading is available on the DDRMI.

- The VOR bearing is measured by the VOR, at the VOR location :
  - it is a TRUE bearing if the VOR station is TRUE referenced
  - it is a MAG bearing if the VOR station is MAG referenced.

  When the ND display mode is ARC or ROSENAV, the FM computed data (aircraft position, F-PLN legs, NAVAID position symbol...) are provided along with VOR needles, if selected.

  → It is important in these display modes, that there is a consistency between the FM data and the VOR raw data.
  Hence, if the cockpit NORTH REF selection does not match the VOR station reference, there may be a discrepancy between the VOR raw data and the FM data, unless a correction is applied to the VOR data.

PRINCIPLE

When the ND is in ARC/ROSE NAV mode, if there is a mismatch between the NORTH REF selection and the VOR station reference, the VOR needle is equal to the VOR raw bearing corrected by the local variation at the aircraft present position.
In that case, the needle is displayed in magenta colour, the label CORR (corrected) is displayed in magenta in the lower corner of the ND.
In all other ND display modes (ROSE VOR, ROSE ILS), the VOR raw data (with no correction) is displayed. MAG or TRUE (amber) is displayed next to the VOR identifier when its reference does not match the cockpit selection.

EXAMPLE:

Local variation 65W – TL is a magnetic referenced VOR.

Note: *ND in ROSE VOR/ROSE ILS modes and DDRMI VOR bearing indications are always identical.*

DDRMI

The heading provided by the DDRMI is directly linked to the NORTH REF cockpit selection.

The VOR bearing indications are raw data, as provided by the station.

PROCEDURES

Ident.: DSC-22_20-60-140-00009535.0001001 / 23 DEC 14
Applicable to: MSN 02887

IRS ALIGNMENT

- **When a high latitude flight or polar flight is planned, it is most probably a long range type of a flight.**

  DELAY the completion of IRS aligment as long as possible.

  Prior to pressing the ALIGN IRS prompt, SLEW the origin airport reference coordinates to the gate coordinates, if published.

- **When the origin airport is located between latitude 73° N and 82° (North or South), IRS alignment should last at least 15 min. Consequently :**

  SET IRS selectors to NAV

  START the STOP WATCH

  ADJUST the origin airport coordinates to the gate coordinates, if published.

  PRESS the ALIGN IRS prompt, after the 15 NM countdown or later.

  Note: *Beyond 82° North or South, no ADIRS alignment is possible.*

FLIGHT

- **Takeoff :**

  If the “CHECK NORTH REF” amber message comes up on the ND and MCDU, verify that the NORTH REF selection matches the origin airport reference.

  Note: *The “CHECK NORTH REF” amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.*

- **Cruise :**

  When reaching an area where the heading reference should be changed (oceanic area, airway or polar track defined in TRUE reference, ...) ;

  SELECT TRUE by pressing the NORTH REF pushbutton.

  When reaching 65 N with TRUE reference selected, the GRID TRACK is provided on the ND’s upper right box. The ND compass still displays true track and heading.
  GRID TRK along with XTK are the cues to be used to monitor the proprer lateral guidance.

If the “SELECT TRUE” message appears on the ND/MCDU, this indicates that the aircraft has reached the Polar zone with MAG reference still selected in the cockpit.
Press the NORTH REF pushbutton to select TRUE.

Note: *If this is not achieved, an automatic switching will subsequently occur. The AP will most probably disengage with associated warnings.*
In such a case :
Press the NORTH REF pushbutton to select “TRUE”.
Re-engage the AP.

- Use of VOR/DME

  En route, the VOR/DME are basically used for either FM NAV ACCY crosscheck, or for reporting a given radial to the ATC.

  The FM NAV ACCY crosscheck is achieved, as usual, by comparing the bearing/distance that is displayed on the ND, with the bearing/distance that is displayed on the PROG page.

  In case the VOR used is defined in another reference (e.g. MAG) than the one selected in the cockpit (e.g. TRUE), the bearing that is provided on ND is in magenta and is corrected. The VOR-corrected bearing should be within 5 ° of the FM-computed bearing (taking into account the meridian convergence and the difference in magnetic variation).

  → In case of doubt, set the NORTH REF to the VOR reference, and check the bearings.

CAUTION	The correction of VOR indications in ROSENAV or ARC ND modes depend on a correct navigation database coding. If the North reference (TRUE/MAG) that is coded for the VOR orientation is not correct, the VOR indication correction will be unduly applied. If VOR needles are in magenta (CORR), check both the aircraft NORTH REF selection and the VOR station orientation on the navigation charts.

  If the aircraft has to report on a given VOR radial, which is defined in a different reference (e.g. MAG) from the cockpit reference (e.g. TRUE), check the RADIAL crossing on the PM ND set to ROSE VOR mode, or use DDRMI. (Ex: The aircraft flies NCA 24) : (NCA 24 is the TRUE referenced route). ATC requests the aircraft to report on RADIAL 357 from YZF (MAG-referenced).

- Use of ADF
  The Polar Zone NDBs are quite powerful, and the bearing can be received at long distances.
- Use these NDBs to check the reasonableness of the FM navigation by comparing the ADF bearing, that is displayed on the ND, with the FM-computed bearing, that is displayed on the PROG page.

- Flying the pole
  - In most case, the autopilot will be in NAV mode.
    When approaching the pole, a CHECK HDG message appears, with the associated ECAM Procedure.
    - ■ Disregard the ECAM Procedure.
      The message is due to the fact that the IRSs do not reach the pole simultaneously ; thus the headings do not turn simultaneously from 360 to 180 °.
  - In case HDG mode is used (e.g FM1 + 2 failed and Back Up Nav as installed is used)
    - ■ The autopilot onside that the best IRS is to be engaged.
      The offside HDG bug (▿) should be disregarded when close to the pole since, the IRS headings may differ.

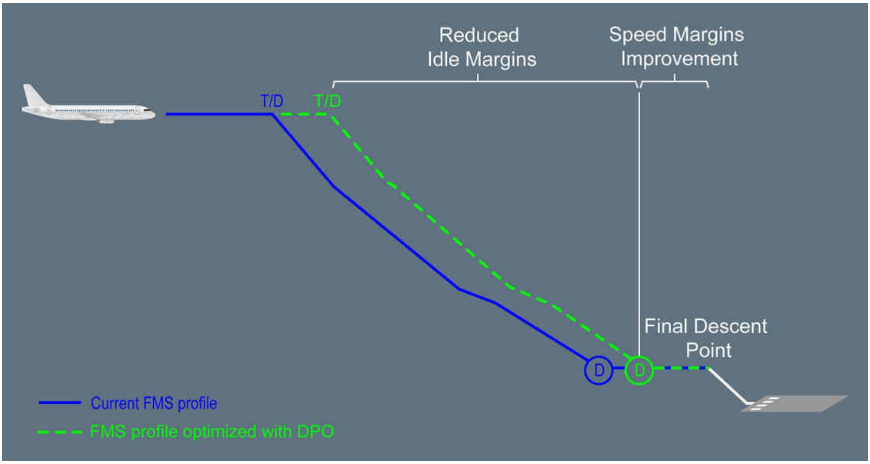
- Approach
  - If CHECK NORTH REF amber message comes up on ND and MCDU, verify that the NORTH pushbutton is selected to the destination airport reference.

    Note: *The "CHECK NORTH REF" amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.*
  - If TRUE is selected for approach, only CAT I ILS approaches may be flown.

DESCENT PROFILE OPTIMIZATION ◁

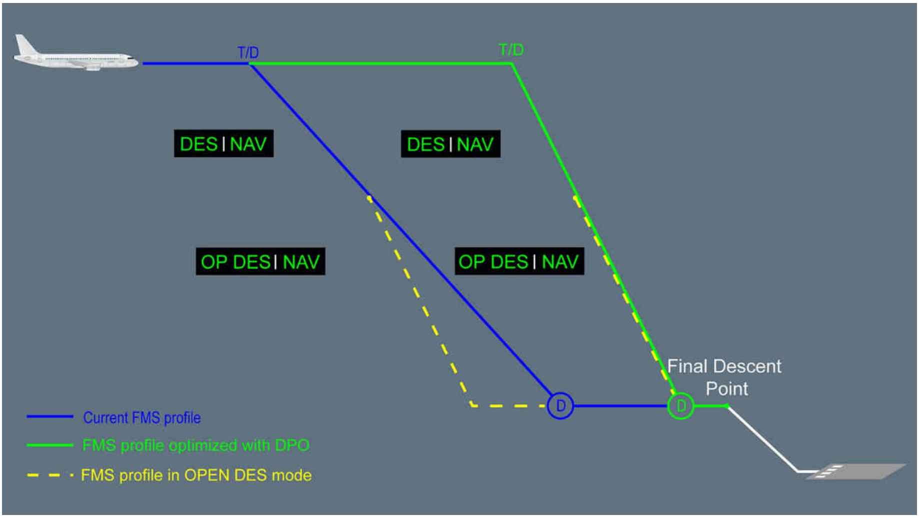
Ident.: DSC-22_20-60-150-00019723.0001001 / 07 JUN 16
Applicable to: ALL

During the idle segment in descent, margins are added to the idle thrust to have more flexibility to maintain the aircraft on the computed descent profile in case of external perturbations such as important wind change.
The Descent Profile Optimization (DPO ◁) optimizes the computed vertical profile. It decreases the idle thrust margins in descent and the speed margins in approach to reduce fuel burn in descent phase.
With DPO ◁ , the computed vertical profile is steeper. The T/D is reached later. Before the final approach, the deceleration level-off is shorter.



Reduced
Idle Margins
Speed Margins
Improvement
T/D
T/D
Final Descent
Point
D
D
Current FMS profile
FMS profile optimized with DPO

With DPO ◁ , along the idle segment, without altitude constraint, the descent profile computed by the FMS is the same as the one flown in OPEN DES mode. Therefore, reverting in OPEN DES mode during the descent does not change the descent rate.



T/D
T/D
DES | NAV
DES | NAV
OP DES | NAV
OP DES | NAV
Final Descent Point
D
D
Current FMS profile
FMS profile optimized with DPO
FMS profile in OPEN DES mode

With DPO ◁✱ , the FMGS has less flexibility to maintain the aircraft on the computed vertical profile in case of difference between wind entry and effective wind. Therefore, the accurate winds have to be entered in the FMGS before descent.

During descent, the VDEV should be closely monitored. If the aircraft goes above the flight descent profile, the flight crew may have to extend speed brakes to go back on the computed descent profile.

If ENG ANTI ICE or ENG ANTI ICE + WING ANTI ICE are used during descent (inducing an increased idle thrust), the flight crew may have to extend speed brakes to stay on the computed descent profile.

ADIRS

MAG-TRUE REFERENCE SELECTION

The ADIRS are able to provide TRUE heading (track), regardless of the aircraft latitude.
The ADIRS are able to provide MAG heading (track) up to N 82 ° or S 60 °.
The MAG/TRUE selection is achieved manually by pressing the NORTH REF pb.

Note: *1. All airfields where STARs and APPRs are MAG referenced - such as Svalbard - will be flown with magnetic reference selected.*
2. Although located outside the above polar zone, Thule is "TRUE" oriented.

Ident.: DSC-22_20-65-A-00013374.0001001 / 02 MAY 23

1 FMGS

- Flight Guidance part
  - When the flight crew manually changes the heading reference from MAG to TRUE or vice versa:
    - If NAV mode is engaged, there is no discontinuity in the lateral guidance
    - If HDG (TRK) modes are engaged, the HDG (TRK) target is automatically modified using current position variation; thus there is no discontinuity in the lateral guidance
  - When TRUE reference is selected, only CAT I ILS approaches may be flown

- Flight Management part
  - When the aircraft reaches 78 N (60 S), the aircraft position is computed using XYZ earth centered Cartesian coordinates:
    This allows the FM to continuously provide, regardless of latitude, a MIX IRS position, the FM position being linked to the MIX IRS one.
  - During preflight phase, if TRUE reference is selected (takeoff with TRUE reference is rare),the pilot is reminded of this selection by:
    - CHECK NORTH REF message on ND and MCDU scratchpad if the origin airport reference does not match the one selected by the flight crew.
    - TRUE label above PFD/ND heading scales flashes for 10 s at slats extension.
  - Before approach, the flight crew is reminded of the correct TRUE/MAG selection by:
    - CHECK NORTH REF message on ND and MCDU scratchpad if the destination airport reference in database does not match the one selected by the flight crew and the aircraft reaches the arrival area (approximately 25 NM from destination airport).
    - If true is selected, TRUE label pulses on PFD/ND during 10 s at slats extension.

    Note: *If the flight crew selects TRUE reference whereas the selected approach is defined in MAG reference in the FM navigation data base, the NAV mode will disengage at the entry into the approach procedure.*
  - The tracks and bearings, provided on the MCDU F-PLN, PROG... pages are computed TRUE or MAG referenced, according to the TRUE/MAG cockpit selection
    - If selection is TRUE, the bearing and track figures are displayed followed by a T.
  - If the flight crew wishes to create a PBD, PBX waypoint or define a radial (DIR TO INTCPT), the rule for bearing or radial entry is as follows:
    - If the bearing is inserted without specifying its reference, the reference is the one corresponding to the cockpit selection
    - If the bearing is inserted with its specified reference (M for magnetic, T for true), the bearing is so defined: e.g. TOU/350T/15.

EIS PFD/ND

TRUE/MAG REFERENCE INDICATION

The TRUE/MAG reference selection is indicated by a specific label displayed above the heading scales of both EFIS DUs:

- If MAG is selected (which is the most common situation) no label is provided; the bearing to the TO waypoint on the ND is displayed with the digits only
- If TRUE is selected, a TRUE label is provided above PFD/ND heading scales.

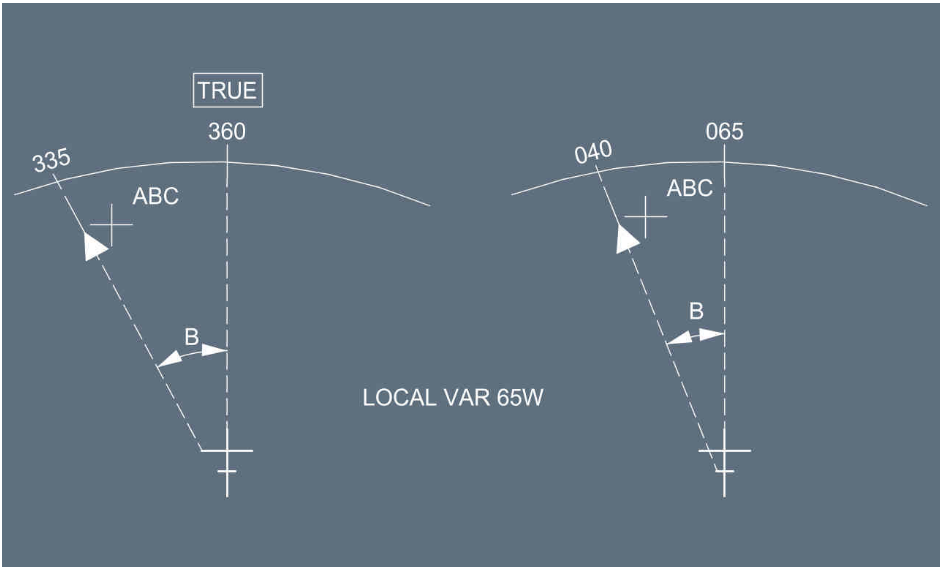
ADF AND VOR BEARING DISPLAY

- The ADF needle represents the relative bearing between the aircraft and the NDB.
  The ADF relative bearing information (B) is thus independant of the TRUE/MAG selection, and the needle is always pointing to the same direction whatever is the selection.
  Furthermore (provided FM position is accurate) when the EFIS ND is in ARC or ROSE NAV modes, the ADF needle will point towards the NDB symbol as provided by the FMS.



Note: The same reading is available on the DDRMI.

- The VOR bearing is measured by the VOR, at the VOR location:
  - It is a TRUE bearing if the VOR station is TRUE referenced
  - It is a MAG bearing if the VOR station is MAG referenced.

  When the ND display mode is ARC or ROSENAV, the FM computed data (aircraft position, F-PLN legs, NAVAID position symbol...) are provided along with VOR needles, if selected.
  → It is important in these display modes, that there is a consistency between the FM data and the VOR raw data.
  Hence, if the cockpit NORTH REF selection does not match the VOR station reference, there may be a discrepancy between the VOR raw data and the FM data, unless a correction is applied to the VOR data.

Principle

When the ND is in ARC/ROSE NAV mode, if there is a mismatch between the NORTH REF selection and the VOR station reference, the VOR needle is equal to the VOR raw bearing corrected by the local variation at the aircraft present position.
In that case, the needle is displayed in magenta colour, the label CORR (corrected) is displayed in magenta in the lower corner of the ND.
In all other ND display modes (ROSE VOR, ROSE ILS), the VOR raw data (with no correction) is displayed. MAG or TRUE (amber) is displayed next to the VOR identifier when its reference does not match the cockpit selection.

EXAMPLE	Local variation 65 W – TL is a magnetic referenced VOR.

Note: ND in ROSE VOR/ROSE ILS modes and DDRMI VOR bearing indications are always identical.

Ident.: DSC-22_20-65-A-00013378.0001001 / 15 FEB 11

DDRMI

The heading provided by the DDRMI is directly linked to the NORTH REF cockpit selection.
The VOR bearing indications are raw data, as provided by the station.

PROCEDURES - FLIGHT

Ident.: DSC-22_20-65-00013430.0001001 / 23 DEC 14
Applicable to: MSN 02887

FLIGHT

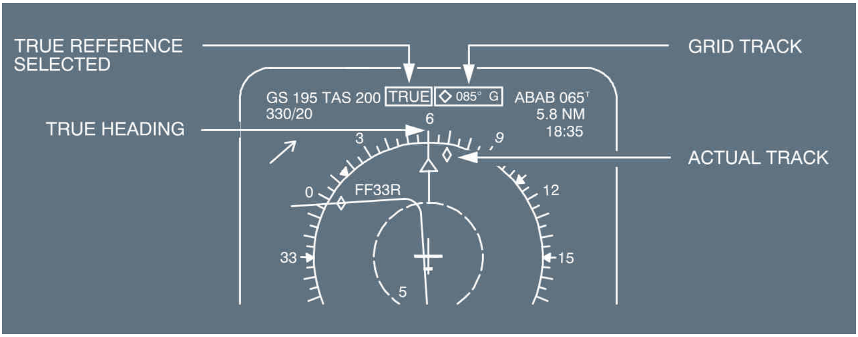
- **Takeoff:**
  - **If the “CHECK NORTH REF” amber message comes up on the ND and MCDU:** Verify that the NORTH REF selection matches the origin airport reference.

  Note: The “CHECK NORTH REF” amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.

- **Cruise:**
  When reaching an area where the heading reference should be changed (oceanic area, airway or polar track defined in TRUE reference ...).

  SELECT TRUE by pressing the NORTH REF pb.

  When reaching 65 N with TRUE reference selected, the GRID TRACK is provided on the ND’s upper right box. The ND compass still displays true track and heading. GRID TRK along with XTK are the cues to be used to monitor the proprer lateral guidance



If the “SELECT TRUE” message appears on the ND/MCDU, this indicates that the aircraft has reached the Polar zone with MAG reference still selected in the cockpit. Press the NORTH REF pb to select TRUE.

USE OF VOR/DME

En route, the VOR/DME are basically used for either FM NAV ACCY crosscheck, or for reporting a given radial to the ATC.
The FM NAV ACCY crosscheck is achieved, as usual, by comparing the bearing/distance that is displayed on the ND, with the bearing/distance that is displayed on the PROG page.
In case the VOR used is defined in another reference (e.g. MAG) than the one selected in the cockpit (e.g. TRUE), the bearing that is provided on ND is in magenta and is corrected. The VOR-corrected bearing should be within 5 ° of the FM-computed bearing (taking into account the meridian convergence and the difference in magnetic variation).
→ In case of doubt, set the NORTH REF to the VOR reference, and check the bearings.

CAUTION	The correction of VOR indications in ROSENAV or ARC ND modes depend on a correct navigation database coding. If the North reference (TRUE/MAG) that is coded for the VOR orientation is not correct, the VOR indication correction will be unduly applied. If VOR needles are in magenta (CORR), check both the aircraft NORTH REF selection and the VOR station orientation on the navigation charts.

If the aircraft has to report on a given VOR radial, which is defined in a different reference (e.g. MAG) from the cockpit reference (e.g. TRUE), check the RADIAL crossing on the PM ND set to ROSE VOR mode, or use DDRMI. (Ex: The aircraft flies NCA 24) : (NCA 24 is the TRUE referenced route). ATC requests the aircraft to report on RADIAL 357 from YZF (MAG-referenced).

177
VOR MAG
YZF

USE OF ADF

The Polar Zone NDBs are quite powerful, and the bearing can be received at long distances.

Use these NDBs to check the reasonableness of the FM navigation by comparing the ADF bearing, that is displayed on the ND, with the FM-computed bearing, that is displayed on the PROG page.

FLYING THE POLE

- In most case, the autopilot will be in NAV mode.

  When approaching the pole, a CHECK HDG message appears, with the associated ECAM Procedure.
  - Disregard the ECAM Procedure.
    The message is due to the fact that the IRSs do not reach the pole simultaneously; thus the headings do not turn simultaneously from 360 to180 °.
- If the flight crew uses the HDG mode
  - The autopilot onside that the best IRS is to be engaged.
    The offside HDG bug (q) should be disregarded when close to the pole since, the headings may differ.

APPROACH

- If CHECK NORTH REF amber message comes up on ND and MCDU, verify that the NORTH pushbutton is selected to the destination airport reference.

  Note: *The “CHECK NORTH REF” amber message and the associated alerts are dependant of a correct coding of the airport North reference (TRUE/MAG) in the navigation database. The runway orientation displayed on ND is also affected if the airport North reference is not correctly coded.*

- If TRUE is selected for approach, only CAT I ILS approaches may be flown.

FLIGHT PLAN INITIALIZATION THROUGH ACARS

Ident.: DSC-22_20-70-00000956.0007001 / 17 MAY 21

1 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

REQUEST FOR ACTIVE FLIGHT PLAN INITIALIZATION BEFORE ENGINE START

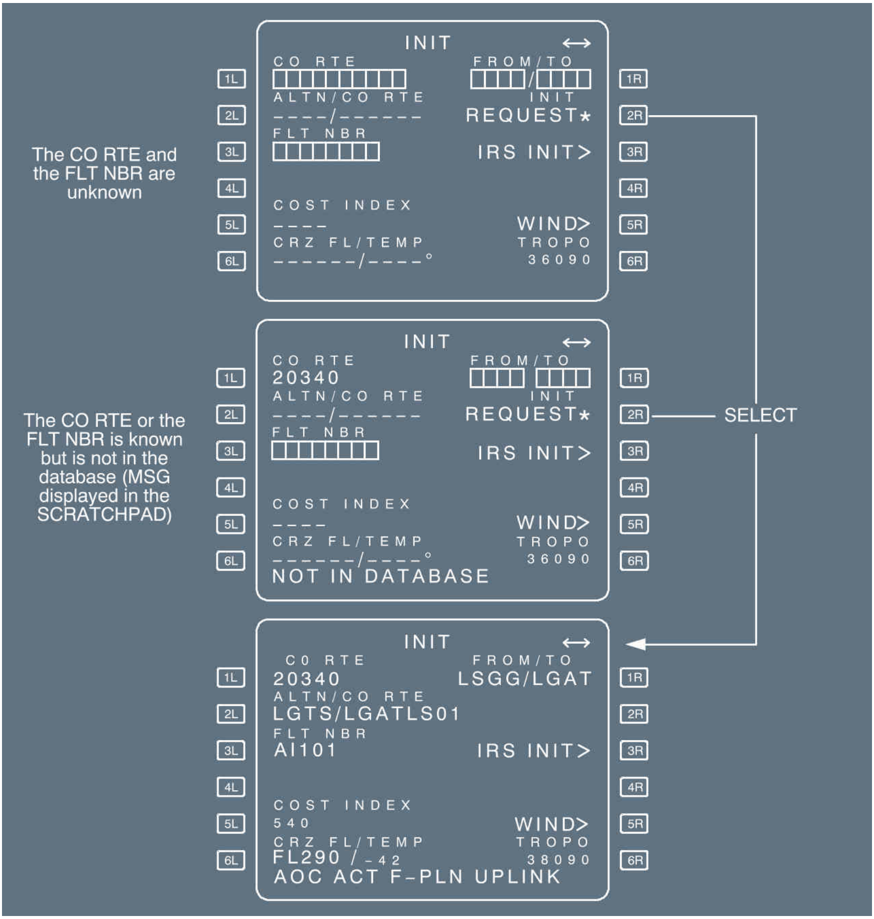
Before engine start, the crew may request a route for the active flight plan. When the route is received, “AOC ACT F-PLN UPLINK” message is displayed on the MCDU indicating that the flight plan has been received and automatically inserted.
After engine start, it is not possible to initialize directly the active flight plan since the received flight plan is automatically routed into the secondary, and the MDCU displays “AOC SEC F-PLN UPLINK”.

PROCEDURE

PRESS the INIT REQUEST * prompt.

The star (*) disappears, all data fields are dashed except:
- *CO RTE, FLT NBR if previously displayed and*
- *Default values.*

The star is not displayed when the FMGS cannot communicate with the ACARS. No request can be sent.
When an active flight plan exists, INIT REQUEST prompt is removed from the active INIT page and no request can be sent for the active flight plan. If a flight plan is entered manually after the request, the uplink message is routed to the secondary.



The CO RTE and the FLT NBR are unknown

REQUEST FOR SECONDARY FLIGHT PLAN

A request for a secondary flight plan can be initiated anytime. Any flight plan received after engine start is automatically routed into the secondary flight plan.
When the flight plan is received, a message “AOC SEC F-PLN UPLINK” is displayed on the MCDU scratchpad.
Before engine start, and if the SEC F-PLN is empty, any uplinked flight plan is automatically inserted into the secondary flight plan, and no flight crew action is required.

After engine start, or if the SEC F-PLN is not empty, the flight crew must manually insert the uplinked flight plan via INSERT UPLINK prompt.

PROCEDURE TO INSERT OR REJECT A SECONDARY FLIGHT PLAN

When the uplink message is received, the INIT REQUEST prompt of the INIT A page is replaced by INSERT UPLINK (2R field). Pressing the 2R key will insert the flight plan into the secondary. Clearing the prompt will reject it.
If a temporary flight plan or a DIR TO is in progress, the uplink insertion is not accepted until the temporary flight plan or the DIR TO is completed.

This displays the uplink data on 2 different pages: UPLINK MAX TO DATA
UPLINK FLX TO DATA

SELECT the data corresponding to the thrust to be used (MAX or FLEX) by pressing [4R].

SELECT the active runway data by slewing the pages (1/4... 4/4).
PRESS the [6R] key “INSERT UPLINK”.

UPLINK MAX TO DATA and UPLINK FLX TO DATA pages are not modifiable.

Note: *The “INSERT UPLINK” prompt is not displayed:*
- *If the uplinked runway is different from the active runway*
- *If the uplinked TOW differs from the FMS-estimated TOW by more than 1 t*
- *If the uplinked TOCG differs from the FMS-estimated TOCG by more than 0.5 %*
- *If the uplink is incomplete.*

- **When the takeoff data have been inserted**

, the PERF TO page is amended of the new data.

REQUEST FOR WIND DATA

To send a wind request, press the “WIND REQUEST” selection key of any wind pages. This request is automatically sent to the ground for one or more flight phases and for the selected flight plan (primary or secondary). The content of the wind request message is not dependent on the selected wind page (CLIMB, CRUISE or DESCENT) but on the flight phase in progress.

- For active flight plan or secondary flight plan that is a “COPY ACTIVE”, a wind request sent by the crew:
  - during preflight or takeoff phase, initiates a demand for climb, cruise, descent and alternate winds.
  - during climb and cruise phase, initiates a demand for cruise, descent and alternate winds.
  - during descent/approach and go around, no wind request is possible.
- For secondary flight plan that is not a “COPY ACTIVE” there is no restriction linked to flight phase.

Before engine start, and if data has not been entered in any WIND page for the flight plan, the uplinked wind data is automatically inserted into the flight plan, and no flight crew action is required.

If the uplinked wind message is received after engine start, or if data has been entered in any WIND page of the flight plan, the flight crew must manually insert the uplinked wind data via the INSERT UPLINK prompt.

PROCEDURE TO INSERT WIND DATA

When the uplink message is received, the [2R] field is modified, the WIND/TEMP REQUEST is replaced by the INSERT UPLINK. This prompt, when pressed, enables the flight crew to insert the uplink wind data, phase by phase.
To access, review, insert or delete the uplink wind data of other phases, the flight crew uses "NEXT PHASE" or "PREV PHASE" key.
If the flight crew is not satisfied with the uplink winds, the flight crew will delete the winds, phase by phase clearing the "INSERT UPLINK" prompt. This will delete all the uplinked winds of the selected flight phase.

PROCEDURE TO INSERT WIND DATA

When the uplink message is received, “WIND REQUEST” disappears from the 3R field and “UPLINK” is displayed in large yellow font next to the title.
To access, review, insert or delete the uplink wind data of other phases, the flight crew uses “NEXT PHASE” or “PREV PHASE” key.
If the flight crew is not satisfied with the uplink winds, the flight crew can delete them using the "UPLINK CANCEL" prompt (6L field). This will delete all unplinked winds

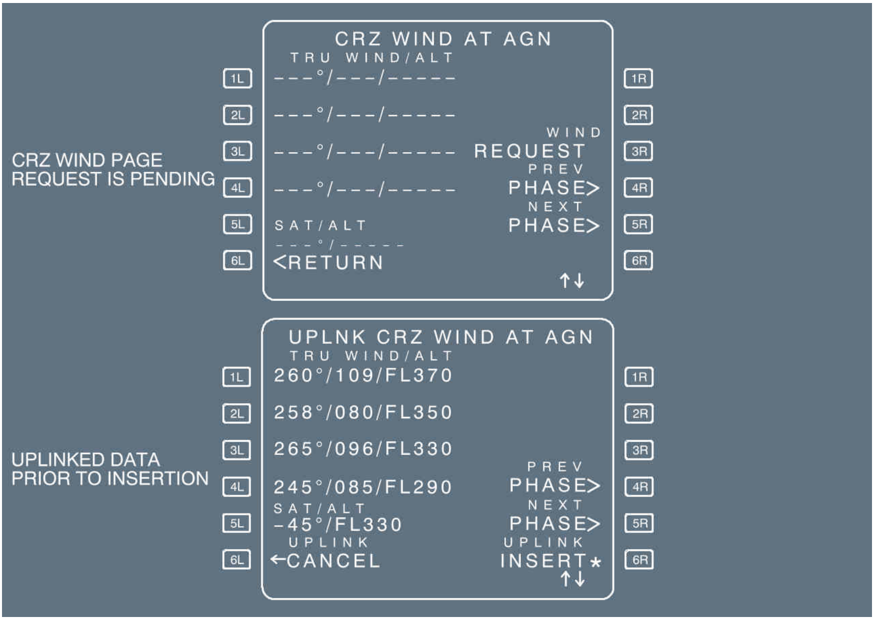
NEW WINDS ARE INSERTED

CLIMB WIND PAGE

When a request is pending, the history WIND page cannot be accessed.
When the climb phase is active, the flight crew cannot request neither modify the climb winds of the active flight plan or secondary flight plan if it is a copy active.

CRUISE WIND PAGE



CRZ WIND PAGE REQUEST IS PENDING

```

                          ↑↓
```

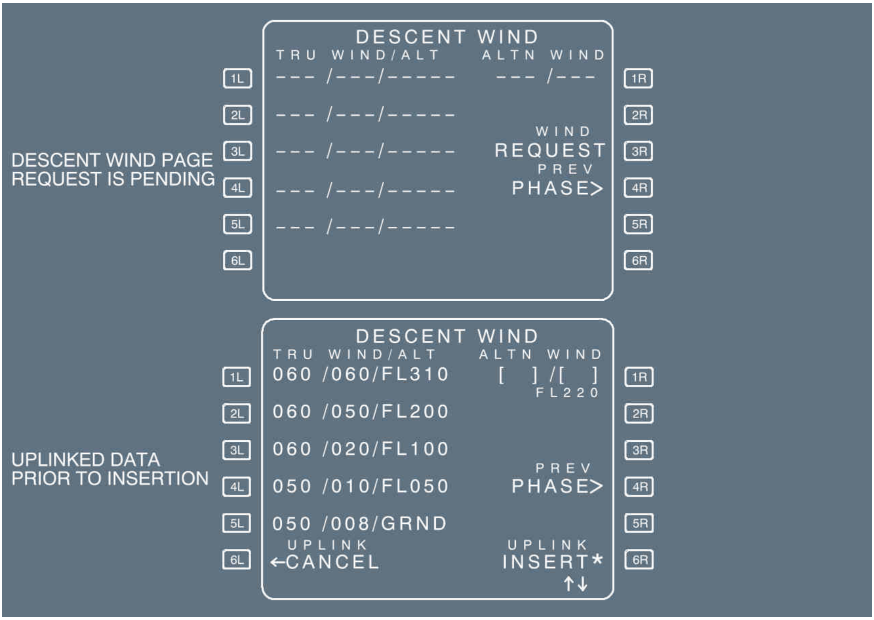
A wind request sent during cruise phase will apply for downpath waypoints of the cruise, descent, approach and alternate phases.

- If the uplink message contains more data and waypoints than the flight plan, the winds at extra waypoints are not considered and automatically discarded. This is transparent to the flight crew
- Clearing the INSERT UPLINK* prompt deletes all uplink wind data of the cruise phase. Cruise page reverts to the previous data.

DESCENT WIND PAGE

The procedures to insert, review or delete descent winds during preflight, climb or cruise phase are described in the above wind general procedure.



DESCENT WIND PAGE REQUEST IS PENDING

```

                          ↑↓
```

If the alternate wind is not available, dashes are displayed in the field.
In descent, approach or go around phases, the flight crew cannot request or modify the descent winds of the active flight plan or secondary flight plan if it is a “COPY ACTIVE”.

PRINT FUNCTION

Ident.: DSC-22_20-80-00000964.0011001 / 18 MAR 11
Applicable to: MSN 04827-04860

The PRINT function allows various reports to be printed either automatically (when linked to ACARS ◁ or ATSU ◁) or manually.

The manual PRINT function allows printing of FM-generated flight reports and additional data:

F-PLN	INITialization data
T.O.	Data
WIND	Data
PREFLIGHT	REPORT
IN FLIGHT	REPORT
POSTFLIGHT	REPORT

A detailed description of the PRINT FUNCTION pages is provided in *Refer to DSC-22_20-50-10-28 PRINT FUNCTION Pages*.
The print function is available if ACARS ◁ or ATSU ◁ are available or not.
The various flight reports contain most of the prediction information required by the flight crew to monitor the progress of the flight. The resulting documents can therefore be used as realistic master documents, based on the latest data provided by the flight crew to the computer, in terms of ATC clearances and weather information.

PRINT FUNCTION

ON GROUND BEFORE ENGINE START

Ident.: DSC-22_20-80-00000966.0001001 / 23 JUN 15
3 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

When the overall F-PLN data (lateral, vertical including winds, steps, constraints) and the ZFW and ZFWCG values have been inserted:

SELECT the FUEL PLANNING prompt [3R],

- **If the computed BLOCK fuel does not correspond to the actual block fuel required for the flight:**

  ENTER the actual block required for the flight in the [2R] field,

  PRINT the PREFLIGHT report.

  The flight crew may then use the PREFLIGHT report to monitor the progress of the flight.

  Note: *Before printing the PREFLIGHT report, the flight crew must check that the F-PLNis complete (all F-PLN discontinuities must be cleared) and that all the F-PLN elements (including winds, steps, constraints, alternate airport) have been inserted, in order to obtain an accurate PREFLIGHT report.*

ON GROUND BEFORE ENGINE START

Ident.: DSC-22_20-80-00000966.0008001 / 18 MAR 11
Applicable to: MSN 04827-04860

When the overall F-PLN data (lateral, vertical including winds, steps, constraints) and the ZFW and ZFWCG values have been inserted:

SELECT the FUEL PLANNING prompt [3R],

- **If the computed BLOCK fuel does not correspond to the actual block fuel required for the flight :**

  ENTER the actual block required for the flight in the [2R] field,

PRINT the PREFLIGHT report.

The flight crew may then use the PREFLIGHT report to monitor the progress of the flight.

Note:
1. *Before printing the PREFLIGHT report, the flight crew must check that the F-PLN is complete (all F-PLN discontinuities must be cleared) and that all the F-PLN elements (including winds, steps, constraints, alternate airport) have been inserted, in order to obtain an accurate PREFLIGHT report.*
2. *The following anomalies are known on Thales/Smiths FMS PREFLIGHT reports:*
   - *Head trip wind values are always printed as 000 ° and Tail trip wind values as 180 °.*
   - *The name of PLANA waypoint may erroneously be replaced with “SAURA”.*

IN FLIGHT

Ident.: DSC-22_20-80-00000968.0012001 / 18 MAR 11
Applicable to: MSN 04827-04860

Once the aircraft has reached the CRZ FL once, all the latest ATC clearances have been inserted in the FM, when all the WINDS/STEPS have been properly updated:

ACCESS the PRINT FUNCTION page
PRINT the INFLIGHT REPORT

The inflight report provides the list of all the overflown F-PLN waypoints (HISTORY VALUES) with their associated data (Time, ALT, Fuel, ...), and the predictions to all the downpath waypoints (PREDICTED VALUES).
This new document replaces the PREFLIGHT report, since it carries all the latest expected F-PLN changes. It is the new applicable master document used to monitor the progress of the flight.
The inflight report will be printed after each important F-PLN modification.

Note: *The following anomalies are known on Thales/Smiths FMS IN FLIGHT reports:*
- *Winds not yet inserted with the UPDATE INSERT prompt are erroneously printed on the INFLIGHT print as if they had been inserted.*
- *The distance on the last sequenced waypoint is erroneous.*
- *Head trip wind values are always printed as 000 ° and Tail trip wind values as 180 °.*
- *The TO waypoint of a DIR TO with ABEAM is not printed.*
- *The name of PLANA waypoint may erroneously be replaced with “SAURA”.*

IN FLIGHT

REACHING THE GATE AFTER LANDING

Ident.: DSC-22_20-80-00000970.0012001 / 18 MAR 11
Applicable to: MSN 04827-04860

The POSTFLIGHT REPORT gives a complete list of all the overflown waypoints during the flight (HISTORY VALUES).

Furthermore it provides:
- FUEL/TIME summary
- IRS Drift and G/S

Once at the gate, after engine shutdown:
- ACCESS the PRINT FUNCTION page
- PRINT the POSTFLIGHT REPORT

Note: *The following anomalies are known on Thales/Smiths FMS POST FLIGHT reports:*
- *The IRS Drift value on the POST FLIGHT REPORT may be erroneous.*
- *Some ABEAM waypoints may not be printed on the POST FLIGHT REPORT.*
- *Head trip wind values are always printed as 000 ° and Tail trip wind values as 180 °.*
- *The name of PLANA waypoint may erroneously be replaced with “SAURA”.*

HOW TO CHANGE T.O DATA OR DEPARTURE RUNWAY AFTER REJECTED TAKEOFF

Ident.: DSC-22_20-85-00023074.0001001 / 04 NOV 20
Applicable to: ALL

GENERAL

This chapter provides an operational recommendation to the flight crew, on how to modify the FMS T.O DATA or departure runway after a rejected takeoff.

DESCRIPTION

In case of rejected takeoff (with an aircraft speed above 90 kt or with sufficient thrust), the FMS remains in TAKEOFF phase and the flight crew cannot modify the FMS departure T.O DATA or departure runway in the active flight plan.

OPERATIONAL RECOMMENDATION

In that case, if the flight crew has to change the FMS T.O DATA in the active flight plan, the flight crew should proceed as follows:

- Delete the SEC F-PLN
- Initialize the SEC F-PLN with the new T.O DATA and/or new departure runway
- Activate the SEC F-PLN.

INSERTION OF APPROACH MINIMA

AUTOMATIC FMGC RESET AND RESYNCHRONIZATION

Ident.: DSC-22_20-90-10-A-00012661.0001001 / 04 NOV 20
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

FM RESET

When the FM software cannot work properly or receives instructions to perform impossible operations, it automatically resets itself. A resynchronization with the other FM always follows. When the reset is a minor one, the system will recover by itself. One single reset lasts 2 to 3 s maximum followed by 25 s of resynchronization.

When the reset is a major one:
- Resets recur at short intervals (several in 2 or 3 min)
- The memories are cleared, leading to the loss of F-PLN, GW, CI, CRZ FL, MCDU-entered speeds and NAVAIDs and to database switching.

CAUTION	If three dual FM resets occur in 2 min, pilot-entered data is lost. If a dual reset is identified, it is recommended that the flight crew does not perform again the last MCDU actions for 1 min (in order to avoid a potential second dual reset, leading to the loss of pilot-entered data).

Ident.: DSC-22_20-90-10-A-00012661.0003001 / 04 NOV 20
Applicable to: MSN 04827-04860

- The memories are cleared, leading to the loss of F-PLN, GW, CI, CRZ FL, MCDU-entered speeds and NAVAIDs.

CAUTION	If four dual FM resets occur in 3 min, pilot-entered data is lost. If a dual reset is identified, it is recommended that the flight crew does not perform again the last MCDU actions for 1 min (in order to avoid a potential second dual reset, leading to the loss of pilot-entered data).

FM RESYNCHRONIZATION

An FM resynchronization automatically occurs after an FM reset but it may occur independently each time self comparisons between FM1 and FM2 reveal discrepancies.
One single resynchronization lasts approximately 25 s.
If 5 several resynchronizations occur within 5 min, independent mode commences.

Ident.: DSC-22_20-90-10-A-00012662.0002001 / 19 AUG 10

Applicable to: MSN 04827-04860

FM RESYNCHRONIZATION

An FM resynchronization automatically occurs after an FM reset. But, it may occur independently each time self-comparisons between the FM1 and FM2 reveal discrepancies.
If three successive resynchronizations fail, independent mode commences.

FMGC STATUS DURING A RESET/RESYNCHRONIZATION

While a RESET/RESYNCH occurs:
- The ND shows “MAP NOT AVAIL”
- The MCDU reverts to the A/C STATUS page, with “PLEASE WAIT” displayed in the scratchpad
- Autotuning of Navaids (VOR, DME, ADF) are lost on the failed side
- AP and managed modes may be transiently lost (reversion to HDG/V/S or TRK/FPA)
- If the pilot presses a key while the scratchpad is showing “PLEASE WAIT”, there is no change at MCDU level. This is normal, and the crew should not respond by pulling the MCDU circuit breaker.

FMGC STATUS DURING A RESET/RESYNCHRONIZATION

While a RESET/RESYNCH occurs:

- The ND shows “MAP NOT AVAIL”
- The MCDU may revert to the MCDU MENU page
- Autotuning of Navaids (VOR, DME, ADF) are lost on the failed side
- AP/FD /A/THR modes may be transiently lost
- A reversion to basic modes (HDG/V/S or TRK/FPA) occurs if the FM1 (FM2) resets while AP1 (AP2) is engaged.

SINGLE RESET OR DUAL RESET WITH AUTORECOVERY

If the RESET/RESYNCH succeeds, all functions are recovered.

Note: *When an FMGC is recovered, its FD if previously engaged, is also recovered and its status is displayed on the FMA.*

PROCEDURE

RESELECT the convenient MCDU page.
REENGAGE managed modes and the AP.

WAIT 1 min after the "PLEASE-WAIT" message has disappeared, before engaging the AP/FD of the failed FMGC.

If "MAP NOT AVAIL" remains displayed, along with "SET OFFSIDE RNG/MODE" on one ND, temporarily SELECT a different mode on the corresponding EIS control panel.

Ident.: DSC-22_20-90-10-A-00012664.0002001 / 10 JAN 11
4 **Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

SINGLE RESET OR DUAL RESET WITH AUTORECOVERY

If the RESET/RESYNCH succeeds, all functions are recovered.

Note: *When an FMGC is recovered, its FD if previously engaged, is also recovered and its status is displayed on the FMA.*

PROCEDURE

RESELECT the convenient MCDU page.
REENGAGE managed modes and the AP.

WAIT 1 min after the "PLEASE-WAIT" message has disappeared, before engaging the AP/FD of the failed FMGC.

If both "MAP NOT AVAIL" and "SET OFFSIDE RNG/MODE" remain displayed on one ND, or if "OFFSIDE FM CONTROL" remains displayed, temporarily SELECT a different mode or range on the corresponding EIS control panel.

Ident.: DSC-22_20-90-10-A-00012664.0019001 / 10 JAN 11
Applicable to: MSN 04827-04860

SINGLE RESET OR DUAL RESET WITH AUTORECOVERY

If the RESET/RESYNCH succeeds, all functions are recovered.

Note: *When an FMGC is recovered, its FD if previously engaged, is also recovered and its status is displayed on the FMA.*

PROCEDURE

RESELECT the convenient MCDU page.
REENGAGE managed modes, and the AP and A/THR, if necessary.

If both “MAP NOT AVAIL” and “SET OFFSIDE RNG/MODE” remain displayed on one ND, or if “OFFSIDE FM CONTROL” remains displayed, temporarily SELECT a different mode or range on the corresponding EIS control panel.

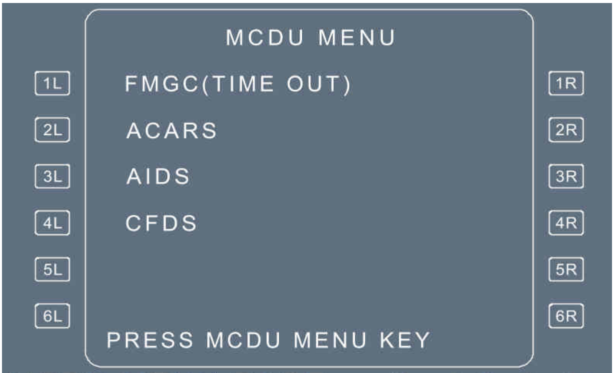
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

SINGLE LATCH

If five successive resets occur, the failing FMGC will latch, and single mode operation will start.

While failed, the following occurs:
- The failed ND side displays “MAP NOT AVAIL” and “SELECT OFFSIDE RNG/MODE” (if the NDs are not both in the same mode or range)
- The MCDU reverts to the MENU PAGE and shows an “FMGC TIME OUT” prompt
- If the AP and FD were previously engaged on the failed side, the AP and FD disengage and the right-hand column of the FMA shows that the operating FD is offside. The ECAM displays the “AP OFF” warning, and the master warning light and audio remind the pilot of the AP disengagement
- All functions are restored on the operative side.



MCDU MENU PAGE on the failed side

PROCEDURE

Select the same range and mode on both NDs to give the failed ND side something to display. Select any function key on the affected FMGC MCDU. (The page will display “OPP FMGC IN PROGRESS”).

Both MCDUs are now driven by the other FMGC, and only one AP/FD is available. The system works in SINGLE Mode.

Perform a manual reset of the failed FMGC, when convenient.

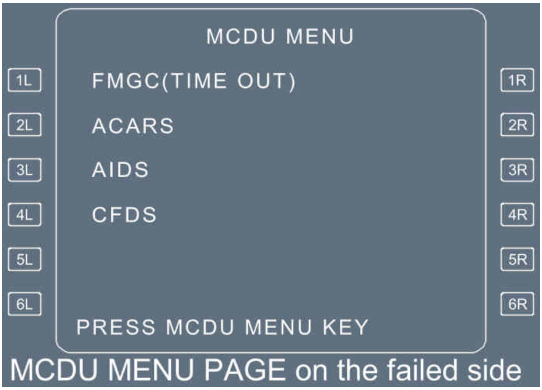
5 **Applicable to: MSN 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

SINGLE LATCH

If five successive resets occur, the failing FMGC will latch, and single mode operation will start.

While failed, the following occurs:
- On the ND usually associated with the failed FMGC:
  If the NDs are not both in the same mode or range, the associated ND displays “MAP NOT AVAIL” and “SET OFFSIDE RNG/MODE”. If the NDs are in the same mode and range, the associated ND displays the “OFFSIDE FM CONTROL” amber message
- The MCDU reverts to the MENU PAGE and shows an “FMGC TIME OUT” prompt
- If the AP and FD were previously engaged on the failed side, the AP and FD disengage and the right-hand column of the FMA shows that the operating FD is offside. The ECAM displays the “AP OFF” warning, and the master warning light and audio remind the pilot of the AP disengagement.
- All functions are restored on the operative side.



MCDU MENU PAGE on the failed side

PROCEDURE

Select the same range and mode on both NDs to give the failed ND side something to display. Select any function key on the affected FMGC MCDU. (The page will display “OPP FMGC IN PROGRESS”).

Both MCDUs are now driven by the other FMGC, and only one AP/FD is available. The system works in SINGLE Mode.

Perform a manual reset of the failed FMGC, when convenient.

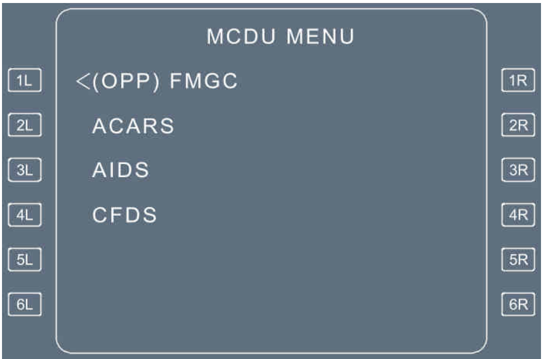
Ident.: DSC-22_20-90-10-A-00012665.0033001 / 10 JAN 11
Applicable to: MSN 04827-04860

SINGLE LATCH

If five successive resets occur in 4 min, the failing FMGC will latch, and single mode operation will start.

While failed, the following occurs:

- On the ND usually associated with the failed FMGC:
  If the NDs are not both in the same mode or range, the associated ND displays “MAP NOT AVAIL” and “SET OFFSIDE RNG/MODE”. If the NDs are in the same mode and range, the associated ND displays the “OFFSIDE FM CONTROL” amber message
- The MCDU reverts to the MENU PAGE and shows an “(OPP) FMGC” prompt
- If the AP and FD were previously engaged on the failed side, the AP and FD disengage and the right-hand column of the FMA shows that the operating FD is offside. The ECAM displays the “AP OFF” warning, and the master warning light and audio remind the pilot of the AP disengagement
- All functions are restored on the operative side.



MCDU MENU PAGE on the failed side

PROCEDURE

Select the same range and mode on both NDs to give the failed ND side something to display. Select any function key on the affected FMGC MCDU. (The page will display “OPP FMGC IN PROCESS”).

Both MCDUs are now driven by the other FMGC, and only one AP/FD is available. The system works in SINGLE Mode.

Perform a manual reset of the failed FMGC, when convenient.

Applicable to: MSN 04827-04860

SINGLE LATCH WITH AP AND FD STILL AVAILABLE IN MANAGED MODES ON BOTH SIDES

In some cases, one FMS may fail and latch (no auto-recovery), but the FMS may continue to send valid but frozen guidance targets to the FG. These frozen guidance targets correspond to the last valid targets sent by the FMS before the failure.
In that case, the FG does not see the FMS failure.
Both AP and FD may remain available. If the AP is engaged on the affected side, the failed FMGC continues to guide the aircraft in managed mode (speed, vertical and lateral) with the frozen targets.
When the FMGC fails, the cockpit effects are as follows:

PFD

- There is no change on the FMA:
  - No mode reversion, no automatic AP disconnection, and no automatic A/THR disconnection
  - "1FD2" may remain displayed on both FMA
- The FD orders are erroneous on the side of the failed FMGC, since based on the frozen guidance targets
- The FD orders are still available and correct on the opposite side.

ND

The flight crew may encounter one of the following two situations:

- Situation 1: The ND associated to the failed FMGC displays "MAP NOT AVAIL" in red, and "GPS PRIMARY LOST" in amber
- Situation 2: The ND associated to the failed FMGC displays either:
  - The map coming from the opposite FMS and "OFFSIDE FM CONTROL" in amber, if both NDs are in the same range and mode, or
  - "MAP NOT AVAIL" in red and "SET OFFSIDE RNG/MODE" in amber, if both NDs are not in the same range and mode.

MCDU

- The MCDU of the failed FMGC is frozen
- The other MCDU displays "INDEPENDENT OPERATION" in amber.

ECAM

- The FWS may trigger the ECAM alert "CAB PR LDG ELEV FAULT".

PROCEDURE

DISREGARD the information coming from the failed side

DO NOT USE the AP on the affected side

- **If the AP is engaged on the affected side:**

  FLY the aircraft back on the intended path

  ENGAGE the AP on the operative side, according to the Recommended Practice for Autopilot Engagement (*Refer to FCTM/AS-FG-10-1 Recommended Practice for Autopilot (AP) Engagement*)

- **If time permits:**

  PERFORM a long reset of the failed FMGC

- **If the failure affects FMGC1, and if the FMGC1 is still failed and latched before the approach:**

  DO NOT USE AP1 for the approach

  - **Before disconnecting AP2:**

    REVERT to selected speed

    DISCONNECT A/THR

    Note: *It prevents the A/THR from switching to the frozen speed target of the failed FMGC1 when the flight crew disconnects the AP2 for landing.*

Ident.: DSC-22_20-90-10-A-00012666.0001001 / 03 NOV 22

DUAL RESET WITH LOSS OF DATA AND AUTORECOVERY

Three successive dual resets without result erases all flight crew-entered data (F-PLN, GW, CRZ FL, CI, etc.).

When FMGS recovery is obtained:
- Database cycle may have switched
- The FM position bias is lost. The FM position returns to the MIX IRS position.
- Autotuning the VOR/DME is restored, based on the aircraft’s IRS position
- FMGS tuning of the ILS and ADF is not possible
- Lateral and vertical managed mode cannot reengage
- The CAB PR LDG ELEV FAULT alert is triggered
- A map display may be lost on one ND.

PROCEDURE

When the system recovers:
If the FMGC remains in Takeoff phase, CHANGE the vertical mode in order to recover the next flight phase.

SELECT the initial database.

SELECT DIR TO the required downpath waypoint.
SELECT LAT REV at the downpath waypoint, and redefine the DESTINATION.
SELECT the FUEL PRED page, and enter GW.
SELECT the PROG page, and enter CRZ FL.
SELECT the PERF page, and enter CI.
CHECK or reengage (as appropriate) the relevant speed/Mach target and vertical mode.

L2 *Redefine the flight plan for the remainder of the flight.*

L1 If MAP NOT AVAIL remains displayed, along with SET OFFSIDE RNG/MODE on one ND, temporarily SELECT a different mode on the corresponding EFIS control panel.
PERFORM a NAV accuracy check, when possible.

L2 *The flight crew should consider a manual FM position update, if MIX IRS and actual positions differ by more than 20 NM.*

FMS DEGRADED MODE

In some remote cases (several automatic resets in a row on one or both FMS), the affected FMS(s) may enter a “degraded mode”, with no predictions.
The intent of this degraded mode is to keep maximum use of the FMS and related functions.

The characteristics of this FMS degraded mode are the following:
- The predictions are lost on the affected FMS(s). All predictions are replaced by dashes on MCDU pages
- The vertical profile and managed speed computations are lost on the affected FM(s) (in Approach phase, VAPP is correctly computed and managed speed is available)
- Managed vertical guidance and managed speed (if previously used) are lost and revert to selected mode
- Lateral path computation and guidance remain available
- The MCDU displays the “FM PREDICTIONS LOST” message.

Note: *1. If predictions are lost on one FMS only, all managed modes are available when using the other side AP.*
2. The Approach phase must be activated manually.

PROCEDURE

● **If the message “FM PREDICTIONS LOST” is displayed:**

- If vertical managed guidance and/or prediction are not deemed necessary, keep using the FMS as needed for Lateral navigation only. Use selected modes for vertical and speed guidance.

  Note: *If only one FMS has entered the degraded mode, consider using the other AP.*

- If vertical managed guidance and/or predictions are required, RE-ENTER a Cost Index (CI) value on INIT A or PERF page (predictions for the active flight plan are then recomputed).

  Note: *In approach phase, a direct CI entry is not allowed : it is then not possible to recover predictions. However, entry of the current altitude in the CRZ FL field will force the CRZ phase and thus, allow to reenter the CI. The approach phase may then be re-activated again.*

Ident.: DSC-22_20-90-10-A-00012668.0001001 / 17 MAR 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03662

DUAL LATCH

- Both FMGCs are inoperative. FM and FG capability are lost
- Both NDs display "MAP NOT AVAILABLE". NAVAID tuning is not performed
- AP/FD, A/THR are lost
- FMGC (TIME OUT) subsystem page is displayed on both MCDUs
- The following messages are displayed on the ECAM:
  "CAB PR LDG ELEV FAULT"
  "AUTO FLT AP OFF", if AP was engaged
  "AUTO FLT A/THR OFF", if A/THR was engaged.

PROCEDURE

FLY raw data.
TUNE necessary NAVAIDs using the RMPs.
PERFORM a manual reset of both FMGCs.

Note: *A recovery will result in the loss of all pilot-entered data.*

Note for all FMGC automatic resets

- A single or double FM auto-reset does not affect an ILS approach below 700 ft AGL. ILS frequency is locked and AP/FDs remain engaged
- Above 700 ft , the loss of ILS tuning due to a dual reset will cause a loss of LOC and G/S, and the disengagement of APs and FDs
- During a non ILS approach, if the master FMGC fails, AP/FD and managed modes are lost and FDs engage in basic modes.

Ident.: DSC-22_20-90-10-A-00012668.0013001 / 17 MAR 17
7 **Applicable to: MSN 03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

DUAL LATCH

- Both FMGCs are inoperative. FM and FG capability are lost
- Both NDs display "MAP NOT AVAILABLE". NAVAID tuning is not performed
- AP/FD, A/THR are lost
- FMGC (TIME OUT) subsystem page is displayed on both MCDUs
- The following messages are displayed on the ECAM:
  "CAB PR LDG ELEV FAULT"
  "AUTO FLT AP OFF", if AP was engaged
  "AUTO FLT A/THR OFF", if A/THR was engaged.

PROCEDURE

FLY raw data.

TUNE necessary NAVAIDs using the RMPs.
PERFORM a manual reset of both FMGCs.

- **If successful, refer to dual reset with loss of data and auto recovery:**

  Note: A recovery will result in the loss of all pilot-entered data.

- **If unsuccessful:**

  FLY raw data.

  Select the NAV B/UP prompt on both MCDU DATA pages.

  (Refer to DSC-22_20-60-130 General HOW TO USE, concerning navigation backup operation).

  SET the landing elevation of the destination on the overhead panel.

Note for all FMGC automatic resets

- A single or double FM auto-reset does not affect an ILS approach below 700 ft AGL. ILS frequency is locked and AP/FDs remain engaged
- Above 700 ft , the loss of ILS tuning due to a dual reset will cause a loss of LOC and G/S, and the disengagement of APs and FDs
- During a non ILS approach, if the master FMGC fails, AP/FD and managed modes are lost and FDs engage in basic modes.

MANUAL FMGC RESET

Ident.: DSC-22_20-90-10-B-00012669.0001001 / 10 JAN 11
8 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

On rare occasions, the FMGC may require manual resetting.
If this occurs in flight, reset one FMGC at a time.

Ident.: DSC-22_20-90-10-B-00012669.0002001 / 01 APR 14
Applicable to: MSN 04827-04860

On rare occasions, the FMGC may require manual resetting.
If this occurs in flight, reset one FMGC at a time.

The flight crew can perform two types of FMGC reset:
- A short FMGC reset of 10 s
  The FMS re-initializes data processing. However the data entered by the flight crew are memorized (F-PLN, INIT and PERF data)
- A long FMGC reset of 15 min
  All the memory is cleared and the FMS re-initializes all data and processing.

Ident.: DSC-22_20-90-10-B-00020857.0001001 / 17 MAR 17
Applicable to: ALL

Refer to System Reset Table - AUTO FLT
for the manual reset procedure of the FMGC.

Ident.: DSC-22_20-90-10-B-00012671.0001001 / 17 MAR 17
Applicable to: ALL

MANUAL RESET OF BOTH FMGC

When the aircraft is on ground with the engines stopped, the flight crew may attempt a double and simultaneous CB reset when a single CB reset has failed.

"CHECK WEIGHT" MESSAGE

Ident.: DSC-22_20-90-20-00012677.0001001 / 04 JUN 19
Applicable to: ALL

DESCRIPTION

The “CHECK WEIGHT” message appears on the MCDU when the Gross Weight (GW) computed by the FMGC and the GW computed by the FAC disagree by more than 7 t (15 432 lb).

PROCEDURE

When this message appears:

FMS FOB .... CHECK

CALL UP the MCDU FUEL PRED page and compare the FOB to the FOB from the Computerized F-PLN. Correct it if necessary.

FMS ZFW value.. CHECK

CALL UP the MCDU FUEL PRED page and compare the ZFW to the ZFW on the loadsheet.

- **If the FMS ZFW on the MCDU is not correct**

  FMS ZFW .... CORRECT/RE-INSERT

  The entry of a correct ZFW will clear the MCDU message.

- **If the FMS ZFW on the MCDU is correct**

  VLS, F, S, GREEN DOT (PFD).. DISREGARD

  If the FMS GW is correct, the characteristic speeds computed by the FAC (displayed on PFD) may not be correct.

  QRH OPERATING SPEEDS.. USE

  Refer to QRH/OPS Operating Speeds

Intentionally left blank

ERRONEOUS PREDICTIONS

Ident.: DSC-22_20-90-30-00012672.0001001 / 28 MAY 20
Applicable to: ALL

DESCRIPTION

The FMGS may display temporary erroneous predictions that can affect such data as ECON speed/Mach, optimum flight level, fuel or time predictions.

OPERATIONAL RECOMMENDATION

The flight crew should not perform a reset of the FMS.

FOR MISSING PREDICTIONS OR OBVIOUS ERRONEOUS PREDICTIONS

To recover the FMS predictions:

1. On the WIND page, the flight crew should verify for each flight level:
   - The temperature value for each cruise waypoint
   - The wind data for each cruise waypoint.

   If some temperature or wind data are erroneous or missing the flight crew should:
   - Update data
   - Check if correct predictions are recovered.
2. In the legs of the Flight Plan, the flight crew should verify:
   - If there is one Flight Plan leg with erroneous predicted distance, or erroneous predicted time or erroneous predicted fuel consumption, and
   - If one Flight Plan leg with erroneous predictions exists, then the flight crew should:
     - Insert an intermediate waypoint
     - Check if correct predictions are recovered.

3. In the arrival procedure of the Flight Plan, the flight crew should verify:
   - If there are two successive waypoints separated by a distance of 3 NM or less, and
   - If one of these two waypoints contains an AT OR BELOW altitude constraint the flight crew should:
     - Insert the same altitude constraint to the lowest waypoint
     - Check if correct predictions are recovered.

FOR SUSPECTED ERRONEOUS PREDICTIONS OR TO FORCE A F-PLN RE-COMPUTATION

If the flight crew suspects that the FMS predictions are erroneous (slow computations, slightly erroneous values, etc.) and if the previous actions remain not successful, in order to recover the FMS predictions, the flight crew should:

- Copy of the ACTIVE F-PLN into a SEC F-PLN
- Remove the STAR procedure of the ACTIVE F-PLN

  Note: *The STAR usually contains a lot of constraints which may disturb FMS predictions computations.*

- Insert again the STAR in the ACTIVE F-PLN, later during the flight.

SPURIOUS ENGINE OUT INDICATION

Ident.: DSC-22_20-90-30-00012673.0001001 / 17 MAR 17
Applicable to: ALL

PROCEDURE

If a spurious engine-out is detected:

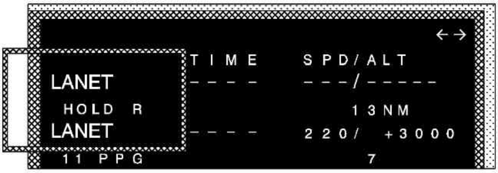
PRESS the EO CLR prompt of the MCDU PERF page
RE-ENGAGE previous vertical mode
RE-ENTER preselected speeds (if any). No other consequences are to be expected.

INCORRECT MANAGEMENT OF SPD CSTR FOR ARRIVAL PROCEDURE HOLDS

Ident.: DSC-22_20-100-20-00013647.0001001 / 16 MAR 11

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

A procedure Holding Pattern (HOLD) is part of a navigation database procedure. The flight crew cannot manually insert it in the flight plan.
The aircraft flies the HOLD one time, and exits it automatically at the HOLD fix.



```
                                    ←→
         TIME    SPD/ALT
LANET    ----    ---/-----
 HOLD R           13NM
LANET    ----    220/ +3000
  11 PPG            7
```

Procedure HOLD on the F-PLN MCDU page

The FMS computes procedure HOLDs based on the predicted speed of the aircraft at the pattern entry. For an arrival procedure HOLD, the FMS-predicted speed takes into account:

- The ICAO-fixed speed limit for the hold,
- Any speed constraint coded at the hold entry fix.

Some operators reported the following misbehaviour : if charts indicate a speed constraint for a procedure HOLD, the FMS erroneously applies this speed constraint only at the exit fix, instead of the entry fix. As a consequence, the FMS-predicted HOLD speed does not take the speed constraint into account.
As a result, the FMS may compute the HOLD based on a speed that is higher than required. In such a case, the HOLD will have a size larger than expected.

Note: *If the flight crew reverts to selected speed to reduce the speed at the HOLD entry, the FMS will not re-compute the size of the HOLD.*

OPERATIONAL RECOMMENDATION

During descent preparation :

- Use the charts to CHECK if the arrival procedure includes a HOLD that has a speed constraint.
- If the arrival procedure includes a HOLD that has a speed constraint : ENTER MANUALLY the speed constraint at the hold entry fix.

MISALIGNMENT OF FMS F-PLN LEGS FOR ILS APPROACHES

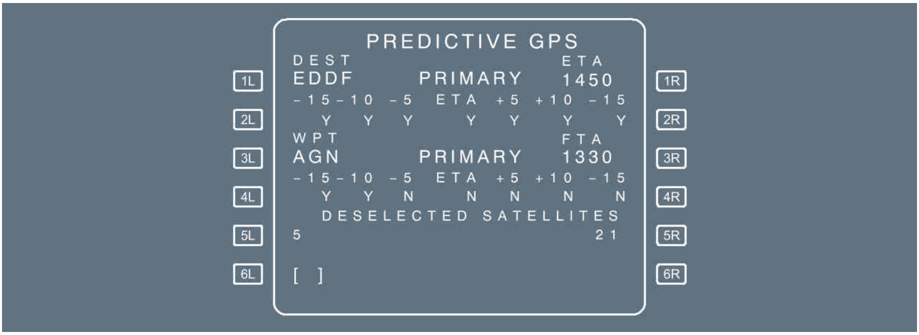
Ident.: DSC-22_20-100-20-00013650.0001001 / 23 JUN 15
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

For the F-PLN legs belonging to an ILS approach, the FMS incorrectly uses its own Magnetic Variation table instead of the Magnetic Variation of the ILS associated to the approach (coded in the Navigation Data Base). This misbehaviour occurs when the Navaid used for the ILS approach is a DME.
In some cases, it may happen that magnetic variation of the airport differs by a few degrees from the ILS navaid. Thus, the FMS F-PLN does not match with the actual beam of the ILS beam.
When the ILS approach is coded with successive legs, these legs may also appear as not matching with intermediate approach waypoint.
For all approaches affected by this behaviour, the FMS will display an incorrect trajectory on ND for the LS approach. The guidance would also be wrong if the approach legs are flown in NAV instead of LOC mode.

INCORRECT MANAGEMENT OF ETA ENTRY ON PREDICTIVE GPS PAGE

Ident.: DSC-22_20-100-20-00013652.0001001 / 22 MAY 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

During pre-flight, when a destination airport exists but the FMS does not compute predictions, amber boxes are displayed in the MCDU field ETA of the predicitve GPS page. When the flight crew manually enters an ETA, the value should be displayed in large cyan font.
With the current H2 standard, the FMS does not take into account the manual entry of an ETA (field 1R) for the destination (DEST, field 1L).
The FMS validates the manual entry only when an ETA is already computed by the FMS, when predictions are available (necessary conditions to have some predictions are : entry of a GW, CRZ FL, CI and F-PLN).
This anomaly does not impact the ETA of the WPT field (3L and 3R). An ETA can be entered in the field 3L even if no predictions are computed.



```
           PREDICTIVE GPS
DEST                            ETA
EDDF          PRIMARY           1450

FLIGHT NUMBER ERASED UPON AOC FLIGHT PLAN UPLINK

Ident.: DSC-22_20-100-20-00013653.0001001 / 16 MAR 11

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

When a Flight Plan (F-PLN) uplink is performed, if the uplinked F-PLN is inserted as the active F-PLN but does not contain a Flight Number, the previously entered Flight Number is erased. In such a case, the flight crew needs to re-enter the correct Flight Number on the INIT A page.

LOSS OF FMS POSITION FURTHER TO IRS LOSS

Ident.: DSC-22_20-100-20-00013654.0001001 / 23 JUN 15

1 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

The loss or the failure of an Inertial Reference System (IRS) could result in the loss of the FMS position with the following cockpit effects :

- MAP NOT AVAIL GPS, PRIMARY LOST displayed on ND
- The DIR TO page is unavailable on both MCDU
- During approach, transient ATHR thrust variations at autopilot disconnection (Only applicable in case of IR 1 FAULT).

Technical explanation :

The FMS needs valid data from the IRS in order to compute a position.

The FMS checks the IRS data with a specific parameter coming from the Flight Guidance (FG) part of the FMGC. When an IRS is lost or off (dispatched inoperative), the onside FG erroneously indicates to the FMS that the IRS DATA is still valid.

As a result, the FMS position is lost on the same side than the IRS inoperative (IRS1 for FMS1 and IRS for FMS2). The manual switching on IRS 3 (ATT HDG on CAPT 3 or F/O 3) does not enable to recover the data.

PROCEDURE:

In case of an IR x FAULT ECAM warning in flight with the above mentioned cockpit effects, apply the following procedure :
De-activate (do not perform a reset) the FMS on the same side than the IRS inoperative :

- For IR 1 FAULT : pull FMGC 1 CB B2 (VU 49)
- For IR 2 FAULT : pull FMGC 2 CB M17 (VU 121)

ERRONEOUS FUEL PREDICTION IN THE CASE OF DESCENT WITH TWO ALTITUDE CONSTRAINTS

Ident.: DSC-22_20-100-20-00013655.0001001 / 16 MAR 11

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

DESCRIPTION:

If the flight plan has two altitude constraints for the descent, the flight crew may notice erroneous FMS fuel predictions.

EXPLANATION

If the flight plan has two altitude constraints for the descent, the FMS may define a geometric segment between both altitude constraints. If there is a deceleration required within the geometric segment, the FMS may consider that the geometric segment is too steep to fly without speedbrakes. In this case, the FMS tags the entire geometric segment as a speedbrake segment : The FMS assumes that during the entire segment half of the speedbrakes are extended, even for the parts where no deceleration is planned. As a consequence, the FMS will predict an increased thrust for the entire geometric segment. This may lead to erroneous fuel predictions. (a long geometric segment (e.g. above 100 NM) may lead to an error of 1.5 t for the fuel prediction at destination).

Note: *When flying the geometric segment, the predictions become better as the aircraft approaches the end of the geometric segment, and turn back to normal when the aircraft has sequenced the second altitude constraint.*

PROCEDURE:

If the flight crew suspects this behavior in preflight, or during the flight, they can delete and enter again one altitude constraint in descent and compare the fuel predictions of the flight plan with and without the geometric segment. This allows the flight crew to evaluate the impact of the geometric segment on the fuel predictions.
It is not recommended to permanently delete altitude constraints that are stored in the navigation database.

UNEXPECTED SWITCH OF SPEED TARGET WHEN RTA IS USED

Ident.: DSC-22_20-100-20-00013659.0001001 / 16 NOV 11

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

An anomaly could be experienced when the RTA (Requested Time of Arrival) function is used.
The MCDU and the PFD could suddenly display an erroneous speed target at the transition altitude when a RTA is entered and if the flight crew performs an action (Vapp entry or altitude constraint modification) that causes a F-PLN profile recomputation.
This scenario could also occur if the flight crew has inserted a RTA and then deleted this RTA (the FMS may erroneously retain the RTA target).
Some cases could happen while the aircraft is in descent (DES mode) in managed speed. This speed target change is significant at high altitude if the RTA speed target is lower than the speed target used before the beginning of the descent.

PROCEDURE

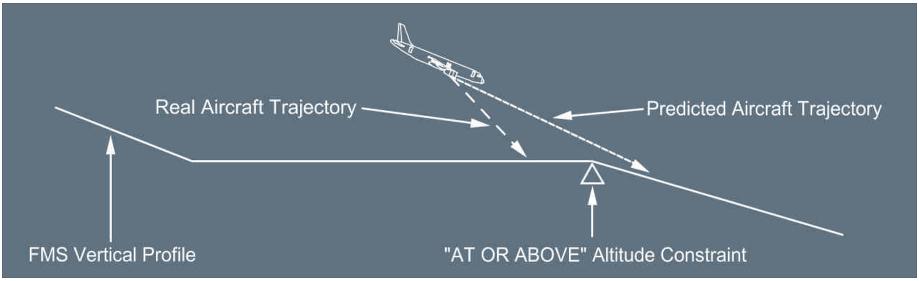
If an erroneous speed target is displayed at high altitude, the flight crew can manually select a speed to continue the descent.

UNDUE AP DISCONNECTION OR REVERSION TO V/S DURING CLIMB AND DESCENT

Ident.: DSC-22_20-100-20-00014436.0017001 / 23 JUN 15

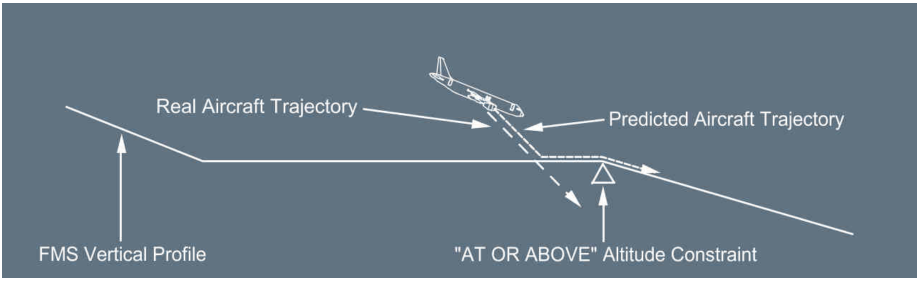
3 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

An AP disconnection or a reversion to the V/S mode may occur when the aircraft reaches an altitude constraint in the CLB or DES mode. The following are two situations in which this behavior may occur.
Situation 1: The aircraft is above the vertical profile.
When the aircraft is not on the vertical profile, the FMS makes assumptions in order to compute the FMS predictions. For example, if the aircraft flies in selected speed, the FMS considers an immediate return to managed speed.
These assumptions can result in FMS predictions that are not consistent with the real trajectory of the aircraft. Therefore, the FMS may not anticipate the need to level off, when the FCU selected altitude is above the altitude constraint in climb or below the altitude constraint in descent.



Real Aircraft Trajectory
Predicted Aircraft Trajectory
FMS Vertical Profile
"AT OR ABOVE" Altitude Constraint

However, the FMS requests the ALT CST* mode, when the aircraft reaches the altitude constraint, in order to level off and comply with the altitude constraint.
Due to problem of communication between the FMS and the FG, the FMGC may unduly revert to the V/S mode. The FWC triggers a triple-click aural warning ◁ , and the aircraft goes beyond the altitude constraint.

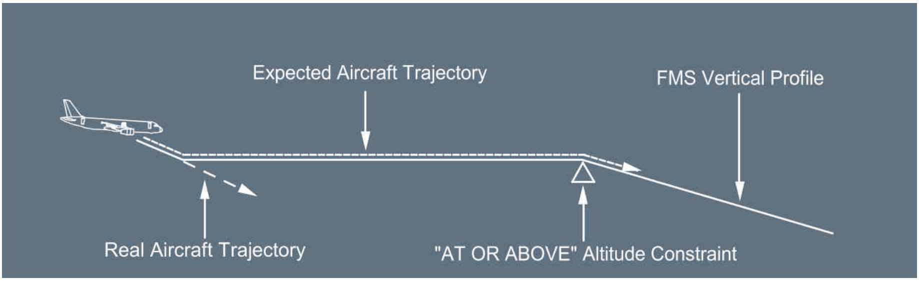


Real Aircraft Trajectory
Predicted Aircraft Trajectory
FMS Vertical Profile
"AT OR ABOVE" Altitude Constraint

Situation 2: The aircraft levels off at an altitude constraint in descent.
When the aircraft reaches an altitude constraint with the DES mode engaged and the FCU selected altitude below the altitude constraint, the FG engages the ALT CST* mode. The FG also arms the DES mode, in order to resume the descent beyond the waypoint with the altitude constraint.

In very rare cases, the FMS does not see that the FG arms the DES mode:
- If the FINAL APP mode is armed, the FMGC may unduly:
  - Disconnect the AP, or
  - Disconnect the AP and revert to the V/S mode, or
  - Revert to the V/S mode.
- If the FINAL APP mode is not armed, the FMGC may unduly revert to the V/S mode.

In both of the above-mentioned cases, the FWC triggers a triple-click aural warning ◁ , and the aircraft goes beyond the altitude constraint.
If the AP disconnects, the FWC triggers a cavalry-charge aural warning.



Expected Aircraft Trajectory
FMS Vertical Profile
Real Aircraft Trajectory
"AT OR ABOVE" Altitude Constraint

OPERATIONAL RECOMMENDATIONS

Understand your FMA at all times.

- **If the AP disconnects, or if the FMGC reverts to the V/S mode:**

  Adjust the vertical speed or level off in order to comply with the altitude constraint.

VOR/DME AND VOR/TACAN NOT AUTOMATICALLY TUNED

Ident.: DSC-22_20-100-20-00014440.0001001 / 04 MAY 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

In case there is no NAVAID in the flight plan, nor any recommended NAVAID coded in the inserted procedure, the FMS may not automatically tune the expected Terminal or Low Altitude VOR/DME or VOR/TACAN.
The FMS may not automatically tune the expected NAVAID, if the aircraft is above 12 000 ft for a Terminal VOR/DME or VOR/TACAN, and above 18 000 ft for a Low Altitude NAVAID.
As a consequence, the ND and the MCDU RAD NAV page may not display the NAVAID information.

OPERATIONAL RECOMMENDATIONS

If the flight crew encounters the misbehavior during the flight, the flight crew can manually tune the expected VOR/DME or VOR/TACAN to recover the display on the ND.
As a manual tuning overrides any automatic tuning, the flight crew must clear the manual tuning, when the NAVAID is no longer required, in order to revert to the automatic NAVAID tuning.

OPTIMUM TARGET SPEEDS NOT UPDATED FOLLOWING THE AUTOMATIC DELETION OF A STEP CLIMB

Ident.: DSC-22_20-100-20-00014756.0001001 / 04 NOV 20

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

DESCRIPTION

During the FMS climb phase, if the flight crew selects an altitude on the FCU that is above the CRZ FL displayed on the PROG page, the altitude selected on the FCU becomes the new CRZ FL.
If this new CRZ FL is at or above the altitude of a Step Climb of the flight plan, the FMS automatically deletes the Step Climb. The FMS displays the STEP DELETED message.
As the optimum target speeds (ECON CLIMB speed/Mach and ECON CRUISE speed/Mach) depend on the CRZ FL, the FMS should immediately update the ECON CLIMB speed/Mach and the ECON CRUISE speed/Mach.
Due to a FMS misbehavior, the FMS may not correctly manage the automatic deletion of the Step Climb when the CRZ FL is automatically set to the altitude selected on the FCU. The FMS may not update the ECON CLIMB speed/Mach and the ECON CRUISE speed/Mach accordingly.
If the ECON CRUISE speed/Mach was not correctly updated, the FMS updates the ECON CRUISE speed/Mach when the aircraft reaches the new CRZ FL. However, the FMS updates the ECON CRUISE speed/Mach with a rate of 0.01 Mach/min, in order to avoid sudden increase of the target speed. Therefore, the aircraft may take several minutes to reach the new ECON CRUISE speed/Mach.

OPERATIONAL RECOMMENDATIONS

- **If the flight crew suspects this misbehavior during the flight and the FMS is in CLIMB phase:**

  CHANGE the CI or the CRZ FL on the PROG page, the optimum target speed is updated when the aircraft reaches the CRZ FL.

- **If the flight crew suspects this misbehavior during the flight and the FMS is in CRUISE phase:**

  The optimum target speed is updated with a rate of 0.01 Mach/min when the aircraft reaches the FCU altitude.

ERRONEOUS LATERAL GUIDANCE IN NAV MODE WITH LOC MODE ARMED DURING APPROACH

Ident.: DSC-22_20-100-20-00015035.0001001 / 26 OCT 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

During approach, the FMS may guide the aircraft along a specific track instead of along the F-PLN with NAV mode green on the FMA, because of the LOC Convergence function (*Refer to DSC-22_30-40-80-10 LOC* Engagement Conditions - LOC Convergence Function*).
The logics of the LOC Convergence function is as follows:

- **If NAV mode is engaged, and LOC mode is armed,**
  and
  The aircraft is within 20 NM of the destination runway,
  and
  The difference between the aircraft track and the QFU is less than 20 °.

  The aircraft is guided with a converging track of 20 ° from the LOC axis.

  The NAV mode remains engaged. However the aircraft no longer follows the F-PLN, but converges towards the LOC axis.

- **If the difference between the aircraft track and the QFU becomes more than 20 ° when the LOC Convergence function is active:**

  The FMS deactivates the LOC Convergence function, and the aircraft follows back the F-PLN.

  It may lead to slight oscillations, since the FMS may successively activate and deactivate the LOC Convergence function.

OPERATIONAL RECOMMENDATIONS

- **If the flight crew considers that the LOC Convergence function may affect the guidance along the F-PLN trajectory in NAV mode:**

  On the intercept trajectory for the LOC axis, the flight crew should push the APPR pb (or the LOC pb-sw) when appropriate.

- **If the flight crew detects that the aircraft does not follow the intended trajectory:**

  The flight crew should revert to HDG/TRK mode, and intercept the LOC axis with the HDG/TRK mode engaged and the LOC mode armed.

UNDUE REDUCTION OF THE SPEED TARGET IN CASE OF DIR TO/ABEAM WHILE FLYING A CONSTANT MACH SEGMENT

Ident.: DSC-22_20-100-20-00015532.0003001 / 18 MAR 14
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The FMS may erroneously command a Mach target of 0, when the following conditions are met:
- The aircraft is flying a Constant Mach Segment (CMS), and
- The TO waypoint is the end of the CMS, and
- The aircraft is close to the TO waypoint, i.e. about 1 NM, and
- The flight crew performs a DIR TO/ABEAM to a waypoint that is not part of the CMS.

In that case, the FMS does not create the abeam of the TO waypoint (end of the CMS), since it is too close from the aircraft.
In addition, the FMS erroneously keeps the CMS until the abeam of the next waypoint, and defines 0 as Mach target on the CMS. The FMS correctly computes the speed target once the abeam of the next waypoint is sequenced.

OPERATIONAL RECOMMENDATIONS

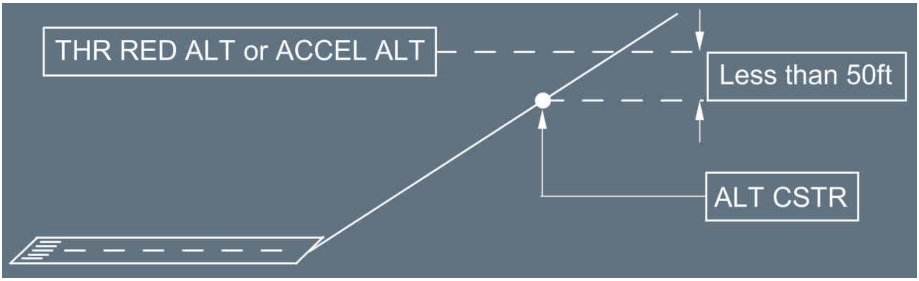
The flight crew should manually clear the CMS on the MCDU VERT REV page.

LOSS OF FUEL AND TIME PREDICTIONS DURING TAKEOFF DATA INSERTION

Ident.: DSC-22_20-100-20-00015602.0001001 / 05 AUG 14
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

The flight crew may lose fuel and time prediction when the altitude of the first constraint is less than 50 ft below either the THR RED ALT or the ACC ALT, the update of fuel and time computation predictions may last a long time. The flight crew may think that the predictions are lost (the DEST EFOB and TRIP FUEL are also dashed on the FUEL PRED page).

The flight crew may encounter the situation described above, if one of the following occurs:
- The first altitude constraint of the SID is less than 50 ft below either the THR RED ALT or the ACC ALT.
- The flight crew inserts a THR RED ALT or an ACC ALT less than 50 ft above the first altitude constraint of the F-PLN.
- The flight crew modifies the F-PLN to insert an AT or an AT OR BELOW altitude constraint less than 50 ft below the THR RED ALT or the ACC ALT.



OPERATIONAL RECOMMENDATION:

The flight crew can recover the fuel and time predictions if the flight crew sets the THR RED ALT or ACC ALT value on the PERF TAKEOFF page to the same value as the first altitude constraint of the F-PLN.

ERRONEOUS TRAJECTORY DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

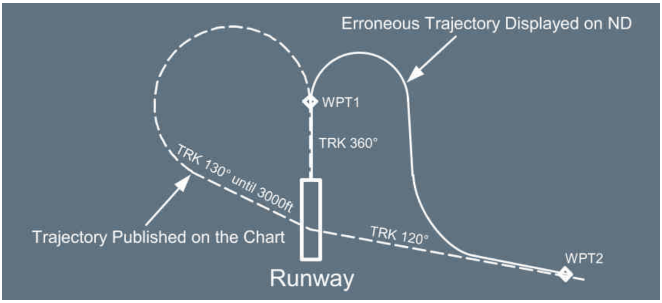
Ident.: DSC-22_20-100-20-00015748.0001001 / 09 SEP 14
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

In some very specific operational conditions that depend on the coding in the Navigation Database of the procedure, and on various performance conditions (aircraft weight, flaps, thrust setting, temperature, wind...), the FMS may compute an erroneous trajectory on some Standard Instrument Departures (SID), and on some Missed Approach procedures.

The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude
- A Holding-to-an-Altitude (HA) leg that defines a holding pattern to an altitude

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some very specific operational conditions (aircraft weight, wind...), the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, the FMS ignores the leg, and the associated turn direction.
The FMS computes a new trajectory to directly join the next leg. The trajectory may not be consistent with the published trajectory.

Example:
- Leg 1: a Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: a Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the MCDU
- Leg 3: a CF leg that defines a track (120 °) to a waypoint (WPT2)



Erroneous Trajectory Displayed on ND
WPT1
TRK 360°
TRK 130° until 3000ft
Trajectory Published on the Chart
TRK 120°
WPT2
Runway

Depending on the aircraft performance, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.

As a result, the FMS computes again the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CF leg).

If the NAV mode is engaged, the aircraft follows this erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

If the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should revert to the HDG/TRK mode, and monitor NAVAID raw data as appropriate.

The flight crew should reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

ERRONEOUS TRAJECTORY WHILE IN HDG (TRK) MODE DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

Ident.: DSC-22_20-100-20-00023728.0001001 / 26 NOV 19
4 **Applicable to: MSN 10949-11597**

DESCRIPTION

In some very specific operational conditions that depend on the coding in the Navigation Database of the procedure, and on various performance conditions (aircraft weight, flaps, thrust setting, temperature, wind ...), the FMS may compute an erroneous trajectory.

The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude
- A Holding-to-an-Altitude (HA) leg that defines a holding pattern to an altitude.

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some very specific operational conditions, the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, the FMS ignores the leg and the associated turn direction.
The FMS computes a new trajectory to directly join the next leg. The trajectory may not be consistent with the published trajectory.
The abnormal behavior depends on the AP/FD lateral modes engaged.

After takeoff, the NAV mode engages. At any time before the end of the altitude termination leg:
- If the NAV mode stays engaged, the FMS will compute a trajectory consistent with the published trajectory
- If the HDG/TRK mode is engaged, the FMS may compute an erroneous trajectory and display it on the ND. If the flight crew engages the NAV mode, the aircraft will follow the erroneous trajectory.

Example:
- Leg 1: A Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: A Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the F-PLN page of the MCDU.
- Leg 3: A CF leg that defines a track (120 °) to a waypoint (WPT2).

TRK 360°
TRK 130° until 3000ft
TRK 120°
WPT2
Trajectory Published on the Chart
Runway

Depending on the aircraft performance, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, if the HDG/TRK mode is engaged, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.
As a result, the FMS computes again the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CF leg). This erroneous trajectory will be displayed on the ND.
If flight crew reengages the NAV mode before the end of the altitude termination leg, the aircraft follows this erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

When in HDG/TRK mode after takeoff or go around initiation, if the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should keep the HDG/TRK mode engaged, and monitor NAVAID raw data as appropriate.
The flight crew should only reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

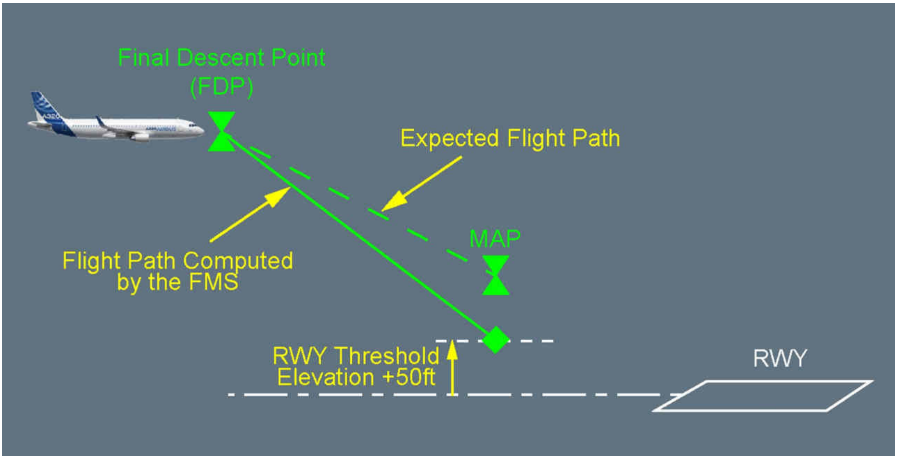
ERRONEOUS VERTICAL PROFILE DURING LOC B/C APPROACHES WITH A MAP LOCATED BEFORE THE RUNWAY THRESHOLD

Ident.: DSC-22_20-100-20-00019782.0001001 / 25 JUL 16

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

DESCRIPTION

When the flight crew selects a LOC Back Course (LOC B/C) approach in the arrival page of the MCDU, if the Missed Approach Point (MAP) is located before the runway threshold, the FMS builds the final approach vertical flight path assuming that there is an altitude constraint at the MAP, equal to the runway (RWY) threshold elevation plus 50 ft, disregarding the actual coded MAP altitude.
As a result, the FMS computes an erroneous vertical flight path for the final approach, an erroneous crossing altitude at the MAP, and displays an erroneous vertical deviation indication (V/DEV symbol on the PFD and V/DEV value on MCDU PROG page), when flying the approach.



Therefore, the flight crew must fly the LOC B/C approaches in selected vertical guidance mode (FPA or V/S mode), and they must disregard the V/DEV displayed on the PFD and MCDU PROG page.

PROCEDURE

For LOC B/C approaches, check the position of the MAP on the approach chart:

- **If the MAP is located at the runway threshold:**
  V/DEV symbol can be used to assist the flight crew in flying the vertical flight path in selected mode. Crosscheck the final descent with the published chart using altitude versus distance, as per Standard Operating Procedures (SOPs).
- **If the MAP is located before the runway threshold:**
  DISREGARD the V/DEV symbol, and crosscheck the final descent using the altitude versus the distance to the MAP.

ERRONEOUS VERTICAL GUIDANCE IN APPROACH SUBSEQUENT TO A DIR TO PERFORMED WHEN NEAR THE TOP OF DESCENT

Ident.: DSC-22_20-100-20-00022771.0001001 / 05 MAR 19
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

DESCRIPTION

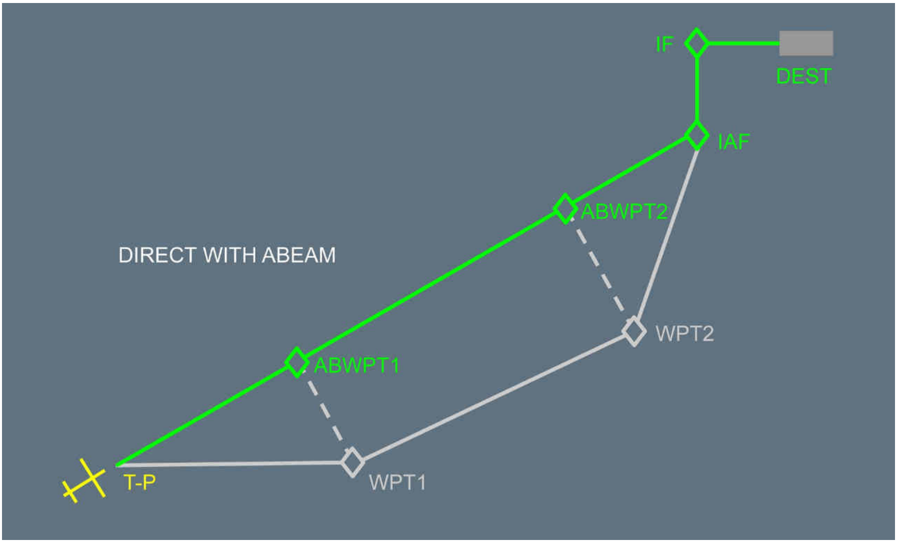
When the flight crew inserts a DIR TO waypoint, the FMS computes the horizontal path to the destination. When near the top of descent, if the flight crew inserts a DIR TO waypoint that is at, or after the IAF, the FMS computation may be erroneous for all of the following:

- The distance of the legs after the DIR TO waypoint.
- The vertical deviation on the legs after the DIR TO waypoint.
- The vertical guidance in DES and FINAL APP modes.

In order to compute the turn radius of the horizontal path, the FMS uses the current TAS at the time of the DIR TO insertion.This is the cause to the erroneous calculation. Instead, the FMS should use the TAS that is predicted at the DIR TO waypoint.

PROCEDURE

When near the top of descent, to insert a DIR TO waypoint that is at or after the IAF, the flight crew should use the DIRECT WITH ABEAM (ABEAM PTS) function. The flight crew must then check that at least one abeam waypoint is computed ahead of the position of the aircraft.
For more information on the DIRECT WITH ABEAM function, *Refer to DSC-22_20-30-10-15 DIR Key (Direct-to-Function) - Procedure for DIR TO/ABEAM*.



IF
DEST
IAF
ABWPT2
DIRECT WITH ABEAM

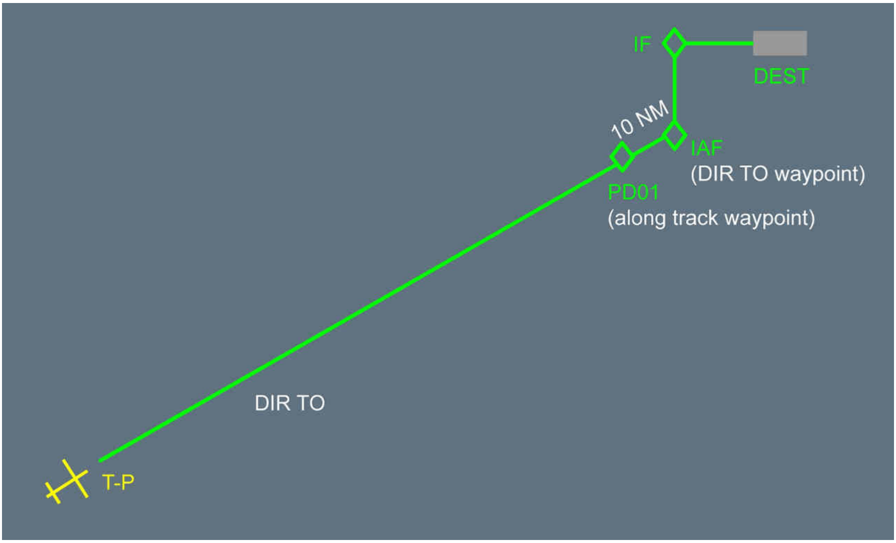
ABWPT1
T-P
WPT1

If there is no abeam waypoint computed, the flight crew must insert a Place Distance waypoint 10 NM before the DIR TO waypoint. (*Refer to DSC-22_20-30-10-15 Inserting a Waypoint - Along Track Waypoint Insertion*)



NO ENGAGEMENT OF THE PRESEL SPD TARGET IN CLIMB

Ident.: DSC-22_20-100-20-00023539.0002001 / 26 NOV 19

5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

DESCRIPTION

This misbehavior is experienced if the flight crew entered a PRESEL SPD TARGET in the FMS PERF CLIMB page and when the following occurs simultaneously:
- FMS transition from TAKEOFF to CLIMB phase, and
- A F-PLN leg is sequenced by the FMS.

EXPLANATION

The FMS transition from TAKEOFF to CLIMB phase occurs in the following cases:
- The aircraft reaches the ACCEL ALT entered in the FMS PERF TAKEOFF page, or
- The SRS mode disengages and another vertical mode such as ALT* engages.

At the activation of the CLIMB phase, when a PRESEL SPD TARGET is set in the FMS PERF CLIMB page and A/THR is active, the FMS orders to synchronize the FCU SPD target to the preselected value and go to selected SPD mode automatically.
When a F-PLN leg is sequenced at the same time than the activation of the CLIMB phase, the FMS gives the priority to the leg sequencing process. Then, the PRESEL SPD TARGET is not taken into account. In such condition the PRESEL SPD TARGET entered in the FMS PERF

CLIMB page is disregarded and the aircraft accelerates to reach the MANAGED SPD TARGET displayed on the FMS PERF CLIMB page.

OPERATIONAL RECOMMENDATION

If the PRESEL SPD TARGET is not taken into account after the FMS transition from TAKEOFF to CLIMB phase, the flight crew should revert to selected speed mode and select the SPD TARGET on the FCU.

ERRONEOUS CF LEG COMPUTATION FOLLOWING FMS NEW RUNWAY WITH LS IDENT CREATION

Ident.: DSC-22_20-100-20-00023647.0001001 / 26 NOV 19

6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

DESCRIPTION

The flight crew may experience this abnormal behavior if a runway and its associated LS IDENT is created via the FMS NEW RUNWAY page.

If the flight crew creates a runway and its associated LS (LS IDENT of the FMS NEW RUNWAY page), the FMS considers this NAVAID as the recommended NAVAID for the newly created runway.
This created NAVAID does not have an associated magnetic variation in the FMS. Thus, the FMS may apply an erroneous magnetic variation and may compute an erroneous course for the CF leg.

OPERATIONAL RECOMMENDATION

In the case of runway creation, the flight crew should not insert an LS IDENT on the FMS NEW RUNWAY page.

If the flight crew plans to perform an ILS approach on the newly created runway, the ILS should be tuned via either of the following:
- The FMS RADIO NAV page, or
- The RMP.

UNEXPECTED ILS AUTO-TUNING

Ident.: DSC-22_20-100-20-00024029.0001001 / 28 MAY 20

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

DESCRIPTION

The FMS may erroneously automatically tune an ILS frequency in the following two cases:
- After selection of an ILS approach, the flight crew changes the approach and selects a RWY-only or Visual approach that is not associated with an ILS frequency, or
- The flight crew selects a RWY-only approach that is associated to an ILS frequency.

OPERATIONAL RECOMMENDATION

If the flight crew identifies an unexpected tuning of an ILS frequency by the FMS, the flight crew should do one of the following:
- Insert the ILS frequency 108.00 in the FMS RAD NAV page, or
- Insert the ILS frequency 108.00 in the RMP.

Note: 108.00 is the default value of ILS frequency that is not associated with an ILS approach.

ERRONEOUS MANAGED APPROACH SPEED AFTER DESCENT WIND UPLINK

Ident.: DSC-22_20-100-20-00024052.0003001 / 28 MAY 20

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324

DESCRIPTION

This misbehaviour is encountered in the following conditions:
- The flight crew inserts the uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on the DESCENT WIND page)
- The flight crew does not manually reinsert the wind at destination on the PERF APPR page.

In the case of the uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on the DESCENT WIND page), all of the following apply:
- The FMS correctly receives and uses the wind at destination
- The wind at destination correctly appears on the PERF APPR page
- The FMS erroneously transmits the wind at destination to the Flight Guidance Computer for GSmini computation.

As a result, the managed approach speed that appears on PFD and which is used for guidance by the Flight Guidance Computer may be erroneously increased, depending on the current headwind that the flight crew encounters.

OPERATIONAL RECOMMENDATION

Starting from the DESCENT PREPARATION phase of the Standard Operating Procedures, the flight crew should manually reenter the wind at destination on the PERF APPR page, each time an uplink of an AOC DESCENT WIND that contains wind at destination (GRND wind appears on DESCENT WIND page) is performed. And this recommendation applies whatever the value of the wind at destination, which appears on the PERF APPR page, subsequent to the uplink. This applies even if the value to reenter on the PERF APPR page is exactly the same value.

LOSS OF FMS PREDICTIONS IN LOW DENSITY OF AIRPORTS

7 Ident.: DSC-22_20-100-20-00026317.0001001 / 03 NOV 22
Applicable to: MSN 10949-11597

DESCRIPTION

The FMS may encounter temporary and repetitive loss of predictions in the flight plan of the MCDU during flight, if the FMS finds only 4 airports in the Navigation Database within 1 200 NM from the aircraft position.
The occurrence rate increases when the flight crew enters a 5th airport on [5L] key of the CLOSEST AIRPORTS page.

Note: *During the occurrence, the UTC fields of the 4th and 5th (when entered) airports are dashed in the CLOSEST AIRPORTS page.*

The loss of the time prediction for more than 5 minutes can trigger a FWD fuel transfer from the TRIM tank.

OPERATIONAL RECOMMENDATION

The flight crew should clear the 5th airport in the CLOSEST AIRPORTS page to recover the full FMS predictions.
To avoid new occurrences in flight, the operator should request the FMS supplier to modify the Navigation Database to increase the number of available airports, on the flight routes affected by the loss of predictions. A minimum of 5 airports must be available within 1 200 NM of all expected flight plans.

Intentionally left blank

MCDU FROZEN AFTER THE FLIGHT CREW ACCESSES THE "DIR TO", "HOLD" OR "OFFSET" FUNCTION

Ident.: DSC-22_20-100-30-00012686.0001001 / 21 MAR 17
Applicable to: MSN 04827-04860

When the flight crew attempts to access the “DIR TO” function (via the DIR), the “HOLD” function (via the HOLD prompt on the LAT REV MCDU page) or the "OFFSET" function (via the OFFSET prompt on the LAT REV MCDU page), the corresponding MCDU may remain frozen.
In such a case, the MCDU simultaneously displays an “A/C POSITION INVALID” scratchpad message, in white (note that in other cases of display, the “A/C POSITION INVALID” message is amber).

PROCEDURE

If the MCDU is frozen after the flight crew accesses the “DIR TO”, “HOLD” or "OFFSET" function:

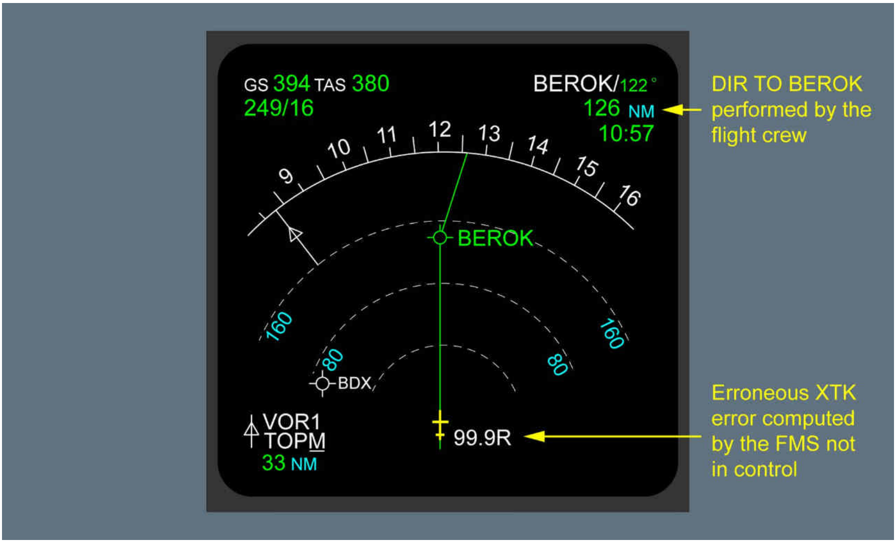
APPLY the manual reset procedure provided (*Refer to procedure*) to successively reset both FMGCs.

ERRONEOUS CROSS TRACK ERROR/FD DISPLAY ORDERS AFTER A DIR TO ON ALIGNED WAYPOINT

Ident.: DSC-22_20-100-30-00013636.0002001 / 26 NOV 19
Applicable to: MSN 04827-04860

DESCRIPTION

Erroneous cross track errors (XTK) and FD orders fluctuations have been reported when a DIR TO is performed to a waypoint ahead, with no heading change.
In these conditions, some time after the DIR TO, the FMS not in control (“slave FMS”) may compute an erroneous XTK using as the reference the next leg after the DIR TO waypoint (the corresponding FD order being based on this erroneous cross track).
However, the XTK and FD of the FMS in control remain correct.
If later, the flight crew switches the autopilot to the affected FMS side, the aircraft guidance will become erroneous.



DIR TO BEROK performed by the flight crew

Erroneous XTK error computed by the FMS not in control

OPERATIONAL RECOMMENDATION:

The flight crew should perform a new DIR TO to recover a correct XTK/FD behaviour.

ERRONEOUS FUEL PREDICTIONS IN THE CASE OF DESCENT WITH TWO ALTITUDE CONSTRAINTS

Ident.: DSC-22_20-100-30-00013638.0001001 / 16 MAR 11
Applicable to: MSN 04827-04860

DESCRIPTION:

If the flight plan has two altitude constraints for the descent, the flight crew may notice erroneous FMS fuel predictions.

EXPLANATION:

If the flight plan has two altitude constraints for the descent, the FMS may define a geometric segment between both altitude constraints. If there is a deceleration required within the geometric segment, the FMS may consider that the geometric segment is too steep to fly without speedbrakes. In this case, the FMS tags the entire geometric segment as a speedbrake segment : The FMS assumes that during the entire segment half of the speedbrakes are extended, even for the parts where no deceleration is planned. As a consequence, the FMS will predict an increased thrust for the entire geometric segment. This may lead to erroneous fuel predictions. (a long geometric segment (e.g. above 100 NM) may lead to an error of 1.5 t for the fuel prediction at destination).

Note: *When flying the geometric segment, the predictions become better as the aircraft approaches the end of the geometric segment, and turn back to normal when the aircraft has sequenced the second altitude constraint.*

PROCEDURE:

If the flight crew suspects this behavior in preflight, or during the flight, they can delete and enter again one altitude constraint in descent and compare the fuel predictions of the flight plan with and without the geometric segment. This allows the flight crew to evaluate the impact of the geometric segment on the fuel predictions. It is not recommended to permanently delete altitude constraints that are stored in the navigation database.

ERRONEOUS LATERAL GUIDANCE IN NAV MODE WITH LOC MODE ARMED DURING APPROACH

Ident.: DSC-22_20-100-30-00015036.0001001 / 05 JUN 18
Applicable to: MSN 04827-04860

During approach, the FMS may guide the aircraft along a specific track instead of along the F-PLN with NAV mode green on the FMA, because of the LOC Convergence function.
The logics of the LOC Convergence function is as follows:

- **If NAV mode is engaged, and LOC mode is armed,**
  and
  The aircraft is within 20 NM of the destination runway,
  and
  The difference between the aircraft track and the QFU is less than 20 °.

  The aircraft is guided with a converging track of 20 ° from the LOC axis.

  The NAV mode remains engaged. However the aircraft no longer follows the F-PLN, but converges towards the LOC axis.

OPERATIONAL RECOMMENDATIONS

- **If the flight crew considers that the LOC Convergence function may affect the guidance along the F-PLN trajectory in NAV mode:**

  On the intercept trajectory for the LOC axis, the flight crew should push the APPR pb (or the LOC pb-sw) when appropriate.

- **If the flight crew detects that the aircraft does not follow the intended trajectory:**

  The flight crew should revert to HDG/TRK mode, and intercept the LOC axis with the HDG/TRK mode engaged and the LOC mode armed.

ERRONEOUS TRAJECTORY COMPUTATION WHILE IN HDG/TRK MODE DURING PROCEDURES WITH A TURN DIRECTION ON A LEG WITH AN ALTITUDE TERMINATION

Ident.: DSC-22_20-100-30-00019778.0001001 / 08 JUL 16
Applicable to: MSN 04827-04860

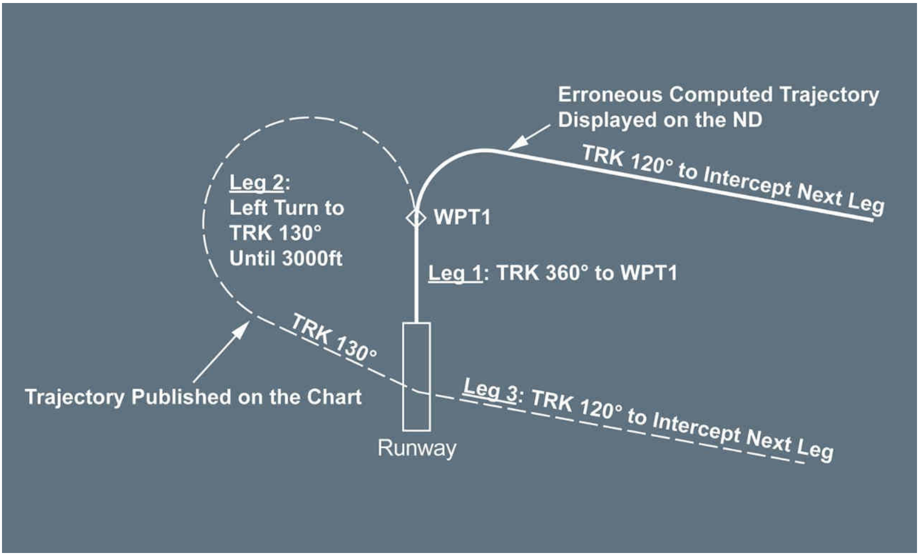
In some specific conditions that depend on the coding in the Navigation Database of the procedure, and on climb performance of the aircraft, the FMS may compute an erroneous trajectory on some Standard Instrument Departures (SID), and on some Missed Approach procedures, when the aircraft is in HDG/TRK mode.

The SIDs and the Missed Approach procedures that may be affected are coded in the Navigation Database with a leg that has both a turn direction and an altitude termination. The leg can be one of the following:
- A Course-to-an-Altitude (CA) leg that defines a course to follow to an altitude
- A Fix-to-an-Altitude (FA) leg that defines a track to follow from a waypoint to an altitude
- A Heading-to-an-Altitude (VA) leg that defines a heading to follow to an altitude

The turn direction (left or right) that is coded on a leg indicates that the aircraft has to execute a turn in the specified direction to intercept the leg.
In some specific operational conditions (light aircraft weight, strong headwind...), the FMS may predict that the aircraft will reach the altitude that terminates the leg, before the initiation of the leg. In that case, if the aircraft is in HDG/TRK selected mode, the FMS ignores the leg and the associated turn direction, and computes a new trajectory to join the next leg.
The trajectory may therefore not be consistent with the published trajectory.

Note: *The erroneous computation may happen only if the aircraft is in HDG/TRK mode. The erroneous computation does not happen as long as the aircraft stays in NAV mode.*

Example:
- Leg 1: a Course-to-Fix (CF) leg that defines a track (360 °) to a waypoint (WPT1)
- Leg 2: a Course-to-an-Altitude (CA) leg that defines a track (130 °) to intercept an altitude (3 000 ft). The leg is coded in the Navigation Database with a turn direction (left). The end of the leg depends on the aircraft performance. The turn direction is indicated by an arrow on the line of leg 1 on the MCDU
- Leg 3: a Course-to-Intercept (CI) leg that defines a track of 120 ° to follow until the interception of the next leg.



Erroneous Computed Trajectory Displayed on the ND
TRK 120° to Intercept Next Leg
Leg 2: Left Turn to TRK 130° Until 3000ft
WPT1
Leg 1: TRK 360° to WPT1
TRK 130°
Trajectory Published on the Chart
Leg 3: TRK 120° to Intercept Next Leg
Runway

Depending on the aircraft performance and the external conditions, the FMS may predict that the aircraft will reach 3 000 ft before WPT1. In that case, if the HDG/TRK mode is engaged, the FMS ignores the leg 2 (CA leg) because the aircraft is already above the altitude that ends leg 2, before the beginning of leg 2. The FMS also ignores the turn direction that is coded on the leg.
As a result, the FMS re-computes the trajectory from the end of leg 1, directly to leg 3. As shown on the above illustration, this trajectory includes a right turn, instead of a left turn, because it induces the shortest course change to intercept leg 3 (CI leg).
If the NAV mode is re-engaged after the new computation, the aircraft follows an erroneous trajectory.

OPERATIONAL RECOMMENDATIONS

The flight crew should pay particular attention to the check of the flight plan during the Cockpit Preparation, and during the Descent Preparation.

CAUTION	Even if the flight plan is correct during the Cockpit Preparation or during the Descent Preparation, the FMS may compute and display an erroneous trajectory when the FMS updates its predictions after takeoff or after go-around initiation.

When in HDG/TRK mode after takeoff or go around initiation, if the flight crew detects that the lateral flight plan does not agree with the published trajectory, the flight crew should stay in HDG/TRK selected mode, and monitor NAVAID raw data as appropriate.

The flight crew should only reengage the NAV mode when the lateral flight plan is consistent with the published trajectory.

UNCOMMANDED CLIMB NEAR THE TOP OF DESCENT (T/D)

Ident.: DSC-22_20-100-30-00021871.0001001 / 28 MAY 20
Applicable to: MSN 04827-04860

DESCRIPTION

When the inserted tropopause altitude is equal to the final FMS cruise flight level, the FMS can erroneously compute a very steep segment in the FMS vertical profile. A guidance anomaly can then order a pitch up to capture this steep segment while in DES mode.

In this case, an unexpected climb may occur when the following conditions are satisfied:

- Tropopause altitude is equal to final FMS cruise flight level (tropopause altitude can be manually entered on MCDU/INIT A page or received via an AOC uplink)
- DES mode is engaged before the T/D.

If this unexpected climb occurs, the aircraft pitches up and A/THR commands a thrust increase but speed may decrease.

OPERATIONAL RECOMMENDATION

■ **How to avoid unexpected climb at top of descent:**

The tropopause altitude entered or uplinked on MCDU/INIT A page must be different from the final FMS cruise flight level by at least 10 ft. The altitude of the final FMS cruise flight level is the flight plan altitude at the T/D. As the flight level may be selected on MCDU or FCU with an accuracy of 100 ft, tropopause altitude must be set to a value that is not a multiple of 100 ft.

For example, if the tropopause altitude is 37 000 ft, then the value 37 010 ft or 36 990 ft must be entered or uplinked on MCDU/INIT A page.

■ **How to manage an unexpected climb near the T/D:**

If the aircraft unexpectedly climbs near the T/D, the flight crew must disengage the DES mode or disconnect the AP/FD. DES mode can then be re-engaged once the T/D is sequenced and the aircraft is back on the FMS descent profile.

ERRONEOUS ALTITUDE CONSTRAINT AFTER SID OR STAR SELECTION CHANGE

Ident.: DSC-22_20-100-30-00022414.0001001 / 24 AUG 18
Applicable to: MSN 04827-04860

DESCRIPTION

When the flight crew changes the SID or the STAR procedure, the FMS may keep a constraint of the previous procedure after the change.
The condition of occurrence is that both SID(STAR) procedures have the same last(first) waypoint but with different associated altitude constraints.
At the first SID(STAR) selection, the waypoint is linked to the en-route flight plan and the FMS considers this waypoint as the first(last) en-route waypoint.
When the SID(STAR) is changed, the FMS may keep the constraint of the first(last) en-route waypoint rather than the constraint of the new selected SID(STAR).

Note: *The issue may also appear if the altitude constraint was inserted manually in the previous SID(STAR).*

PROCEDURE

As per SOP, the flight crew must compare the inserted SID(STAR), including constraints, with the charts and make corrections if necessary.

WAYPOINT NOT SEQUENCED AFTER DIR TO RADIAL IN

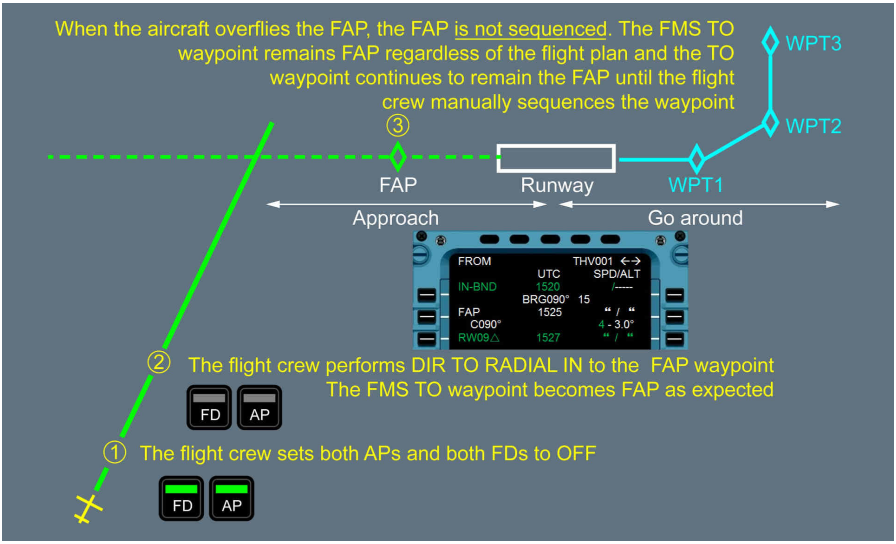
Ident.: DSC-22_20-100-30-00022530.0001001 / 18 SEP 18
Applicable to: MSN 04827-04860

DESCRIPTION

If the flight crew performs a DIR TO RADIAL IN with both APs and both FDs set to OFF, the FMS correctly computes the "DIR TO RADIAL IN waypoint" as the TO waypoint. The correct computation is confirmed by correct display on Navigation Display (ND) and Multipurpose Control and Display Unit (MCDU). However, the FMS will not sequence the newly-created TO waypoint when the aircraft overflies it. The FMS keeps it as the TO waypoint until the flight crew performs a manual sequencing.

Note: *If the flight crew performs the DIR TO RADIAL IN before they set both APs and both FDs to OFF, the FMS will correctly sequence the waypoint.*

The illustration below provides a typical example of the abnormal behavior:



When the aircraft overflies the FAP, the FAP is not sequenced. The FMS TO waypoint remains FAP regardless of the flight plan and the TO waypoint continues to remain the FAP until the flight crew manually sequences the waypoint

② The flight crew performs DIR TO RADIAL IN to the FAP waypoint The FMS TO waypoint becomes FAP as expected

① The flight crew sets both APs and both FDs to OFF

UNUSABLE MIN DEST FOB VALUE IN THE SECONDARY FLIGHT PLAN

Ident.: DSC-22_20-100-30-00022951.0001001 / 26 NOV 19
Applicable to: MSN 04827-04860

In some specific conditions the flight crew may observe that the EXTRA fuel value displayed on the FMS FUEL PRED page may not be equal to the difference between the "Predicted DEST EFOB value" and the "MIN DEST FOB value". This misbehavior may occur in either of the following cases:

- **If an ATC uplink is performed**

DESCRIPTION

This misbehavior may occur in the following case:
- The MIN DEST FOB value of the active F-PLN is not the computed value by the FMS, and
- A SEC F-PLN is created from an ATC uplink.

In this situation the MIN DEST FOB may not be copied in the SEC F-PLN.

RECOMMENDATION

Subsequent to the uplink of a new SEC F-PLN, the flight crew can detect this misbehavior if the MIN DEST FOB value is not copied in the SEC F-PLN. The EXTRA fuel value displayed on the FMS FUEL PRED page may no longer be equal to the difference between the "Predicted DEST EFOB value" and the "MIN DEST FOB value".

In this case, the flight crew should enter a MIN DEST FOB value in the SEC F-PLN.

● If an AOC uplink is performed

DESCRIPTION

This misbehavior may occur when all of the following conditions are satisfied:

- A SEC F-PLN is created by COPY ACTIVE or from an ATC uplink before the AOC uplink is loaded, and
- The MIN DEST FOB value of this SEC F-PLN is not the computed value by the FMS, and
- An AOC message is loaded:
  - Either in flight, or
  - On ground.

When an AOC flight plan uplink is loaded in the SEC F-PLN, the previous MIN DEST FOB value of the SEC F-PLN may not be clearable and fuel prediction computations are not consistent. The EXTRA fuel value displayed on the FMS FUEL PRED page may no longer be equal to the difference between the “Predicted DEST EFOB value” and the “MIN DEST FOB value”.

EXPLANATION

In the SEC Flight Plan:

When the AOC message is loaded with a new flight plan, the displayed MIN DEST FOB value of the SEC flight plan is not correct because the value applicable to the previous flight plan remains displayed.

In addition, this MIN DEST FOB value cannot be cleared.

The MIN DEST FOB value used by the FMS to perform the fuel computations (in particular for EXTRA fuel computation) is the default FMS computed value. Therefore, there is a difference between the displayed MIN DEST FOB value and the other fuel data (i.e. EXTRA differs from FOB at destination minus MIN DEST FOB).

In the Active Flight Plan:

If the uploaded SEC flight plan is activated, this abnormal behavior is transferred to the active flight plan. The MIN DEST FOB value cannot be cleared and the value that is displayed on the INIT B page or the FUEL PRED page is not correct and not consistent with the other fuel data that are correctly computed and displayed.

RECOMMENDATION

Subsequent to the uplink of a new SEC flight plan, the flight crew can detect this misbehavior if the EXTRA fuel value is no longer equal to the “Predicted DEST EFOB value minus MIN DEST FOB value”.

The flight crew cannot clear the MIN DEST FOB value. In order to continue, the flight crew should enter a MIN DEST FOB value again in the SEC flight plan to recover nominal fuel computations. To do this, the flight crew can perform one of the following:
- To obtain the FMS computed value, enter any value other than “CLR” then clear it, or
- Directly enter the desired MIN DEST FOB value.

Then, the flight crew can activate the SEC flight plan.

UNEXPECTED DECELERATE DISPLAYED ON MCDU (AND "T/D REACHED" ON PFD) DURING CLIMB

Ident.: DSC-22_20-100-30-00023137.0001001 / 04 JUN 19
Applicable to: MSN 04827-04860

DESCRIPTION

In some cases, both of the following spurious messages are simultaneously displayed:
- DECELERATE on the MCDU scratchpad
- T/D REACHED on the PFD.

The messages are displayed:
- During climb, or
- At acceleration altitude.

This misbehavior has no impact on the guidance of the aircraft.

OCCURRENCE CONDITIONS

This misbehavior occurs when, during cockpit preparation, all the following conditions apply:
- The FMS is fully initialized with predictions and FMS position is available, and
- A dual FMS reset (more than 5 s and less than 10 min) is performed and IRS are switched OFF, and
- FMS restarts while IRS are still OFF.

RECOMMENDATION

ON GROUND:

After FMS restart, enter any data in order to initiate a new profile computation (V2 speed, Cost Index, CRZ FL, ZFW, etc). This new profile computation restores normal FMS behavior.

IN FLIGHT:

During CLIMB or at acceleration altitude, disregard both of the following spurious messages: DECELERATE and T/D REACHED. Perform a DIR TO to the next waypoint, in order to force a new computation of the vertical path and restore normal FMS behavior.

MISSING OR INCORRECT INSERT UPLINK PROMPT ON UPLINK T.O DATA PAGE

Ident.: DSC-22_20-100-30-00023494.0001001 / 26 NOV 19
Applicable to: MSN 04827-04860

DESCRIPTION

This misbehavior may occur when all of the following conditions are satisfied:
- The flight crew sends a T.O DATA REQUEST on MCDU UPLINK TO DATA page
- The AOC uplink provides the T.O DATA for multiple runways. The T.O DATA are inserted for the DEPARTURE RWY in the active FMS F-PLN
- A SEC F-PLN is created by pressing COPY ACTIVE on the SEC INDEX page
- The DEPARTURE RWY is modified in the SEC F-PLN and SEC F-PLN is activated.

In such situation either of the following may occur:
- The INSERT UPLINK* prompt is displayed on all UPLINK TO DATA pages, or
- The INSERT UPLINK* prompt is only displayed on the UPLINK TO DATA page for previous DEPARTURE RWY.

OPERATIONAL RECOMMENDATION

Subsequent to an AOC T.O DATA REQUEST, the flight crew must crosscheck the T.O DATA to be inserted. The flight crew must check that the T.O DATA is consistent with the T.O RWY before they select the prompt INSERT UPLINK*.
If the prompt INSERT UPLINK* is not displayed on the UPLINK T.O DATA page of the selected T.O RWY (received by AOC), the flight crew must initiate a new T.O DATA REQUEST.

FMS RESET UPON CROSSING THE 180TH MERIDIAN

Ident.: DSC-22_20-100-30-00023697.0001001 / 26 NOV 19
Applicable to: MSN 04827-04860

DESCRIPTION

A single or a dual FMS reset with automatic recovery may occur when the aircraft crosses the 180th meridian (longitude 180 °).

- A reversion to basic modes (HDG/V/S or TRK/FPA) occurs if the FM1 (FM2) resets while AP1 (AP2) is engaged.

While the reset occurs:

- The ND of the resetting side displays “MAP NOT AVAIL”
- The FMS of the resetting side reverts to the MCDU MENU page
- The Autotuning of Navaids (VOR, DME, ADF ◁) is lost on the resetting side

OPERATIONAL RECOMMENDATION

In order to anticipate a possible FMS reset, the flight crew should monitor the crossing of the 180th meridian, using for example the FIX INFO page of the FMS.

DUAL FMS RESET WITH LOSS OF DATA UPON DIR TO/ABEAM INSERTION WITH 3 STEP ALTS

Ident.: DSC-22_20-100-30-00023710.0001001 / 26 NOV 19
Applicable to: MSN 04827-04860

DESCRIPTION

A dual FMS reset with automatic recovery may occur at DIR TO/ABEAM insertion when all the following conditions are met:
- The TO waypoint of the DIR TO/ABEAM does not belong to the flight plan
- There are at least 3 STEP ALTS defined in the flight plan
- The direct leg contains at least one waypoint with a STEP ALT.

The insertion is unsuccessful. After the reset, the DIR TO TMPY F-PLN remains displayed on FMS and ND.
If the DIR TO/ABEAM insertion is attempted 4 times within 3 min, all the FMS data are lost (*Refer to DSC-22_20-90-10 Automatic FMGC Reset and Resynchronization - Dual Reset with Loss of Data and Autorecovery*).

OPERATIONAL RECOMMENDATION

When there are 3 step altitudes in the STEP ALTS page of the FMS, do not use the DIR TO/ABEAM to a waypoint located outside of the flight plan. Instead, use the DIR TO or the DIR TO/INCPT.

The Flight Guidance (FG) provides the following functions:
- The Flight Director (FD)
- The Autopilot (AP)
- The Autothrust (A/THR).

The FG operates by using the following modes:
- AP/FD lateral modes to control the lateral trajectory
- AP/FD vertical modes to control the vertical trajectory, or the speed or Mach
- A/THR modes to control the speed or Mach, or the thrust.

Speed or Mach cannot be simultaneously controlled by the AP/FD and the A/THR.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-20-10-00025400.0001001 / 18 MAY 22
Applicable to: ALL

The FD displays guidance orders on the PFD:
- If no AP is engaged, the flight crew can manually fly the aircraft by following FD orders, or
- If at least one AP is engaged, the flight crew can use the FD to monitor the FG.

There are two FDs referred to as FD1 and FD2. In normal operation:
- PFD1 displays FD1 guidance orders, computed by FMGC1
- PFD2 displays FD2 guidance orders, computed by FMGC2.

Intentionally left blank

MANUAL ENGAGEMENT

Ident.: DSC-22_30-20-20-00025401.0001001 / 18 MAY 22
Applicable to: ALL

The flight crew manually engages the onside FD by pressing the onside FD pb.

Note: *If the flight crew did not previously engage any AP or FD, then HDG or TRK, and V/S or FPA engage. The FD symbol flashes for 10 s.*

AUTOMATIC ENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-20-20-A-00025402.0001001 / 18 MAY 22

ON GROUND

FD1 and FD2 automatically engage at aircraft power-up.

IN FLIGHT

FD1 and FD2 automatically engage in flight, if:
- The flight crew engages the SRS GA mode, or
- The AP/FD TCAS mode engages upon a RA.

Ident.: DSC-22_30-20-20-A-00025403.0001001 / 18 MAY 22

Note: *On SRS engagement, if the flight crew previously selected the FPV/FPD display, the FD symbol reverts to vertical and horizontal bars.*

ENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-20-20-00025404.0001001 / 18 MAY 22
Applicable to: ALL

If FD1 and/or FD2 engages, all the following events occur:
- The associated FD pb on the FCU comes on
- The xFDy message appears in the "AP, FD, A/THR Engagement Status" column of both FMAs.

Intentionally left blank

FD SYMBOLOGY - DISPLAY

Ident.: DSC-22_30-20-30-00025405.0001001 / 18 MAY 22
Applicable to: ALL

The pitch, roll, and yaw bars respectively indicate the pitch, roll, and yaw FD guidance orders.

Note: *Independently from FD display, the FPV can be displayed on the PFDs. The FPV does not indicate guidance orders.*
For definition and display conditions of the FPV, Refer to DSC-31-40 Flight Path Vector

When the FDs are engaged, the PFDs can display the pitch, roll, and yaw symbologies.
Refer to DSC-31-40 Guidance

DISPLAY CONDITIONS OF THE GUIDANCE SYMBOLOGY, WHEN THE FDS ARE ENGAGED:

FOR LATERAL GUIDANCE

The PFD displays the roll bar when a lateral mode is engaged.

The PFD displays a yaw bar that replaces the roll bar in green below 30 ft radio height if a localizer signal is available during:
- Takeoff in RWY mode, or
- Landing in FLARE and ROLL OUT modes.

FOR VERTICAL GUIDANCE

The PFD displays the pitch bar after liftoff, when a vertical mode is engaged.

IN FLIGHT, IN TRK-FPA MODE

The FPD replaces both FD bars.
The FPD symbol shows the flight crew how to intercept and fly the vertical and lateral flight trajectory.
For more information about the FPD, *Refer to DSC-31-40 Guidance*

Intentionally left blank

FD SYMBOLOGY - NON DISPLAY

Ident.: DSC-22_30-20-40-00025406.0001001 / 18 MAY 22
Applicable to: ALL

If the FDs are not engaged, the PFDs do not display the FD symbology.

The FD bars disappear, when one of the following occurs:
- The aircraft bank angle exceeds 45 °, or
- The aircraft pitch exceeds 25 ° up or 13 ° down.

The pitch bar disappears in ROLL OUT.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-20-50-00025359.0001001 / 18 MAY 22
Applicable to: ALL

If all FDs disengage while no AP is engaged, all the following occur:
- The lateral and vertical modes disengage, and
- If engaged, the A/THR reverts to (or remains in) SPEED or MACH mode.

If all FDs disengage while at least one AP is engaged, all the following occur:
- The lateral and vertical modes remain engaged, and
- If engaged, the A/THR remains engaged in the current mode.

MANUAL DISENGAGEMENT

Ident.: DSC-22_30-20-50-00025360.0001001 / 18 MAY 22
Applicable to: ALL

The flight crew can manually press the onside FD pb to disengage the onside FD.

AUTOMATIC DISENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-20-50-A-00025361.0001001 / 18 MAY 22

The FD disengages if, in ROLL OUT, the difference between the aircraft track and the runway track is more than 20 °.

DUE TO FAILURES

The FD disengages if one of the following occurs:
- The FD becomes inoperative, or
- The FCU is not available, or
- All the engines fail.

Ident.: DSC-22_30-20-50-A-00025362.0001001 / 18 MAY 22

DUE TO SPEED PROTECTION

The FD disengages if no AP is engaged and the aircraft speed is either:
- below VLS in DES or OP DES, or
- above VMAX in CLB or OP CLB.

Note: *After the FD disengages, the A/THR reverts to SPEED or MACH mode and adjusts the thrust to recover the target speed or keep the speed within the range from VLS to VMAX, if the target speed is out of this range.*

DISENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-20-50-00025363.0001001 / 18 MAY 22
Applicable to: ALL

If the flight crew disengages one FD, all the following occur:
- The corresponding FD pb goes off,
- The FD symbol no longer appears on the associated PFD,
- 1FD- appears on the FMA if FD2 is disengaged or -FD2 if FD1 is disengaged.

If one FD fails, all the following occur:
- All FD pb remain on,
- Both PFDs display the guidance orders from the remaining FD,
- 1FD1 appears on the FMA if FD2 fails, or 2FD2 if FD1 fails.

FD BARS FLASHING

Ident.: DSC-22_30-20-60-00025365.0001001 / 18 MAY 22
Applicable to: ALL

PITCH BAR

The pitch bar (or FPV) flashes for 10 s and remains steady, if one of the following occurs:
- An automatic reversion to V/S (or FPA) mode occurs, or
- All APs and FDs are previously disengaged and the flight crew engages the FD.

The pitch bar (or FPV) flashes, if, during approach, the MMR is not able to compute the vertical deviation above 100 ft RA.

ROLL BAR

The roll bar (or FPV) flashes for 10 s and remains steady, if one of the following occurs:
- An automatic reversion to HDG (or TRK) mode occurs, or
- All APs and FDs are previously disengaged and the flight crew engages the FD.

The roll bar (or FPV) flashes if, during approach, the MMR is not able to compute the lateral deviation above 15 ft RA.

FD FLAG

Ident.: DSC-22_30-20-60-00025366.0001001 / 18 MAY 22
Applicable to: ALL

If the guidance orders are not available while the FD is engaged, a FD flag appears on the PFD and the FD bars disappear.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-30-10-00025195.0001001 / 18 MAY 22
Applicable to: ALL

The AP:
- Stabilizes the aircraft around its center of gravity
- Controls the lateral trajectory
- Controls the vertical trajectory, or speed/Mach
- Coordinates with the A/THR
- Performs the automatic landing, or the go-around.

The AP generates:
- Pitch, roll, and yaw orders
- The nosewheel angle.

There are two APs: AP1 and AP2.
AP1 uses system data displayed on PFD1, and AP2 uses system data displayed on PFD2.

Intentionally left blank

INTRODUCTION

Ident.: DSC-22_30-30-20-00025196.0001001 / 18 MAY 22
Applicable to: ALL

When an AP engages, the sidesticks are locked in the neutral position, and the force to move the rudder pedals increases. However, the flight crew can always disengage the APs and the locking devices.
The APs engage with the same guidance mode previously used by the FD.
If the FDs were not previously engaged, the AP engages in HDG or TRK, and V/S or FPA.
L2 The APs are available in normal and alternate law, only.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-30-20-A-00025197.0001001 / 18 MAY 22

ENGAGEMENT OF ONE AP

One AP engages when the flight crew presses the AP1 pb or the AP2 pb on the FCU, and the aircraft is in flight for more than 5 s.
In BACK-UP NAV, the AP engages in selected modes if the FG part is available.
The AP engages only if the aircraft pitch, bank angle, and speed are within an acceptable range.

Ident.: DSC-22_30-30-20-A-00025198.0001001 / 18 MAY 22

ENGAGEMENT OF BOTH APS

When one AP is engaged, the flight crew can press the second AP pb to engage the second AP.

However, the second AP can engage only when one of the following conditions is applicable:
- LOC is armed, or LOC* or LOC is engaged, and
- G/S is armed, or G/S* or G/S is engaged
- Go-around is engaged.

When both APs are engaged, AP1 is active, and AP2 is on standby, regardless of the order of AP engagement.

ENGAGEMENT ANNUNCIATION

Ident.: DSC-22_30-30-20-00025199.0001001 / 18 MAY 22
Applicable to: ALL

When AP1(2) engages, all the following events occur:

- The associated AP1(2) pb on the FCU comes on
- Both FMAs display:
  - AP1 (AP2)
  - AP1+2, if both APs are engaged.

MANUAL DISENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-30-30-A-00025200.0001001 / 18 MAY 22

The APs disengages if one of the following occurs:

- The flight crew presses the takeover pb on the sidestick, or
- The flight crew presses the AP1(2) pb on the FCU, or
- The flight crew moves the pitch trim wheel beyond a certain threshold, or
- The flight crew moves a sidestick above a specific threshold, or

Ident.: DSC-22_30-30-30-A-00025201.0001001 / 18 MAY 22

- The flight crew moves the rudder pedals above a specific threshold, or

Ident.: DSC-22_30-30-30-A-00025202.0001001 / 18 MAY 22

- On ground, the flight crew sets all the thrust levers above the MCT detent.

Airbus recommends to press the sidestick pb two times to disengage both APs.
L2 One time to disengage the APs, the second time to clear the associated AP OFF alert.
L1 The other ways of disengagement are to be avoided. In particular, the disengagement of the APs with the sidestick, or the rudder pedal deflection is very uncomfortable for passengers.

AUTOMATIC DISENGAGEMENT

Applicable to: ALL

Ident.: DSC-22_30-30-30-B-00025203.0001001 / 18 MAY 22

The APs automatically disengage, if one of the following occurs:

- One of the engagement conditions is lost, or

Ident.: DSC-22_30-30-30-B-00025204.0001001 / 18 MAY 22

- During an approach with FINAL APP mode engaged, the aircraft reaches:
  - The MAP, or
  - The MDA/MDH -50 ft (if entered), or 400 ft AGL (if no MDA/MDH is entered).

Ident.: DSC-22_30-30-30-B-00025205.0001001 / 18 MAY 22

In addition, in normal law with all protections available, the APs will disengage when:

- High speed protection activates, or
- Angle-of-attack protection activates, or
- Pitch attitude exceeds 25 ° up, or 13 ° down, or bank angle exceeds 45 °.

When the AP is OFF, the associated FCU pb goes off, and AP1 (AP2) disappears from the FMA.

DISENGAGEMENT ANNUNCIATIONS AND WARNINGS

Ident.: DSC-22_30-30-30-00025206.0001001 / 18 MAY 22
Applicable to: ALL

When AP1(2) disengages, all the following events occur:
- The associated AP1(2) pb on the FCU goes off
- On both FMAs, the AP1(AP2) message disappears.

DISCONNECTION VIA THE takeover pb

The normal way to disconnect the AP is to press the takeover pb two times.

When the flight crew presses the takeover pb for the first time, the following warnings are triggered, and will continue, until the flight crew presses the takeover pb a second time:
- The AP OFF memo appears on the PFDs and on the WD
- A cavalry charge audio indicator sounds, at low volume
- The MASTER WARN light comes on.

When the flight crew presses the takeover pb the second time or the MASTER WARN light, all the above warnings are cleared.

If the flight crew does not quickly press the takeover pb a second time, the following additional warnings will trigger:
- The cavalry charge audio indicators sounds, at high volume
- The AUTO FLT AP OFF alert is displayed on the WD.

When the flight crew presses the MASTER WARN light, or the takeover pb a second time, the cavalry charge audio indicator stops and the memos disappear, but the AUTO FLT AP OFF remains displayed.

OTHER WAYS OF DISCONNECTION

If the AP disengages, without any flight crew action on the takeover pb, the following warnings will trigger:
- The AP OFF memo appears on the PFDs
- A cavalry charge audio indicator sounds, at high volume
- The AUTO FLT AP OFF alert is displayed on the WD.

When the flight crew presses the MASTER WARN light, or the takeover pb (one time), the cavalry charge stops and the memo disappears, but the alert remains displayed.

INTRODUCTION

Ident.: DSC-22_30-40-10-00025207.0001001 / 18 MAY 22
Applicable to: ALL

The AP/FD modes are either lateral, vertical, or common.

Two types of AP/FD modes are available in order to guide the aircraft:
- Managed modes: when the aircraft is using managed targets, the FMGS guides the aircraft along lateral and vertical flight paths and speed profiles computed by the FM from data in the MCDU. FM manages the guidance targets.
- Selected modes: when the flight crew is using selected targets, the FMGS guides the aircraft along lateral and vertical flight paths and speed profiles to meet targets that the flight crew has selected manually on the FCU. The flight crew selects the guidance targets.

AP/FD LATERAL MODES

Applicable to: ALL

MODE	TYPE	GUIDANCE	REMARK
Ident.: DSC-22_30-40-10-A-00025212.0001001 / 18 MAY 22			
RWY	MANAGED	Runway mode Mode used at takeoff to guide the aircraft along the runway center line using LOC.	Triggered by the thrust levers at FLX or TOGA position.
RWY TRK	MANAGED	Runway Track mode Mode used to guide the aircraft along the track the aircraft was following at the mode engagement.	
HDG,TRK	SELECTED	Heading mode, Track mode Mode used to guide the aircraft on a heading or a track selected by the flight crew. The target value is displayed in the FCU window.	*Note:* *HDG,TRK are called "basic modes" because it is a back up mode for certain situations :* - *F-PLN discontinuity entry* - *AP engagement with no FD* - *Loss of F-PLN* - *MCDU BACK UP NAV* ◁ .
NAV	MANAGED	Navigation mode Mode used to guide the aircraft along the lateral F-PLN. Available above 30 ft after takeoff.	Automatically armed at takeoff unless HDG,TRK is preset. In that case RWY TRK engages after takeoff.
LOC* **LOC**	MANAGED	Localizer capture mode Localizer track mode Mode used to guide the aircraft on the lateral approach path (LOC approach path).	Selected by pressing APPR pb on the FCU.
F-LOC* ◁ **F-LOC** ◁	MANAGED	Flight Management Landing System Localizer capture mode Flight Management Landing System Localizer track mode Mode used to guide the aircraft on the lateral approach path (F-PLN approach path).	Selected by pressing APPR pb on the FCU.
LOC B/C* ◁ **LOC B/C** ◁	MANAGED	Localizer Back Course capture mode Localizer Back Course track mode Mode used to guide the aircraft on the back beam of a localizer.	Selected by LAT REV at destination. Activated by pressing the LOC pb on the FCU.
GA TRK	MANAGED	Go-Around track mode Mode used to guide the aircraft along the track the aircraft was following at the mode engagement.	Triggered by the thrust levers at TOGA with Slats/Flaps in at least CONF 1.

Continued on the following page

Continued from the previous page

MODE	TYPE	GUIDANCE	REMARK
Ident.: DSC-22_30-40-10-A-00025215.0001001 / 18 MAY 22			
APP NAV	MANAGED	Approach Nav mode Mode used to guide the aircraft on the lateral approach path.	Selected by pressing APPR pb on the FCU; the mode that engages depends upon the selected approach in the F-PLN.

AP/FD VERTICAL MODES

Applicable to: ALL

Ident.: DSC-22_30-40-10-B-00025217.0001001 / 18 MAY 22

MODE	TYPE	GUIDANCE	REMARK
SRS	MANAGED	Speed Reference System mode Mode used at takeoff, or go-around to maintain SRS speed (V2, V2+10, VAPP...).	Triggered by the thrust levers at FLX or TOGA position. Automatically disengages at ACCEL ALT, or when another VERT mode is engaged.
OP CLB	SELECTED	Open Climb mode mode Mode used to climb directly to the FCU selected altitude. These modes disregard all ALT CST. The A/THR is in THRUST mode (CLB/IDLE)	The speed target may either be selected or managed. ALT mode is systematically armed. Altitude target is blue on the PFD.
CLB	MANAGED	Climb mode Mode used to climb towards FCU selected altitude along VERT F-PLN taking into account ALT CST. Available, only if NAV mode engaged. The A/THR is in THRUST mode (CLB).	The speed target may either be selected or managed. If managed, SPD CST, SPD LIM, and HOLD SPD are taken into account. ALT mode is always armed, and the FMA displays: - ALT CST if the next level off is predicted at an ALT CST, or - ALT if the next level off is predicted at the FCU selected altitude.
EXP CLB ◁✳	SELECTED	This mode is used to increase the vertical speed by selecting Green Dot speed in climb.	Used to expedite a climb towards a specific flight level.
ALT* **ALT**	SELECTED	Altitude acquire mode Altitude hold mode Mode used to maintain a level flight at the FCU selected altitude.	
ALT CST* **ALT CST**	MANAGED	Altitude Constraint capture mode Altitude Constraint hold mode Mode automatically engaged when reaching an ALT CST before the FCU selected altitude.	CLB/DES mode are systematically armed.
ALT CRZ* **ALT CRZ**	SELECTED	Altitude capture of the cruise flight level Altitude hold of the cruise flight level Mode used to maintain the cruise level flight.	Soft ALT mode engages when FCU selected altitude = CRZ FL. Soft ALT mode is part of the managed guidance.

Continued on the following page

Continued from the previous page

MODE	TYPE	GUIDANCE	REMARK
OP DES	SELECTED	Open Descent mode Mode used to descend directly to the FCU selected altitude. These modes disregard all ALT CST. The A/THR is in THRUST mode (CLB/IDLE)	The speed target may either be selected or managed. ALT mode is systematically armed. Altitude target is blue on the PFD.
DES	MANAGED	Descent mode Mode used to descend towards FCU selected altitude along the computed descent path, taking into account ALT CST. Available, only if NAV mode engaged. The A/THR may be in THRUST, or SPD mode.	The speed target may either be selected or managed. If managed, SPD CST, SPD LIM, and HOLD SPD are taken into account. ALT mode is always armed, and the FMA displays: - ALT CSTif the next level off is predicted at an ALT CST, or - ALT if the next level off is predicted at the FCU selected altitude.
EXP DES ◁ ,	SELECTED	This mode is used to increase the vertical speed by selecting 0.80/340 kt in descent.	Used to expedite a descent towards a specific flight level.
V/S, FPA	SELECTED	Vertical Speed mode, Flight Path Angle mode Mode used to guide the aircraft by a vertical speed, or a selected flight path angle.	Altitude target is blue on PFD. V/S-FPA is a basic mode.
G/S* **G/S**	MANAGED	Glide Slope capture mode Glide Slope track mode Mode used to guide the aircraft along the final approach path (ILS/GLS ◁ /SLS ◁ (RNAV(GNSS) approach with LPV minima guidance mode)	Selected by pressing APPR pb on the FCU.
F-G/S* ◁ **F-G/S** ◁	MANAGED	Flight Landing System Glide Slope capture mode Flight Landing System Glide Slope track mode Mode used to guide the aircraft along the final approach path (FLS ◁ approach)	Selected by pressing APPR pb on the FCU.

Continued on the following page

Continued from the previous page

Ident.: DSC-22_30-40-10-B-00025224.0001001 / 18 MAY 22

MODE	TYPE	GUIDANCE	REMARK
FINAL	MANAGED	Final mode Mode used to guide the aircraft along the final approach path (non precision approach)	Selected by pressing the FCU's APPR pb. The mode engaged depends upon the selected approach in the F-PLN. Linked to APPR common mode (APPR pb).

Ident.: DSC-22_30-40-10-B-00025225.0001001 / 18 MAY 22

AP/FD TCAS ◁✱	MANAGED	Mode used to guide the A/C in the case of TCAS RA	Automatically engaged when a RA is triggered.

AP/FD COMMON MODES

Applicable to: ALL

MODE	TYPE	GUIDANCE	REMARK
Ident.: DSC-22_30-40-10-C-00025227.0001001 / 18 MAY 22			
LAND	MANAGED	Land mode Common mode engaged below 400 ft RA during an automatic ILS/GLS /SLS (RNAV(GNSS) approach with LPV minima guidance mode) approach.	Engaged only if LOC mode and G/S mode are already engaged.
FLARE	MANAGED	Flare mode Common mode which provides alignment to the runway centerline on the yaw axis, and flare on the pitch axis.	Engaged below 60 ft RA, based on the current vertical speed.
ROLL OUT	MANAGED	Roll Out mode Mode used to guide the aircraft on the runway following an automatic landing.	FD roll out symbol is displayed on PFD at touch down.
Ident.: DSC-22_30-40-10-C-00025237.0001001 / 18 MAY 22			
FINAL APP	MANAGED	Final Approach mode Common mode including APP NAV and FINAL modes during non-precision approach.	Engaged only if APP- NAV mode and FINAL mode are already armed.

AP/FD MODE STATUS AND DISPLAY

Ident.: DSC-22_30-40-10-00025226.0001001 / 18 MAY 22
Applicable to: ALL

AP/FD MODE STATUS

An AP/FD lateral or vertical mode can be armed, engaged, or disengaged.
An AP/FD common mode can either be engaged or disengaged.
When all APs and FDs disengage, all AP/FD modes disengage.

AP/FD MODE DISPLAY

The FMA displays the AP/FD modes (*Refer to DSC-22_30-80-20 FMA Display*).

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-20-10-00025902.0001001 / 18 MAY 22
Applicable to: ALL

At takeoff, SRS vertical mode, and RWY lateral mode simultaneously engage. They disengage at different moment.
In some cases, when airborne, RWY mode can change to another lateral takeoff mode such as RWY TRK mode.

Intentionally left blank

SRS TO Mode

GENERAL

Ident.: DSC-22_30-40-20-20-A-00025335.0001001 / 18 MAY 22
Applicable to: ALL

The SRS mode is a managed vertical mode, used during takeoff and during go-around.
This chapter only describes the SRS mode during takeoff, also referred to as the SRS TO mode. The FMA announces the SRS TO mode with the SRS indication.
The SRS TO controls the speed via the elevators, in order to steer the aircraft along a vertical path.

The guidance law also includes:
- A flight path angle protection, that ensures a minimum vertical speed of 120 ft/min

1 Ident.: DSC-22_30-40-20-20-A-00025341.0002001 / 18 MAY 22
Applicable to: MSN 11531

- A pitch angle protection to reduce the aircraft nose-up (15 ° of maximum pitch attitude or 22.5 ° maximum in case of windshear).

Ident.: DSC-22_30-40-20-20-A-00025341.0001001 / 18 MAY 22
2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

- A pitch angle protection to reduce the aircraft nose-up (18 ° of maximum pitch attitude or 22.5 ° maximum in case of windshear).

Ident.: DSC-22_30-40-20-20-A-00025342.0001001 / 18 MAY 22
Applicable to: ALL

- A speed protection limiting the target speed to V2+15 kt.

Ident.: DSC-22_30-40-20-20-A-00025344.0001001 / 18 MAY 22
Applicable to: ALL

When the aircraft is on ground, V2 is the speed target.
When the aircraft is airborne, V2+10 kt becomes the speed target.
If one engine fails, the speed target is the current aircraft speed at the engine failure detection.
However, the speed target is limited by V2 and V2+15 kt.
For more information on the speed target, *Refer to DSC-22_20-60-40 Flight Guidance Part*.
For more information on the speed target, *Refer to DSC-22_30-60-20 General*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-20-00025337.0001001 / 18 MAY 22
Applicable to: ALL

SRS TO engages, when all of the following conditions are applicable:

- The aircraft is on ground
- The slats or the flaps are extended
- V2 is inserted in the PERF TAKEOFF page

L2 If V2 has not been inserted, V/S mode engages 5 s after lift-off on the current V/S value.

L1
- The flight crew sets at least one thrust lever:
  - To the TOGA detent, or
  - To the FLX-MCT detent, when a FLX TO temperature or a Derated Takeoff is entered in the PERF TAKEOFF page.

Note: *When V2 is inserted, or SRS TO is engaged, the speed automatically becomes managed. For more information about engagement conditions of managed speed, Refer to DSC-22_30-60-20 Engagement Conditions.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-20-20-B-00025338.0001001 / 18 MAY 22

SRS TO mode disengages, when one of the following occurs:

- Automatically, at the GA ACCEL ALT, or if ALT* or ALT CST* mode engages (above 400 ft RA), or
- Another vertical mode engages.

Note: *In Engine Out conditions, the SRS mode does not automatically disengage at EO ACCEL ALT.*

Ident.: DSC-22_30-40-20-20-B-00025339.0001001 / 18 MAY 22

REVERSIONS

SRS TO reverts to OP CLB, when the FCU selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.

Ident.: DSC-22_30-40-20-20-B-00025340.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

RWY Mode

GENERAL

Ident.: DSC-22_30-40-20-30-00025240.0001001 / 18 MAY 22
Applicable to: ALL

The RWY mode is a managed lateral mode.
When the LOC signal is available, the RWY mode gives lateral guidance orders during takeoff, and initial climb.

L2 The RWY guidance law aims to maintain the aircraft on the runway centerline during the takeoff run.
When the aircraft is airborne, the RWY guidance law aims to maintain the sideslip indicator centered.
To follow the guidance, the FD displays the conventional guidance bar.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-30-00025241.0001001 / 18 MAY 22
Applicable to: ALL

RWY engages, if all of the following conditions are applicable:

- L2 V2 is inserted in the PERF TAKEOFF page, and
- The aircraft is on ground, and
- The slats are extended, and
- The LOC is valid, and
- The LOC deviation is below 1/2 dot, and
- The aircraft heading is within 20 ° of the ILS (GLS ◁✳) (SLS ◁✳) course, and
- An ILS (GLS ◁✳)(SLS ◁✳) is set, associated to the takeoff runway, and the difference between the LS course and the runway heading, as inserted in the flight plan is less than 2 °, and
- No lateral mode is already engaged, and
- L1 The flight crew sets a thrust lever to:
  - The TOGA detent, if TOGA is selected on the PERF TAKEOFF page, or
  - The FLX-MCT detent, if a FLX TO temperature or a Derated Takeoff ◁✳ level is entered on the PERF TAKEOFF page.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-30-00025242.0001001 / 18 MAY 22
Applicable to: ALL

RWY disengages, when one of the following occurs:

- The LOC is lost below 30 ft RA
- NAV is armed, and the aircraft reaches 30 ft RA: NAV engages
- L2 NAV is not armed, and the aircraft reaches 50 ft RA: RWY TRK engages

L1 - Another lateral mode engages

L2 - The aircraft heading deviates from more than 20 ° from the ILS (GLS ◁)(SLS ◁) course.

RWY TRK Mode

GENERAL

Ident.: DSC-22_30-40-20-40-00025243.0001001 / 18 MAY 22
Applicable to: ALL

RWY TRK mode is a managed lateral mode.
The RWY TRK mode guides the aircraft along a constant track target. The track target is the aircraft track at RWY TRK engagement.

L2 To follow the guidance, the FD displays the conventional guidance bar.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-40-00025244.0001001 / 18 MAY 22
Applicable to: ALL

The RWY TRK automatically engages at 30 ft RA, if all of the following conditions are applicable:
- The FMS flight phase is takeoff, and
- NAV is not engaged.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-20-40-00025245.0001001 / 18 MAY 22
Applicable to: ALL

RWY TRK disengages, when one of the following occurs:
- The flight crew pulls the HDG/TRK knob: HDG/TRK engages
- NAV is armed, and the aircraft reaches the capture zone of the active leg: NAV engages
- The flight crew inserts a DIRECT TO waypoint: NAV engages.

Intentionally left blank

HDG/TRK Mode

GENERAL

Ident.: DSC-22_30-40-30-10-00025898.0001001 / 18 MAY 22
Applicable to: ALL

HDG and TRK are selected lateral modes. They are the basic modes of lateral guidance.
HDG/TRK guides the aircraft laterally along the heading/track target, that appears in the HDG/TRK window on the FCU. For more information on the HDG/TRK window, *Refer to DSC-22_10-40-20 Lateral Control Area*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-10-A-00025881.0001001 / 18 MAY 22
Applicable to: ALL

HDG or TRK engages when one of the following conditions occurs:

Ident.: DSC-22_30-40-30-10-A-00025882.0001001 / 18 MAY 22
Applicable to: ALL

- The flight crew pulls the HDG/TRK knob on the FCU in flight, or

L2 This is applicable if:
- The aircraft is in flight, for at least 5 s after liftoff, or
- Not in LAND, FLARE, or ROLL OUT, or
- Not in GA TRK below 100 ft RA.

Ident.: DSC-22_30-40-30-10-A-00025883.0001001 / 18 MAY 22
Applicable to: ALL

- NAV is engaged and the flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT, or

Ident.: DSC-22_30-40-30-10-A-00025884.0001001 / 18 MAY 22
Applicable to: ALL

- FINAL mode (armed or engaged) is lost when the aircraft is in APP NAV mode, or

Ident.: DSC-22_30-40-30-10-A-00025885.0001001 / 18 MAY 22
Applicable to: ALL

- All AP and FDs were previously off, and the flight crew engages the AP or the FDs

Note: *1. The AP or FDs engage in basic modes: HDG or TRK, and V/S or FPA.*
2. If the FD engages, the FD bars flash for 10 s.

Ident.: DSC-22_30-40-30-10-A-00025886.0001001 / 18 MAY 22
Applicable to: ALL

- LOC mode is armed when FINAL APP was previously engaged, or

Ident.: DSC-22_30-40-30-10-A-00025887.0001001 / 18 MAY 22
1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

- The flight crew presses the APPR pb (above 400 ft) or the LOC pb to off, when the approach is armed, or

Ident.: DSC-22_30-40-30-10-A-00025888.0001001 / 18 MAY 22
Applicable to: ALL

- LOC*, LOC, LOC B/C* ◁ , LOC B/C ◁ , F-LOC* ◁ or F-LOC ◁ is engaged in a LOC only approach, and the flight crew presses the LOC pb to off.

Ident.: DSC-22_30-40-30-10-A-00025889.0001001 / 18 MAY 22
Applicable to: ALL

REVERSIONS TO HDG/TRK

The HDG/TRK also engages when one of the following reversion occurs:

- NAV disengages:
  - The aircraft reaches a flight plan discontinuity
  - The NAV mode fails.
- The approach is modified in the flight plan, when LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , or LOC B/C ◁ is engaged
- LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , or LOC B/C ◁ is lost after a failure occurs in approach.
  All AP(s) disengage. The FDs reverts to HDG or TRK and V/S or FPA.

Note: *If a managed vertical mode was previously engaged, a selected vertical mode engages:*
- *If CLB was engaged, OP CLB engages*
- *If ALT CST*, ALT CRZ*, or DES was engaged, V/S/FPA engages*
- *If ALT CST was engaged, ALT engages.*

Ident.: DSC-22_30-40-30-10-A-00025890.0001001 / 18 MAY 22
Applicable to: ALL

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

HDG-V/S / TRK-FPA SELECTION

Ident.: DSC-22_30-40-30-10-00025891.0001001 / 18 MAY 22
Applicable to: ALL

The flight crew can press the HDG-V/S / TRK-FPA pb on the FCU to change from one selection to another.
At the aircraft power-up, the HDG-V/S / TRK-FPA selection is set to HDG-V/S by default.

When HDG-V/S is selected:
- HDG appears on the HDG/TRK window of the FCU
- V/S appears on the V/S / FPA window of the FCU
- HDG and/or V/S mode(s) can be engaged
- TRK and FPA modes cannot be engaged.

When TRK-FPA is selected:
- TRK appears on the HDG/TRK window of the FCU
- FPA appears on the V/S / FPA window of the FCU
- HDG and V/S mode(s) cannot be engaged
- TRK and/or FPA modes can be engaged
- Both PFDs display the FPV in green.

HDG/TRK PRESET

Ident.: DSC-22_30-40-30-10-B-00025892.0001001 / 18 MAY 22
Applicable to: ALL

GENERAL

The system has a HDG/TRK preset function for takeoff and go-around.
If the flight crew decides not to fly the flight plan after takeoff or go-around, the flight crew can turn the HDG/TRK knob on the FCU to preset a heading or a track. The set value remains displayed in the FCU HDG/TRK window until the flight crew pulls the knob.

AT TAKEOFF

If the flight crew presets the HDG/TRK before takeoff and up to 30 ft RA, NAV disarms. The preset value remains displayed in the HDG/TRK window (even when RWY TRK engages at 50 ft RA).
When the flight crew pulls the HDG/TRK knob (at least 5 s after liftoff), HDG or TRK mode engages.
The aircraft follows the preset target.

Ident.: DSC-22_30-40-30-10-B-00025893.0002001 / 18 MAY 22
Applicable to: ALL

AT GO-AROUND

If the flight crew presets the HDG/TRK when LOC*, LOC, LOC B/C, LOC B/C*, F-LOC* ◁* , F-LOC ◁* , LAND, FLARE, ROLL OUT or GA TRK mode is engaged, the preset value remains displayed in the HDG/TRK window, as long as one of theses modes is engaged.
After go-around engagement, HDG/TRK will engage, when the flight crew pulls the HDG/TRK knob.
When the HDG or TRK engages, the heading/track target is the HDG/TRK preset.

Ident.: DSC-22_30-40-30-10-B-00025894.0001001 / 18 MAY 22
2 **Applicable to: MSN 01143-01251, 01459-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

When overflying the MAP, HDG/TRK will synchronize with the current aircraft heading / track. The HDG/TRK preset function is no longer available.

Ident.: DSC-22_30-40-30-10-B-00025895.0001001 / 18 MAY 22
Applicable to: ALL

CANCELLATION

The flight crew can cancel a HDG/TRK preset with one of the following action:
- The HDG/TRK knob is pushed, or
- A DIR TO is selected in the FMS, or
- The AP and FDs are disengaged.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-10-00025896.0001001 / 18 MAY 22
Applicable to: ALL

The engagement of any other lateral mode disengages HDG or TRK.

SYNCHRONIZE THE HDG/TRK WINDOW OF THE FCU

Ident.: DSC-22_30-40-30-10-00025897.0001001 / 18 MAY 22
Applicable to: ALL

The lateral window of the FCU displays heading or a track value when:
- The HDG/TRK mode is engaged. The displayed value is the current HDG/TRK or the manually selected value of the target
- The flight crew turns the HDG/TRK knob. The value in the window first synchronizes with the current HDG/TRK, then displays the manual selection. It remains displayed for 10 s or 45 sdepending upon FCU standard, then vanishes if the flight crew does not pull the knob (except in HDG preset)

- A HDG/TRK is preset
- AP/FD is lost. The value becomes that of the aircraft current heading or track.

Note: *If HDG is switched to TRK (or vice versa), the value displayed in the window switches from heading to track (or vice versa).*

Intentionally left blank

NAV Mode

GENERAL

Ident.: DSC-22_30-40-30-20-00025463.0001001 / 18 MAY 22
Applicable to: ALL

The NAV mode is a managed lateral mode, that guides the aircraft laterally along the FMS flight plan. It is designed to have a zero crosstrack error. NAV usually arms before engaging.

ARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00025464.0002001 / 18 MAY 22
1 **Applicable to: MSN 01143-01251, 01459-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

For NAV arming, the lateral flight plan must be available.

NAV arms, when one of the following occurs:
- The aircraft is on ground, and the flight crew does not preset a HDG/TRK for takeoff, or
- The flight crew pushes the HDG/TRK knob on the FCU, or
- The flight crew activates a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT when in HDG/TRK mode, or
- The flight crew presses the APPR pb and the conditions to arm the FINAL APP mode are applicable, or
- The flight crew initiates a go-around.

L2 This is not applicable if HDG/ TRK is preset.

L1 However, NAV cannot arm, if one of the following modes is engaged: LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁ , LAND, FLARE, ROLL OUT.

ARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00025464.0001001 / 18 MAY 22
Applicable to: MSN 01376

For NAV arming, the lateral flight plan must be available.

NAV arms, when one of the following occurs:
- The aircraft is on ground, and the flight crew does not preset a HDG/TRK for takeoff, or
- The flight crew pushes the HDG/TRK knob on the FCU, or
- The flight crew activates a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT when in HDG or TRK mode, or
- The flight crew presses the APPR pb and the conditions to arm the FINAL APP mode are applicable.

However, NAV cannot arm, if one of the following modes is engaged: LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁ , LAND, FLARE, ROLL OUT.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00025465.0001001 / 18 MAY 22
Applicable to: MSN 01376

NAV mode disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff, or go-around, or
- NAV mode engages, or
- The flight crew pulls out the HDG/TRK knob, or
- The flight crew arms or engages an approach mode, except if the APP NAV can be armed, or
- The flight crew engages a go-around, or
- LAND mode engages.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-30-20-00025465.0003001 / 18 MAY 22
2 **Applicable to: MSN 01143-01251, 01459-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

NAV mode disarms, when one of the following occurs:
- The flight crew presets a HDG/TRK for takeoff, or go-around, or
- NAV mode engages, or
- The flight crew pulls out the HDG/TRK knob, or
- The flight crew arms or engages an approach mode, except if the APP NAV can be armed, or
- LAND mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-30-20-00025466.0001001 / 18 MAY 22
Applicable to: MSN 01376

For NAV engagement, the lateral flight plan must be available.

NAV engages, if one of the following occurs:
- NAV is armed, and the aircraft reaches 30 ft RA after takeoff, or
- NAV is armed, and the aircraft reaches the capture zone of the flight plan active leg, or
- The flight crew activates a DIR TO on the MCDU, or

L2 This is not applicable, if LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁ , LAND, FLARE, ROLL OUT is engaged below 700 ft RA.

L1 - The flight crew selects the HDG/TRK when the aircraft is close to (within ~1 NM of) the active flight plan leg.

When NAV is engaged, the HDG/TRK window on the FCU displays dashes.

CAPTURE ZONE OF THE FLIGHT PLAN ACTIVE LEG

When NAV is armed, it automatically engages, if:

- The aircraft track line intercepts the flight plan between the FROM and the TO waypoints, and
- The intercept waypoint (INTCPT) is displayed on the ND, and
- The aircraft reaches the capture zone of the flight plan active leg.

The following is an example:

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-30-20-A-00025467.0001001 / 18 MAY 22

NAV disengages, when HDG, TRK, LOC *, F-LOC * ◁ , LOC B/C * ◁ , or GA TRK engages.

REVERSIONS

NAV disengages, and reverts to the HDG/TRK mode when:
- The aircraft reaches a flight plan discontinuity
- The flight plan becomes invalid.

Note: *When the lateral mode reverts to HDG/TRK, the vertical mode also reverts to a vertical selected mode.*

For more information about the reversion to HDG/TRK, *Refer to DSC-22_30-40-30-10 Engagement Conditions 1*.

Ident.: DSC-22_30-40-30-20-A-00025468.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

INTERACTIONS WITH VERTICAL MODES

Ident.: DSC-22_30-40-30-20-00025469.0001001 / 18 MAY 22
Applicable to: ALL

When NAV is engaged with the managed vertical modes CLB or DES or FINAL APP, the guidance takes into account the altitude and speed constraints, linked to waypoints on the lateral flight plan. When NAV disengages, the managed vertical modes are not available and the altitude constraints are disregarded.

Intentionally left blank

OP CLB Mode

GENERAL

Ident.: DSC-22_30-40-40-10-00025470.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB mode is a selected vertical mode.
OP CLB guides the aircraft vertically to the FCU selected altitude. All altitude constraints are disregarded.

When OP CLB is engaged:
- OP CLB controls the speed/Mach target (selected or managed)
- If the A/THR is active, the A/THR will control the thrust.

OP CLB usually arms before it engages.

ARMING CONDITIONS

Ident.: DSC-22_30-40-40-10-00025471.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB arms, when all of the following conditions are applicable:
- The aircraft is on ground, or SRS is engaged (TO or GA), and
- NAV is neither armed nor engaged, or the vertical flight plan is not available, and
- The ACCEL altitude is available and below the FCU selected altitude.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-40-10-00025472.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB disarms, when one of the following occurs:
- V/S/FPA or OP CLB engages, or
- The ACCEL altitude becomes equal to, or above the FCU selected altitude, or
- CLB arms.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-10-A-00025473.0001001 / 18 MAY 22

L2 The OP CLB mode can only engage, when all of the following are applicable:
- LAND or FLARE is not engaged, and
- If SRS GA is engaged, the aircraft is above 100 ft RA, and
- The aircraft is airborne for at least 5 s.

L1 OP CLB mode engages, when one of the following are applicable:
- The FCU selected altitude is above the aircraft altitude, and the flight crew pulls the ALT knob, or
- SRS TO or SRS GA is engaged with OP CLB armed, and the aircraft reaches the ACCEL altitude.

Ident.: DSC-22_30-40-40-10-A-00025475.0001001 / 18 MAY 22

REVERSIONS TO OP CLB

OP CLB also engages, when one of the following reversions occurs:
- CLB and NAV are engaged, and NAV disengages, or
- L2 CLB is engaged, and the vertical flight plan becomes invalid, or
- CLB is engaged, and the FMS flight phase changes to the descent or approach phase, or
- EXP CLB ◁ is engaged and the flight crew pulls the SPD/MACH knob, or
- L1 SRS TO, or SRS GA is engaged, the FCU selected altitude is above the aircraft altitude, and the flight crew pulls the SPD/MACH knob.

Ident.: DSC-22_30-40-40-10-A-00025476.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

OP CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22_30-40-40-10-00025474.0001001 / 18 MAY 22

Applicable to: ALL

OP CLB ASSOCIATION WITH ALTITUDE MODES

OP CLB is always associated to an altitude mode.
When OP CLB is engaged:

Conditions	The FMA displays the following message on Line 2 of the "AP/FD Vertical Modes" column:
The next altitude target is the FCU selected altitude. In addition, the FCU selected altitude is not set to the cruise altitude.	ALT is armed
The next altitude target is the cruise altitude. In this case, the FCU selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined on the PERF CRUISE page.*	ALT CRZ is armed

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-10-B-00025477.0001001 / 18 MAY 22

OP CLB disengages, when another vertical mode engages.

L2 OP CLB disengages, when one of the following occurs:

- ALT is armed, and the aircraft reaches the capture zone of the FCU selected altitude: ALT * engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages.
- The flight crew pushes the ALT knob, when:
  - NAV is engaged
  - The vertical flight plan is available
  - The FMS flight phase is neither the descent, nor the approach phase.

  CLB engages
- The flight crew pulls or pushes the V/S/FPA knob to engage V/S/FPA
- The flight crew pushes the EXPED pb ◁ to engage EXP CLB ◁ .

Ident.: DSC-22_30-40-40-10-B-00025478.0001001 / 18 MAY 22

REVERSIONS

OP CLB reverts to V/S/FPA, when the flight crew sets the FCU selected altitude below the aircraft altitude.

Ident.: DSC-22_30-40-40-10-B-00025479.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

CLB Mode

GENERAL

Ident.: DSC-22_30-40-40-20-00025582.0001001 / 18 MAY 22
Applicable to: ALL

CLB mode is a managed vertical mode.
CLB guides the aircraft vertically along the FMS flight plan, to the FCU selected altitude or to the next altitude constraint, whichever comes first. Therefore, altitude constraints, associated with applicable waypoints, are taken into account.
CLB can only be engaged, when NAV is engaged.

When CLB is engaged:
- AP/FDs controls the speed/Mach target (selected or managed) through the elevators

  Note: The FG system does not adjust the speed/Mach target to match the altitude constraints.

- If the A/THR is active, the A/THR will control the thrust.

CLB usually arms before it engages.

ARMING CONDITIONS

Ident.: DSC-22_30-40-40-20-00025583.0001001 / 18 MAY 22
Applicable to: ALL

CLB arms, when all of the following conditions are applicable:
- The aircraft is on ground, or SRS TO or SRS GA is engaged, and
- NAV is armed or engaged, or the vertical flight plan is available, and
- L2 The altitude set on the FCU is above the current altitude, and
- L1 The ACCEL altitude is available, and is below:
  - the FCU selected altitude, and
  - the next altitude constraint.

L2 CLB also arms, when CLB was previously engaged, and ALT CST* engages. This scenario is possible, when the selected altitude set on the FCU is above the altitude constraint.
L1 The flight crew can display and modify the ACCEL altitude on the PERF TAKEOFF and PERF GO AROUND pages.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-40-20-00025584.0001001 / 18 MAY 22
Applicable to: ALL

CLB disarms, when one of the following occurs:
- Another vertical mode engages, or
- NAV disarms, or NAV disengages, or
- L2 The flight crew sets the FCU target altitude at or below the altitude constraint, when ALT CST* or ALT CST is engaged, or
- The ACCEL altitude becomes equal to, or above the subsequent target altitude, when the aircraft is on ground, or when SRS TO or SRS GA is engaged, or
- L1 The FCU selected altitude is set to be below the aircraft altitude, or
- The FMS flight phase changes to DES or APPR phase.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-40-20-00025585.0001001 / 18 MAY 22
Applicable to: ALL

CLB engages, when all of the following are applicable:
- NAV is engaged, and
- The FMS flight phase is neither DES, APPR, nor go-around phase, and
- The vertical flight plan is valid, and
- The aircraft is airborne for at least 5 s.

CLB mode engages, when one of the following is applicable:
- SRS TO or SRS GA is engaged with CLB armed, and the aircraft reaches the ACCEL altitude, or
- ALT CST is engaged with CLB armed, and the aircraft sequences the altitude constraint, or
- The FCU selected altitude is set to be above the aircraft altitude, and the flight crew pushes the ALT knob.
  This scenario is applicable if CLB is not yet armed.

  Note: *If the aircraft altitude is within the capture zone of the FCU selected altitude, CLB will immediately disengage, and ALT* will engage.*

CLB ASSOCIATION WITH ALTITUDE MODES

Ident.: DSC-22_30-40-40-20-00025586.0001001 / 18 MAY 22
Applicable to: ALL

CLB is always associated to an altitude mode.
When CLB is engaged:

Conditions	The FMA displays the following message on Line 2 of the "AP/FD Vertical Modes" column:
The next altitude target is the FCU selected altitude. In addition, the FCU selected altitude is not set to the cruise altitude. However, the FCU selected altitude can be equal to an altitude constraint.	ALT is armed
The next altitude target is an altitude constraint, and the FCU selected altitude is above the altitude constraint.	ALT CST is armed
The next altitude target is the cruise altitude. In this case, the FCU selected altitude is equal to the cruise altitude. *Note:* *The cruise altitude is defined in the FMS PROG page.*	ALT CRZ is armed

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-40-20-A-00025587.0001001 / 18 MAY 22

CLB disengages, when another vertical mode engages.

Ident.: DSC-22_30-40-40-20-A-00025588.0001001 / 18 MAY 22

REVERSIONS

CLB also disengages, when one of the following reversions occurs:

- NAV disengages when:
  - The aircraft reaches a flight plan discontinuity, or
  - The next altitude target is an altitude constraint, and the flight crew engaged the HDG/TRK mode

  OP CLB engages
- The flight crew sets the FCU selected altitude below the aircraft altitude: V/S/FPA engages
- The vertical flight plan becomes invalid: OP CLB engages
- The FMS flight phase changes to DES or APPR phase: OP CLB engages.

Ident.: DSC-22_30-40-40-20-A-00025589.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

EXP CLB Mode

GENERAL

Ident.: DSC-22_30-40-40-30-00025501.0001001 / 18 MAY 22

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

EXP CLB is a vertical selected mode.
EXP CLB guides the aircraft vertically to the FCU selected altitude.

When EXP CLB is engaged:
- The speed target is Green Dot
- The AP/FD adjusts the pitch in order to maintain the speed target
- If the A/THR is active, the A/THR controls the thrust, THR CLB engages
- All the altitude constraints, the speed constraints and the SPD LIM are disregarded.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-40-30-00025502.0001001 / 18 MAY 22

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

EXP CLB engages, when all of the following are applicable:
- The aircraft is airborne for at least 5 s, and
- The managed speed is available, and
- The FCU selected altitude is above than the aircraft altitude, and the flight crew pushes the EXPED pb.

DISENGAGEMENT CONDITIONS

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597

Ident.: DSC-22_30-40-40-30-A-00025503.0001001 / 18 MAY 22

3

MANUAL DISENGAGEMENT

EXP CLB disengages manually, when one of the following condition occurs:
- The flight crew pulls the V/S / FPA knob, V/S / FPA engages, or
- The flight crew pulls the ALT knob, OP CLB engages, or
- The flight crew pushes the ALT knob, CLB engages provided that the engagement conditions are met.

AUTOMATIC DISENGAGEMENT

EXP CLB disengages automatically when ALT* engages.

Ident.: DSC-22_30-40-40-30-A-00025504.0001001 / 18 MAY 22

4

REVERSIONS

EXP CLB reverts to V/S / FPA, when one the following condition occurs:

- AP ON and FD ON, the aircraft exceeds VLS or VMAX, or
- AP OFF and FD ON, the flight crew not does not follow the FD orders and the aircraft speed reaches VMAX + 4 kt, or
- The flight crew selects an altitude below the aircraft altitude.

EXP CLB reverts to OP CLB, when the flight crew pulls the SPD / MACH knob.

Ident.: DSC-22_30-40-40-30-A-00025505.0001001 / 18 MAY 22

5

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flashes for 10 s.

ALT

GENERAL

Ident.: DSC-22_30-40-50-10-A-00025809.0001001 / 18 MAY 22
Applicable to: ALL

ALT* mode guides the aircraft to acquire the selected FCU altitude.
ALT mode maintains the selected FCU altitude.

The ALT* mode:
- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target

Ident.: DSC-22_30-40-50-10-A-00025864.0001001 / 18 MAY 22
Applicable to: ALL

- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached (VLS or VMAX becomes the priority target)

Ident.: DSC-22_30-40-50-10-A-00025856.0001001 / 18 MAY 22
1 **Applicable to: MSN 10949-11597**

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude

Ident.: DSC-22_30-40-50-10-A-00025858.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT mode when the altitude deviation becomes less than 20 ft.

Note: If the baro setting is changed during ALT mode, this may lead to an FCU target overshoot due to the change of the current value of the altitude. However ALT* mode will enable the FCU altitude to be regained.*

ALT ARMING CONDITIONS

Ident.: DSC-22_30-40-50-10-00025812.0001001 / 18 MAY 22
Applicable to: ALL

ALT arms, with FD/AP engaged, when the aircraft climbs or descends toward the FCU selected altitude.
However, ALT does not arm, when one of the following modes is engaged: G/S*, G/S, F-G/S* ⊲, F-G/S ⊲, FINAL APP, LAND, FLARE, ROLL OUT.

L2 ALT arms, if one of the following conditions occurs:
- The flight crew changes the altitude target on the FCU, or
- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or

- The AP/FD TCAS ◁ mode engages, or
- The difference between the aircraft altitude and the altitude set on the FCU is more than 250 ft.

L1 ALT arms, when one of the following occurs:

- OP CLB engages, and the FCU selected altitude is not set to the cruise altitude, or
- OP DES engages, or
- CLB engages, when the next altitude target is:
  - Equal to the FCU selected altitude
  - Not equal to the cruise altitude.
- DES engages, and the next altitude target is the FCU selected altitude, or
- V/S / FPA engages, and the next altitude target is the FCU selected altitude, or
- SRS TO or SRS GA engages, and the altitude target set on the FCU is above the current aircraft altitude.

ALT DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-10-00025816.0001001 / 18 MAY 22
Applicable to: ALL

ALT disarms when one of the following occurs:

- ALT* engages, or
- G/S*, F-G/S* ◁ , or FINAL APP engages, or
- ALT CST arms.

ALT* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-10-00025818.0001001 / 18 MAY 22
Applicable to: ALL

ALT* engages, when ALT is armed, and the aircraft reaches the capture zone of the altitude target.

L2 ALT* engagement is inhibited during 3 s after the selected altitude is changed on the FCU.

ALT* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-10-B-00025821.0001001 / 18 MAY 22

ALT* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-10-B-00025823.0001001 / 18 MAY 22

REVERSIONS

ALT* reverts to V/S / FPA when the flight crew changes the FCU selected altitude by more than 250 ft.

Ident.: DSC-22_30-40-50-10-B-00025825.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:

- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-10-00025830.0001001 / 18 MAY 22
Applicable to: ALL

ALT engages, when ALT* is engaged, and the aircraft reaches the altitude target.

L2 The aircraft is at the altitude target when the difference between the aircraft altitude and the altitude target is less than 40 ft for more than two seconds.

ALT engages, when one of the following occurs:

- ALT CST is engaged, and the flight crew sets the FCU selected altitude to the altitude constraint, or
- ALT CST is engaged, and NAV disengages.

ALT DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-10-C-00025841.0001001 / 18 MAY 22

ALT disengages, when any other vertical mode engages.

Ident.: DSC-22_30-40-50-10-C-00025842.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

ALT manually disengages, when one of the following occurs:

- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The FCU selected altitude is above the aircraft altitude
  - NAV is engaged
  - The FMS flight phase is neither descent, nor approach

  CLB engages

- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The FCU selected altitude is below the aircraft altitude
  - One of the following mode is engaged : NAV, LOC *, LOC, LOC B/C* ◁ , LOC B/C ◁
  - The FMS flight phase is not one of the following: takeoff, climb, go-around

  DES engages

L2 - The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The FCU selected altitude is set above the aircraft altitude
    The FCU selected altitude is at least 250 ft above the aircraft altitude
  - NAV is engaged
  - The FMS flight phase is neither descent, nor approach

  ALT CST engages
- The flight crew pushes the ALT knob, and all of the following conditions are applicable:
  - The aircraft altitude is equal to the altitude constraint
  - The FCU selected altitude is set below the aircraft altitude
    The FCU selected altitude is at least 250 ft below the aircraft altitude
  - One of the following mode is engaged : NAV, LOC *, LOC, LOC B/C* ◁ , LOC B/C ◁
  - The FMS flight phase is not one of the following: takeoff, climb, go-around

  ALT CST engages
- The aircraft altitude is equal to the FCU selected altitude, and the flight crew sets the cruise altitude to the aircraft altitude: ALT CRZ engages

L1 - The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-50-10-C-00025903.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

ALT automatically disengages, when one of the following occurs:

Ident.: DSC-22_30-40-50-10-C-00025843.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-50-10-C-00025844.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged, and
  - F-G/S ◁ is armed

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-50-10-C-00025845.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages.

Intentionally left blank

ALT CST

GENERAL

Ident.: DSC-22_30-40-50-20-A-00025810.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST* guides the aircraft to acquire an altitude constraint.
ALT CST maintains the altitude constraint delivered by the FMS.

The ALT CST* mode:
- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target

Ident.: DSC-22_30-40-50-20-A-00025865.0001001 / 18 MAY 22
Applicable to: ALL

- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached (VLS or VMAX becomes the priority target)

Ident.: DSC-22_30-40-50-20-A-00025861.0001001 / 18 MAY 22
1 **Applicable to: MSN 10949-11597**

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude

Ident.: DSC-22_30-40-50-20-A-00025862.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT CST mode when the altitude deviation becomes less than 20 ft.

Note: *For aircraft equipped with QFE option, a switching from STD to QFE (or QFE to STD) in ALT CST* mode, will change the target value and a reversion to V/S may occur if the target value is modified by 250 ft or more.*

ALT CST ARMING CONDITIONS

Ident.: DSC-22_30-40-50-20-00025814.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST arms, with FD/AP engaged, when the aircraft climbs or descends toward an altitude constraint delivered by the FMS.
However, ALT CST does not arm, when one of the following mode is engaged: G/S*, G/S, F-G/S* ◁ , F-G/S ◁ , FINAL APP, LAND, FLARE, ROLL OUT.

L2 ALT CST arms, if one of the following condition occurs:
- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or
- The AP/FD TCAS ◁ mode engages, or
- The difference between the aircraft altitude and the altitude constraint delivered by the FMS is more than 250 ft.

L1 ALT CST arms, when CLB (DES) engages, and:
- The next altitude target is an altitude constraint delivered by the FMS, and
- The FCU selected altitude is above (below) the altitude constraint.

ALT CST DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-20-00025817.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST disarms when one of the following occurs:
- ALT CST* engages, or
- G/S*, F-G/S* ◁ , or FINAL APP engages, or
- CLB is engaged, and one of the following occurs:
  - The FCU selected altitude becomes the next altitude target, or
  - OP CLB or V/S / FPA engages.
- DES is engaged, and one of the following occurs:
  - The FCU selected altitude becomes the next altitude target, or
  - OP DES or V/S / FPA engages, or
  - SRS GA engages.

ALT CST* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-20-00025820.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST* engages, when ALT CST is armed, and the aircraft reaches the capture zone of the altitude target.

L2 ALT CST* engagement is inhibited during 3 s after the selected altitude is changed on the FCU.

ALT CST* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-20-B-00025827.0001001 / 18 MAY 22

ALT CST* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-20-B-00025828.0001001 / 18 MAY 22

REVERSIONS

ALT CST* reverts to V/S / FPA if NAV disengages.

Ident.: DSC-22_30-40-50-20-B-00025829.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:
- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT CST ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-20-00025831.0001001 / 18 MAY 22
Applicable to: ALL

ALT CST engages, when ALT CST* is engaged, and the aircraft reaches the altitude target.

L2 ALT CST engages, when one of the following occurs:

- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - ALT is engaged, and
  - The aircraft altitude is equal to the altitude constraint, and
  - The FCU selected altitude is set above the aircraft altitude
    The FCU selected altitude is at least 250 ft above the aircraft altitude
  - NAV is engaged, and
  - The FMS flight phase is neither descent, nor approach, and
  - The vertical flight plan is valid

  CLB arms, or
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - ALT is engaged, and
  - The aircraft altitude is equal to the altitude constraint, and
  - The FCU selected altitude is set below the aircraft altitude, and
    The FCU selected altitude is at least 250 ft below the aircraft altitude
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C*, LOC B/C, F-LOC*, F-LOC and
  - The FMS flight phase is not one of the following: takeoff, climb, go-around

  DES arms.

ALT CST DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-20-C-00025853.0001001 / 18 MAY 22

ALT CST disengages, when any other vertical modes engages.

Ident.: DSC-22_30-40-50-20-C-00025854.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

ALT CST manually disengages, when one of the following occurs:

- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pulls or pushes the V/S / FPA knob: V/S / FPA engages
- The flight crew sets the altitude target on the FCU to the altitude constraint: ALT engages
- The flight crew removes the altitude constraint: CLB or DES engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-50-20-C-00025855.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

ALT CST automatically disengages, when one of the following occurs:

- The aircraft sequences the waypoint, for which the altitude constraint is associated
- NAV disengages: ALT engages

Ident.: DSC-22_30-40-50-20-C-00025857.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-50-20-C-00025859.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged, and
  - F-G/S ◁ is armed

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-50-20-C-00025860.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages.

ALT CRZ

GENERAL

Ident.: DSC-22_30-40-50-30-A-00025808.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ* mode guides the aircraft to acquire the cruise altitude, as selected on the FMS PROG page and on the FCU.
ALT CRZ mode maintains the cruise altitude, as selected on the FMS PROG page and on the FCU.

The ALT CRZ* mode:
- Has an internal V/S guidance that is a direct function of the difference between present altitude and the altitude target

Ident.: DSC-22_30-40-50-30-A-00025866.0001001 / 18 MAY 22
Applicable to: ALL

- Has an internal protection that decreases the vertical speed when VLS or VMAX is reached (VLS or VMAX becomes the priority target).

Ident.: DSC-22_30-40-50-30-A-00025867.0001001 / 18 MAY 22
1 **Applicable to: MSN 10949-11597**

- In the case of TA, in order to avoid spurious RA, automatically adjusts the V/S to reach the target altitude.

Ident.: DSC-22_30-40-50-30-A-00025868.0001001 / 18 MAY 22
Applicable to: ALL

The system switches automatically to ALT CRZ mode when the altitude deviation becomes less than 20 ft. Once ALT CRZ engages, the Altitude SOFT mode engages.
The Altitude SOFT mode corrects minor deviations from the Mach target by allowing a ±50 ft variation from the CRZ FL. This feature enhance fuel efficiency, passenger comfort and minimizes the changes in thrust.

Note: *If the baro setting is changed during ALT CRZ* mode, this may lead to an FCU target overshoot due to the change of the current value of the altitude. However ALT CRZ* mode will enable the FCU altitude to be regained.*

ALT CRZ ARMING CONDITIONS

Ident.: DSC-22_30-40-50-30-00025811.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ arms, with FD/AP engaged, when the aircraft climbs or descends toward the cruise altitude, as selected on the FMS PROG page and on the FCU.

However, ALT CRZ does not arm, when one of the following modes is engaged: G/S*, G/S, F-G/S* ◁✻ , F-G/S ◁✻ , FINAL APP, LAND, FLARE or ROLL OUT.

ALT CRZ arms, if one of the following condition occurs:
- The flight crew changes the altitude target on the FCU to the cruise altitude, as selected on the FMS PROG page, or
- ALT CRZ is engaged and the flight crew changes the altitude target on the FCU, or
- The flight crew changes the barometric reference (QNH, QFE, or STD) on the EFIS CP, or
- The AP/FD TCAS ◁✻ mode engages.

ALT CRZ DISARMING CONDITIONS

Ident.: DSC-22_30-40-50-30-00025815.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ disarms when one of the following occurs:
- ALT CRZ* engages, or
- The altitude target on the FCU is set below the cruise altitude: ALT arms.

ALT CRZ* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025819.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ* engages, when one of the following occurs:
- ALT CRZ is armed, and the aircraft reaches the capture zone of the altitude target, or
- ALT CRZ is engaged and the flight crew selects another FCU target altitude within the capture zone.

ALT CRZ* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-50-30-B-00025822.0001001 / 18 MAY 22

ALT CRZ* disengages when another vertical mode engages.

Ident.: DSC-22_30-40-50-30-B-00025824.0001001 / 18 MAY 22

REVERSIONS

ALT CRZ* reverts to V/S / FPA if NAV disengages.

Ident.: DSC-22_30-40-50-30-B-00025826.0001001 / 18 MAY 22

If within 5 s after reversion to V/S / FPA, to confirm the altitude target change, the flight crew does not:
- Pull the ALT knob, or
- Set a new V/S / FPA target, or
- Push the ALT pb on the FCU.

Then:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

ALT CRZ ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025832.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ engages, when ALT CRZ* is engaged, and the aircraft reaches the altitude target.

L2 ALT CRZ engages, when all of the following occur:
- ALT is engaged, and
- The aircraft altitude is equal to the FCU selected altitude, and
- The flight crew sets the cruise altitude to the aircraft altitude.

ALT CRZ DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-50-30-00025863.0001001 / 18 MAY 22
Applicable to: ALL

ALT CRZ disengages, when any other vertical mode engages.

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-60-10-00025590.0001001 / 18 MAY 22
Applicable to: ALL

During descent, OP DES or DES guides the aircraft vertically to an altitude target, or to a G/S or F-G/S ◁ capture zone.

Intentionally left blank

OP DES Mode

GENERAL

Ident.: DSC-22_30-40-60-20-00025591.0001001 / 18 MAY 22
Applicable to: ALL

OP DES is a vertical selected mode.
When OP DES is engaged, the AP/FD adjusts the pitch in order to maintain a Speed/Mach target (selected or managed). The A/THR then maintains idle thrust.
All the altitude constraints are disregarded.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-20-00025592.0001001 / 18 MAY 22
Applicable to: ALL

OP DES engages, if the FCU selected altitude is below the aircraft altitude and if one of the following occurs:

- The flight crew pulls the ALT knob, or
- EXP DES is engaged, and the flight crew pulls the SPD/MACH knob.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-60-20-A-00025593.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

OP DES disengages manually, when one of the following occurs:

- The flight crew pushes the EXPED pb ◁ to engage EXP DES ◁ .
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - One of the following modes is engaged: NAV, LOC*, LOC, F-LOC ◁ *, F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁
  - The FCU selected altitude is below the aircraft altitude
  - The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid

  DES engages, or
- The flight crew pulls or pushes the V/S/FPA knob: V/S/FPA engages, or
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-60-20-A-00025594.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

OP DES disengages automatically, when one of the following occurs:

- ALT is armed, the aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages

Ident.: DSC-22_30-40-60-20-A-00025595.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-60-20-A-00025596.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged
  - F-G/S ◁ is armed

  F-G/S ◁ * engages

Ident.: DSC-22_30-40-60-20-A-00025597.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-60-20-A-00025598.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

Ident.: DSC-22_30-40-60-20-A-00025599.0001001 / 18 MAY 22

REVERSION

OP DES reverts to V/S/FPA, if the flight crew sets the FCU selected altitude above the aircraft altitude.

Ident.: DSC-22_30-40-60-20-A-00025600.0001001 / 18 MAY 22

If within 5 s after reversion to V/S/FPA, the flight crew does not confirm the altitude target change by another expected action, then:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

DES Mode

GENERAL

Ident.: DSC-22_30-40-60-30-00025601.0001001 / 18 MAY 22
Applicable to: ALL

DES is a managed vertical mode.
DES guides the aircraft vertically along the vertical flight plan. All the altitude constraints associated to waypoints are taken into account.
When DES is engaged in idle path, the AP/FD adjusts the pitch in order to maintain a speed/Mach target. The A/THR then maintains the idle thrust.
When DES is engaged in geometric path, the AP/FD controls the vertical trajectory. The A/THR is then in SPEED/MACH.

ARMING CONDITIONS

Ident.: DSC-22_30-40-60-30-00025602.0001001 / 18 MAY 22
Applicable to: ALL

DES can only arm when:

- The altitude on the FCU is below the aircraft altitude
- NAV is armed, or engaged
- The FMS flight phase is cruise, descent, or approach
- The vertical flight plan path is valid.

DES arms, when one of the following occurs:

- DES is previously engaged with ALT CST armed, and ALT CST* engages, or
- ALT CST* or ALT CST is engaged, the flight crew pushes the ALT knob and the FMS authorizes DES to arm in accordance with the flight plan.

DISARMING CONDITIONS

Ident.: DSC-22_30-40-60-30-00025603.0001001 / 18 MAY 22
Applicable to: ALL

DES disarms, when one of the following occurs:

- NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁ mode disengages, or
- Another vertical mode engages, or
- ALT CST* or ALT CST is engaged, and the flight crew sets the FCU selected altitude to the altitude constraint, or
- The flight crew sets an altitude on the FCU above the aircraft altitude, or
- The vertical flight plan is lost.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-30-00025604.0001001 / 18 MAY 22
Applicable to: ALL

DES engages, when one of the following occurs:

- ALT CST is engaged with DES armed, and the aircraft sequences an ALT CST waypoint, or
- The flight crew pushes the ALT knob, and all the following conditions are applicable:
  - The FCU selected altitude is below the aircraft altitude
  - One of the following lateral modes is engaged: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁
  - One of the following vertical modes is engaged: OP DES, V/S/FPA, ALT*, ALT, ALT CRZ*, ALT CRZ, AP/FD TCAS ◁
  - The FMS flight phase is cruise, descent or approach
  - The vertical flight plan is valid.

Note: *DES will not engage if one of the following modes is engaged: G/S*, G/S, F-G/S ◁ *, F-G/S ◁ , FINAL APP, LAND.*

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-60-30-A-00025605.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

DES disengages manually, when one of the following occurs:

- The flight crew pushes the EXPED pb ◁ to engage EXP DES ◁
- The flight crew pulls the ALT knob: OP DES engages
- The flight crew pulls or pushes the V/S/FPA knob: V/S/FPA engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-60-30-A-00025606.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

DES disengages automatically, when one of the following occurs:

- The aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- The aircraft reaches the capture zone of the altitude constraint: ALT CST* engages

Ident.: DSC-22_30-40-60-30-A-00025607.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-60-30-A-00025608.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC ◁ * or F-LOC ◁ is engaged, and
  - F-G/S ◁ is armed

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-60-30-A-00025609.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-60-30-A-00025610.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

Ident.: DSC-22_30-40-60-30-A-00025611.0001001 / 18 MAY 22

REVERSIONS

DES reverts to V/S/FPA, when one the following occurs:

- The flight crew sets the FCU selected altitude above the aircraft altitude
- One of the following modes was engaged, and disengages: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁
- The vertical flight plan is lost.

Ident.: DSC-22_30-40-60-30-A-00025612.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

EXP DES Mode

GENERAL

Ident.: DSC-22_30-40-60-40-00025538.0001001 / 18 MAY 22

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

EXP DES is a vertical selected mode.
EXP DES guides the aircraft vertically to the FCU selected altitude.

When EXP DES is engaged:
- The speed target is 340 kt or M 0.8
- The AP/FD adjusts the pitch in order to maintain the speed target
- If the A/THR is active, the A/THR controls the thrust, THR IDLE engages
- All the altitude constraints, the speed constraints and the SPD LIM are disregarded.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-40-00025540.0001001 / 18 MAY 22

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

EXP DES engages, when all of the following are applicable:
- The aircraft is airborne for at least 5 s, and
- The managed speed is available, and
- The FCU selected altitude is below the aircraft altitude, and the flight crew pushes the EXPED pb.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-60-40-A-00025543.0001001 / 18 MAY 22

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

MANUAL DISENGAGEMENT

EXP DES disengages manually, when one of the following condition occurs:
- The flight crew pulls the V/S / FPA knob, V/S / FPA engages, or
- The flight crew pulls the ALT knob, OP DES engages, or
- The flight crew pushes the ALT knob, DES engages provided that the engagement conditions are met.

AUTOMATIC DISENGAGEMENT

EXP DES disengages automatically when ALT* engages.

Ident.: DSC-22_30-40-60-40-A-00025546.0001001 / 18 MAY 22

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

REVERSIONS

EXP DES reverts to V/S / FPA, when one the following condition occurs:
- AP ON and FD ON, the aircraft exceeds VLS or VMAX, or
- AP OFF and FD ON, the flight crew not does not follow the FD orders and the aircraft speed reaches VLS - 2 kt if the speed brakes are retracted or VLS - 17 kt if the speed brakes are extended, or
- The flight crew selects an altitude above the aircraft altitude.

EXP DES reverts to OP DES, when the flight crew pulls the SPD / MACH knob.

Ident.: DSC-22_30-40-60-40-A-00025548.0001001 / 18 MAY 22

Applicable to: MSN 02014

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flashes for 10 s.

GENERAL

Ident.: DSC-22_30-40-70-00025759.0001001 / 18 MAY 22
Applicable to: ALL

V/S and FPA are selected vertical modes. They are the basic modes of vertical guidance.
V/S/FPA acquires and holds the vertical speed or the flight path angle, that is displayed in the V/S/FPA window of the FCU.
When V/S/FPA engages following a reversion, the V/S/FPA target synchronizes on the current V/S/FPA of the aircraft, or the preselected V/S/FPA that is displayed in the V/S/FPA window of the FCU.

ENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-70-A-00025760.0001001 / 18 MAY 22

V/S/FPA engages, when one of the following occurs:
- The flight crew pushes or pulls the V/S/FPA knob

L2 V/S/FPA will not engage if LAND is engaged, or SRS GA is engaged below 100 ft RA

L1
- The APs and FDs are disengaged, and the flight crew engages the FDs or the AP HDG/TRK also engages
- The aircraft is airborne for at least 5 s, with no other vertical mode engaged.

V/S/FPA engages, in accordance with the HDG-V/S/TRK-FPA selection.

Ident.: DSC-22_30-40-70-A-00025761.0001001 / 18 MAY 22

REVERSIONS TO V/S / FPA

A vertical mode reverts to V/S/FPA, when one of the following occurs:
- OP DES, or DES is engaged and the FCU selected altitude is set above the aircraft altitude
- OP CLB, or CLB is engaged and the FCU selected altitude is set below the aircraft altitude
- DES is engaged and one of the following mode disengages: NAV, LOC*, LOC, F-LOC* ◁ , F-LOC ◁ , LOC B/C* ◁ , LOC B/C ◁
- FINAL APP is engaged and NAV disengages

L2
- The vertical flight plan is lost, when one of the following modes is engaged: DES, FINAL APP

L1
- G/S* or G/S is engaged, and LOC*or LOC disengages
- F-G/S* ◁ or F-G/S ◁ is engaged, and F-LOC* ◁ or F-LOC ◁ disengages
- The flight crew presses the LOC pb, or the APPR pb, when G/S*, G/S, F-G/S* ◁ or F-G/S ◁ is engaged

- ALT* is engaged, and the flight crew modifies the FCU selected altitude
- L2 The flight crew changes the approach, when one of the following vertical approach mode is engaged:
  - FINAL APP is engaged
  - G/S* or G/S is engaged, and the aircraft is below 700 ft RA
  - F-G/S* ◁ or F-G/S ◁ is engaged.

L1 Note: *The aircraft will target the V/S/FPA value displayed on the FCU instead of the current value, if the reversion occurs within 45 s after the preselection of a V/S/FPA value. As a consequence, this new V/S/FPA value may lead the aircraft to a path opposite to the current one, or to a steeper one.*

The AP/FD TCAS ◁ mode can also disengaged to revert to V/S mode.

Ident.: DSC-22_30-40-70-A-00025762.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-70-B-00025763.0001001 / 18 MAY 22

MANUAL DISENGAGEMENT

V/S/FPA disengages manually, when one of the following occurs:
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew pushes the ALT knob
  - NAV engages.
  - The FCU selected altitude is above the aircraft altitude
  - The FMS flight phase is neither descent, nor approach
  - The vertical flight plan is valid

  CLB engages
- The flight crew pushes the ALT knob
  - One of the following modes is engaged: NAV, LOC*, LOC, LOC B/C* ◁ , LOC B/C ◁ , F-LOC* ◁ , F-LOC ◁
  - The FCU selected altitude is below the aircraft altitude
  - The FMS flight phase is cruise, or descent
  - The vertical flight plan is valid

  DES engages

- The flight crew pushes the EXPED pb ◁ : EXP CLB or EXP DES engages
- The flight crew engages go-around: SRS GA engages.

Ident.: DSC-22_30-40-70-B-00025764.0001001 / 18 MAY 22

AUTOMATIC DISENGAGEMENT

V/S/FPA disengages automatically, when one of the following occurs:

- The aircraft reaches the capture zone of the FCU selected altitude: ALT* engages
- ALT CRZ is armed, and the aircraft reaches the capture zone of the cruise altitude: ALT CRZ* engages

Ident.: DSC-22_30-40-70-B-00025765.0001001 / 18 MAY 22

- The aircraft reaches the G/S capture zone when:
  - LOC* or LOC is engaged
  - G/S is armed

  G/S* engages

Ident.: DSC-22_30-40-70-B-00025766.0001001 / 18 MAY 22

- The aircraft reaches the F-G/S ◁ capture zone when:
  - LOC*, LOC, F-LOC* ◁ or F-LOC ◁ is engaged
  - F-G/S ◁ is armed

  F-G/S* ◁ engages

Ident.: DSC-22_30-40-70-B-00025768.0001001 / 18 MAY 22

- The aircraft reaches the FINAL capture zone, when:
  - APP NAV is engaged
  - FINAL is armed

  FINAL APP engages

Ident.: DSC-22_30-40-70-B-00025769.0001001 / 18 MAY 22

- AP/FD TCAS ◁ mode engages.

Intentionally left blank

General

GENERAL

Ident.: DSC-22_30-40-80-00-A-00025795.0001001 / 18 MAY 22
Applicable to: ALL

Flight guidance can perform different types of approaches.

Type of Guidance	Approach type
LOC G/S	- ILS approach - GLS approach - RNAV(GNSS) approach with LPV minima (with SLS)
LOC FPA	- RNAV(GNSS) with LP minima (with SLS)
F-LOC or LOC F-G/S	- RNAV(GNSS) with LNAV/VNAV or LNAV only minima - Navaids approaches (e.g. VOR, VOR/DME...) - ILS approach with glideslope failed - LOC only approach with no ILS glideslope - LOC B/C approach
FINAL APP	- RNAV(GNSS) with LNAV/VNAV or LNAV only minima - Navaids approaches (e.g. VOR, VOR/DME...) - RNAV (RNP) approach
NAV FPA	- RNAV(GNSS) with LNAV only minima - Navaids approaches (e.g. VOR, VOR/DME...)

Note: *The FLS guidance is only available if FLS parameters associated to the selected approach are available in the FMS database.*

Ident.: DSC-22_30-40-80-00-A-00025796.0001001 / 18 MAY 22
Applicable to: ALL

APPROACH SELECTION

STANDARD SELECTION

The flight crew selects the approach via the ARRIVAL page.

Ident.: DSC-22_30-40-80-00-A-00025797.0001001 / 18 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324

MANUAL TUNING ON THE FMS

If the flight crew manually-tunes an LS approach on the RADIO NAV page, the flight guidance system will disregard the manual tuning and guide the aircraft on the approach selected on the ARRIVAL page.

L2 If the approach selected on the ARRIVAL page and the LS approach set on the RADIO NAV page are different:

- The manually-tuned LS approach on the RADIO NAV page is disregarded, and the CHECK APPR SEL message is displayed on the FMA, and on the MCDU Scratchpad.
- The aircraft will fly the approach selected on the ARRIVAL page.

Ident.: DSC-22_30-40-80-00-A-00025797.0002001 / 18 MAY 22
1 **Applicable to: MSN 10949-11597**

MANUAL TUNING ON THE FMS

If the flight crew manually-tunes an LS approach on the RADIO NAV page, the flight guidance system will guide the aircraft on the manually-tuned approach.

L2 If the approach selected on the ARRIVAL page and the LS approach set on the RADIO NAV page are different:

- The approach selected on the ARRIVAL page is disregarded, and the CHECK APPR SEL message is displayed on the FMA, and on the MCDU Scratchpad
- The aircraft will fly the manually-tuned LS approach on the RADIO NAV page.

Ident.: DSC-22_30-40-80-00-A-00025798.0001001 / 18 MAY 22
Applicable to: ALL

MANUAL TUNING ON THE RMP (BACKUP)

If all the FMCs are fault, the flight crew selects the NAV key on the RMP 1 or 2, in order to manually-tune the frequency, or select a GLS ◁ approach, or an ILS approach.

Ident.: DSC-22_30-40-80-00-A-00025799.0001001 / 18 MAY 22
Applicable to: ALL

SELECTION IN THE MMRS

When an approach is selected on the ARRIVAL page, or manually-tuned on RADIO NAV page, or via the RMP, the approach frequency and course are sent to both MMRs.
In case of discrepancy between both MMRs the NAV LS TUNING DISAGREE alert triggers.

Note: *Below 700 ft RA, when an approach mode is engaged, the flight guidance system freezes the LS selection in the MMR. As a result, the MMR does not take into account any change of the LS selection.*

ILS/GLS (IF INSTALLED)/SLS (IF INSTALLED) GUIDANCE MODE

Applicable to: ALL

Ident.: DSC-22_30-40-80-00-B-00025800.0001001 / 18 MAY 22

ILS GUIDANCE MODE

An ILS guidance mode uses the Localizer and Glideslope signals from localizer antennas and a glideslope antenna on ground.

L2 The MMR computes the ILS lateral and vertical angular deviations.

L1 The ILS lateral deviation is referred to as the LOC deviation, and the ILS vertical deviation is referred to as the G/S deviation.

The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S beams.

APPROACH MODES

The ILS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

Ident.: DSC-22_30-40-80-00-B-00025801.0001001 / 18 MAY 22

GLS ⊲ GUIDANCE MODE

The GLS guidance mode uses the GNSS position with a correction and integrity signal from a ground station also known as GBAS.

L2 The MMR computes the GLS deviations.

L1 The GLS lateral deviation is referred to as the LOC deviation, and the GLS vertical deviation is referred to as the G/S deviation.

Note: *The computed lateral and vertical deviations are available up to 20 NM from the runway threshold.*

The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The GLS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA, and until end of roll out	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

Ident.: DSC-22_30-40-80-00-B-00025802.0001001 / 18 MAY 22

SLS ◁ GUIDANCE MODE

The SLS guidance mode uses the GNSS position with a correction and integrity signal from satellite constellations also known as SBAS.
The SLS guidance mode enables the flight crew to fly an RNAV (GNSS) straight-in approach with LPV minima, or LP minima with the LOC guidance mode only.
L2 The MMR computes the SLS deviations.
L1 The SLS lateral deviation is referred to as the LOC deviation, and the SLS vertical deviation is referred to as the G/S deviation.
The FG uses the LOC and G/S deviations in order to fly the aircraft along the LOC and G/S approach path, like ILS.

APPROACH MODES

The SLS guidance modes are:

	Lateral Guidance	Vertical Guidance
Above 400 ft RA	LOC*: Capture of the LOC beam LOC: Track of the LOC beam	G/S*: Capture of the G/S beam G/S: Track of the G/S beam
Below 400 ft RA	LAND: Track of LOC and G/S beams FLARE: Alignment of the yaw axis on the runway centerline, and flare on the pitch axis ROLL OUT: Track of the runway centerline, and nose down	

APPROACH AND LANDING CAPABILITY

In accordance with the approach minima and the landing technique, minimum approach and landing capabilities are required.

FLS GUIDANCE MODE

Applicable to: MSN 11531

2 Ident.: DSC-22_30-40-80-00-C-00025803.0001001 / 18 MAY 22

GUIDANCE SELECTION

The default guidance mode is the FLS mode.
The flight crew can check/select the appropriate guidance mode (FLS or FINAL APP) through the PERF APPR page.

CAUTION	For RNAV(RNP), FINAL APP must be selected.

3 Ident.: DSC-22_30-40-80-00-C-00025804.0001001 / 18 MAY 22

FLS FUNCTION AVAILABILITY

The FLS function is available, if the flight crew selects:
- A VOR, RNAV, GNSS, LOC or LOC B/C approach on the ARRIVAL page
- An ILS approach on the ARRIVAL page, and LOC pb on the FCU.

However, the FLS function is not available, if:
- The MAP is before the runway threshold, and
- The difference between the final approach course and the runway course is more than 50 °.

If the FLS function is not available for an approach, the NO FLS FOR THIS APPR message appears in the MCDU Scratchpad.

4 Ident.: DSC-22_30-40-80-00-C-00025805.0001001 / 18 MAY 22

APPROACHES FLOWN WITH LATERAL AND VERTICAL FLS GUIDANCE

The flight crew can use the FLS function to fly the following approaches with a lateral and vertical FLS guidance:
- NAVAIDS approaches (e.g. VOR, VOR/DME...)
- RNAV approach
- RNAV(GNSS) approach with LNAV/VNAV or LNAV minima only.

L2 The MMR computes the FLS deviations.

L1 The FLS function provides the flight crew with flight guidances like ILS, with:
- A pseudo LOC deviation, referred to as F-LOC deviation
- A pseudo G/S deviation, referred to as F-G/S deviation.

For more information on the FLS beam computation, *Refer to DSC-22_20-20-60 FLS Beam Computation - General*.

APPROACH MODES

The FLS guidance modes are:

Lateral Guidance	Vertical Guidance
F-LOC *: Capture of the F-LOC beam F-LOC: Track of the F-LOC beam	F-G/S *: Capture of the F-G/S beam F-G/S: Track of the F-G/S beam

5 Ident.: DSC-22_30-40-80-00-C-00025806.0001001 / 18 MAY 22

APPROACHES FLOWN WITH VERTICAL FLS GUIDANCE

The flight crew can use the FLS function to fly the following approaches with a vertical FLS guidance:
- ILS approach with glideslope out
- LOC only approach
- LOC B/C ◁ approach.

L2 The MMR computes the FLS deviations.

L1 The FLS function provides the flight crew with flight guidances like ILS, with:
- A LOC ILS deviation
- A pseudo G/S deviation, referred to as F-G/S deviation.

APPROACH MODES

The approach modes are:

Type of Approach	Lateral Guidance	Vertical Guidance
ILS with glideslope out **LOC only**	LOC*: Capture of the LOC beam LOC: Track of the LOC beam.	F-G/S*: Capture of the F-G/S beam F-G/S: Track of the F-G/S beam.
LOC B/C ◁	LOC B/C* ◁ : Capture of the LOC beam LOC B/C ◁ : Track of the LOC beam.	

FINAL APP GUIDANCE MODE

Ident.: DSC-22_30-40-80-00-00025906.0001001 / 18 MAY 22
Applicable to: ALL

APPROACH WITH FINAL APP GUIDANCE

The flight crew can use the FINAL APP mode in order to guide the aircraft laterally and vertically down to the Minimum, along the final descent profile computed by the FMS.

APPROACH MODES

The approach modes are:

Lateral Guidance	Vertical Guidance
APP NAV	FINAL
FINAL APP	

Intentionally left blank

LOC Mode

GENERAL

Ident.: DSC-22_30-40-80-10-00025415.0001001 / 18 MAY 22
Applicable to: ALL

The LOC* mode captures the localizer beam of the ILS/GLS ◁ /SLS ◁ .
The LOC mode tracks the localizer beam of the ILS/GLS ◁ /SLS ◁ .

LOC ARMING CONDITIONS

Ident.: DSC-22_30-40-80-10-00025416.0001001 / 18 MAY 22
Applicable to: ALL

LOC arms, when the flight crew presses the APPR pb, or the LOC pb, and one of the following conditions is applicable:

- An ILS, GLS ◁ , or RNAV(GNSS) with LPV(LP) minima (with SLS ◁ option) approach is set on the ARRIVAL page
- An ILS, GLS ◁ is manually-tuned on the RADIO NAV page

L2 *Note:* *If the flight crew sets a different ILS approach on the ARRIVAL page:*
- *The aircraft will fly the manually-tuned LS*
- *The MCDU displays the RWY/LS MISMATCH message.*

- At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers

L1 - A LOC only approach is set on the ARRIVAL page

L2 *Note:* *On aircraft equipped with the FLS ◁ function , the flight crew can also deselect the G/S of an ILS approach on the RADIO NAV page.*

L1 - The ILS frequency/GLS ◁ channel and course are manually-tuned on the RMP.

L2 LOC can only arm when all of the following are applicable:

- HDG/TRK or NAV is engaged, and
- The vertical mode is not SRS TO, nor SRS GA, and
- The aircraft is above 400 ft RA.

LOC DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-10-00025417.0002001 / 18 MAY 22

2 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

LOC disarms, when LOC* engages.

L2 LOC also disarms, when one of the following occurs:

- G/S or F-G/S ◁✳ is armed, and the flight crew presses the APPR pb, or
- Neither G/S, nor F-G/S ◁✳ is armed, and the flight crew presses the LOC pb, or
- NAV arms, or
- The flight crew engages go-around, or
- The LS parameters are different in both LS receivers.

LOC* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-10-A-00025418.0002001 / 18 MAY 22

Applicable to: ALL

LOC* engages, when LOC is armed, and the aircraft reaches the capture zone, or the pre-capture zone of the LOC beam.

PRE-CAPTURE ZONE OF THE LOC BEAM (ENHANCED LOC CAPTURE FUNCTION)

The pre-capture zone of the LOC beam is introduced through the Enhanced LOC Capture function. With the enhanced LOC Capture function, the aircraft uses the aircraft position and the FMS trajectory to provide guidance in order to pre-capture the LOC beam.

The pre-capture of the LOC beam allows to:

- Enhance the performance of the LOC capture
- Avoid a false capture
- Capture the LOC beam without overshoot.

The pre-capture zone is available, when all of the following conditions are applicable:
- The LOC deviation is more than 2.3 dots, and
- The FMS is in GPS PRIMARY , and
- L2 The difference between the track and the LOC course is between 25 ° and 115 °, and
- The roll order is such that LOC* will capture the LOC beam with a single turn.

L1 *Note:* *On the PFD and on the ND, the flight crew observes movement of the LOC deviation toward the center of the scale, only when the LOC deviation is less than 2 dots. This occurs when the aircraft is in the capture zone.*

Ident.: DSC-22_30-40-80-10-A-00025420.0001001 / 18 MAY 22
Applicable to: ALL

CAPTURE ZONE OF THE LOC BEAM

The aircraft reaches the capture zone of the LOC beam, when one of the following occurs:
- The LOC deviation is less than 2.3 dots, and:
  - L2 The difference between the track and the LOC course is between 25 ° and 115 ° , and
  - The roll order is such that LOC* will capture the LOC beam with a single turn.
- L1 The LOC deviation is less than 1.3 dot, and the difference between the track and the LOC course is less than 15 °.

L2 If the approach is an ILS, the LOC* mode uses the ILS LOC deviation to perform the capture.

L1 *Note:* *During the LOC capture, the LOC deviation starts to move toward the center of the LS scale, on the PFD and ND, when the LOC deviation is less than 2 dots.*

Ident.: DSC-22_30-40-80-10-A-00025421.0001001 / 18 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324

LOC CONVERGENCE FUNCTION

The purpose of the LOC convergence function is to help to intercept and capture the LOC axis.

The flight guidance intercepts the LOC axis with a 20 ° track convergence, when all the following conditions are applicable:
- The LOC mode is armed, and
- The NAV mode is engaged, and
- The aircraft is within 20 NM of the destination runway, and
- The difference between the aircraft track and the runway course is less than 20 °.

LOC* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-10-B-00025422.0001001 / 18 MAY 22

LOC* disengages, when another lateral mode engages.

L2 LOC* disengages, when one of the following occurs:
- The aircraft becomes established on the LOC beam: LOC engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRK engages, or
- The flight crew pulls the HDG/TRK knob: HDG/TRK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-10-B-00025423.0001001 / 18 MAY 22

REVERSIONS

LOC* reverts to HDG/TRK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed, or
  - G/S* is engaged, or
  - G/S is engaged, or
  - F-G/S ◁ is armed, or
  - F-G/S* ◁ is engaged, or
  - F-G/S ◁ is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC* reverts to HDG/TRK, the vertical mode also reverts to V/S / FPA.

Ident.: DSC-22_30-40-80-10-B-00025424.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

LOC ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-10-00025425.0001001 / 18 MAY 22
Applicable to: ALL

LOC engages, when LOC* is engaged, and the aircraft becomes established on the LOC beam.

LOC DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-10-C-00025426.0001001 / 18 MAY 22

LOC disengages, when another lateral mode engages.

L2 LOC disengages, when one of the following occurs:
- G/S is engaged, and LAND engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach, armed or engaged, HDG/TRK engages, or
- The flight crew pulls the HDG/TRK knob, HDG/TRK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO, NAV engages, or
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-10-C-00025427.0001001 / 18 MAY 22

REVERSIONS

LOC reverts to HDG/TRK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - G/S is armed, or
  - G/S* is engaged, or
  - G/S is engaged, or
  - F-G/S ◁ is armed, or
  - F-G/S* ◁ is engaged, or
  - F-G/S ◁ is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When LOC reverts to HDG/TRK, the vertical mode also reverts to V/S / FPA.

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

G/S Mode

GENERAL

Ident.: DSC-22_30-40-80-20-00025429.0001001 / 18 MAY 22
Applicable to: ALL

The G/S* mode captures the glide slope beam of the ILS / GLS / SLS.
The G/S mode tracks the glide slope beam of the ILS / GLS / SLS.

Note: In accordance with the below G/S and G/S engagement conditions, G/S or G/S* modes may engage at altitudes that are above the radio altimeter validity (8 000 ft for TRT, and 5 000 ft for Collins and Honeywell radio altimeters). In that case, the landing capability displayed on the FMA (CAT1) reflects the lack of radio altimeter validity until the radio altimeter becomes active. If the radio altimeters fail, or if the FGs don't receive any radio altimeter data, then LOC, G/S and both AP/FDs disengage and FDs re-engage on basic modes.*

G/S ARMING CONDITIONS

Ident.: DSC-22_30-40-80-20-00025430.0001001 / 18 MAY 22
Applicable to: ALL

G/S arms, when the flight crew presses the APPR pb, and one of the following conditions is applicable:

- An ILS, GLS, or RNAV(GNSS) with LPV minima (with SLS option) approach is set on the ARRIVAL page
- An ILS, or GLS approach is manually tuned on the RADIO NAV page

  Note: If the flight crew sets a different LS approach on the ARRIVAL page:
  - *The aircraft will fly the manually-tuned LS*
  - *The MCDU displays the RWY/LS MISMATCH message.*

L2 - At least one LS receiver must be operative. If both receivers are operative, the LS parameters must be the same in both LS receivers

L1 - The ILS frequency / GLS channel and course are manually-tuned on the RMP .

L2 G/S can only arm when all of the following are applicable:

- The mode is not SRS, RWY, RWY TRK, GA TRK
- The aircraft is above 400 ft RA.

G/S DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-20-00025431.0002001 / 18 MAY 22

1 **Applicable to: MSN 01376-01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

G/S disarms, when G/S* engages.

L2 G/S also disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb, or
- LOC disarms, or
- LOC*, or LOC is lost, or
- The AP/FD TCAS ◁ mode engages upon a RA, or
- The flight crew modifies the approach selection, or

  Note: *The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.*

- The flight crew performs a go around, SRS GA and GA TRK engage.

G/S DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-20-00025431.0001001 / 18 MAY 22

2 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

G/S disarms, when G/S* engages.

L2 G/S also disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb, or
- LOC disarms, or
- LOC*, or LOC is lost, or
- The AP/FD TCAS ◁ mode engages upon a RA, or
- The flight crew performs a go around, SRS GA and GA TRK engage.

G/S* ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-20-00025432.0001001 / 18 MAY 22

Applicable to: ALL

G/S* engages when the aircraft reaches the capture zone of the G/S beam, and all of the following conditions are applicable:
- G/S is armed, and
- LOC* or LOC is engaged.

L2 The aircraft reaches the capture zone of the G/S beam, when one of the following occurs:
- Passage far from the G/S beam:
  - The G/S deviation is less than 2 dots, and
  - The pitch order is such that G/S* will capture the G/S beam with a single resource.
- Passage near the G/S beam: The G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 1/3 dot.

G/S* DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-80-20-A-00025433.0001001 / 18 MAY 22

G/S* disengages, when another vertical mode engages.

L2 G/S* disengages, when one of the following occurs:
- The aircraft becomes established on the G/S beam: G/S engages
  G/S* is engaged for more than 15 s, and the G/S deviation becomes less than 1/3 dot
- The flight crew pushes or pulls the V/S / FPA knob: V/S / FPA engages
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew presses the ALT knob: ALT engages
- The AP/FD TCAS ◁ mode engages upon a RA (if LOC is engaged, LOC remains engaged, APPR pb comes off and the LOC pb comes on)
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-20-A-00025434.0001001 / 18 MAY 22

REVERSIONS

G/S* reverts to V/S / FPA, when one of the following occurs:
- LOC disengages: The lateral mode also reverts to HDG/TRK
- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRK
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRK
- The flight crew presses the LOC pb
- L2 The aircraft is above 700 ft RA, and the flight crew changes the approach on the FMS ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page. The lateral mode also reverts to HDG/TRK
- The FG detects a difference between both MMRs.

Ident.: DSC-22_30-40-80-20-A-00025435.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

REVERSIONS

G/S reverts to V/S / FPA, when one of the following occurs:
- LOC disengages: The lateral mode also reverts to HDG/TRK
- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRK
- The flight crew presses the LOC pb
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRK
- L2 The aircraft is above 700 ft RA, and the flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page. The lateral mode also reverts to HDG/TRK
- The FG detects a difference between both MMRs.

Ident.: DSC-22_30-40-80-20-B-00025439.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

Intentionally left blank

LAND Mode

GENERAL

Ident.: DSC-22_30-40-80-30-00025440.0001001 / 18 MAY 22
Applicable to: ALL

The LAND mode is a common vertical and lateral mode.
The LAND mode tracks the LOC and G/S beams from 400 ft RA to approximately 40 ft RA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-30-00025441.0001001 / 18 MAY 22
Applicable to: ALL

LAND automatically engages, when all the following conditions are applicable:
- The approach and landing capability is CAT1, CAT2 or CAT3, and
- LOC and G/S are engaged, and
- The aircraft is below 400 ft RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-30-00025442.0002001 / 18 MAY 22
Applicable to: ALL

LAND automatically disengages:

- When the aircraft approximately reaches 40 ft RA: FLARE engages, or
- When the flight crew disengages both AP/FD, or
- When the flight crew performs a go-around.

Intentionally left blank

FLARE Mode

GENERAL

Ident.: DSC-22_30-40-80-40-00025443.0001001 / 18 MAY 22
Applicable to: ALL

The FLARE mode is a common lateral and vertical mode:
- Lateral guidance: The FLARE mode reduces the slideslip angle, such that the aircraft will be aligned with the runway centerline at the aircraft touchdown
- Vertical guidance: The FLARE mode decreases the descent rate, in order to ensure a comfortable transition between the glide tracking, and the aircraft touchdown
- If the A/THR is active, the thrust is automatically reduced to IDLE.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-40-00025445.0001001 / 18 MAY 22
Applicable to: ALL

FLARE engages, if all the following conditions are applicable:
- The aircraft approximately reaches 40 ft RA
- The approach that the flight crew selects is either an ILS approach, a GLS approach, or an RNAV(GNSS) approach with LPV minima (with SLS).

L2 FLARE engages only if the following conditions are applicable:
- The slats/flaps are extended, or the landing gears are extended
- One valid RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-40-00025446.0002001 / 18 MAY 22
Applicable to: ALL

FLARE automatically disengages:
- When the aircraft touches down: ROLL OUT engages, or
- When the flight crew disengages both AP/FD, or
- When the flight crew perform a go-around.

Intentionally left blank

ROLL OUT Mode

GENERAL

Ident.: DSC-22_30-40-80-50-00025447.0001001 / 18 MAY 22
Applicable to: ALL

The ROLL OUT mode is a common lateral and vertical mode:
- Lateral guidance: The ROLL OUT mode guides the aircraft along the runway centerline
- Vertical guidance: The ROLL OUT mode lands the nose landing gear.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-50-00025448.0001001 / 18 MAY 22
Applicable to: ALL

The FLARE mode changes to the ROLL OUT mode when the aircraft touches down.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-50-00025449.0001001 / 18 MAY 22
Applicable to: ALL

ROLL OUT disengages, when one of the following occurs:
- The aircraft exits the runway, or

L2 *Note:* *When the difference between the aircraft track and the runway track is more than 20°, the ROLL OUT disengages due to the APs and FDs disengagement.*

L1
- The flight crew engages a go-around.

Intentionally left blank

F-LOC Mode

GENERAL

1 Ident.: DSC-22_30-40-80-60-00025450.0001001 / 18 MAY 22
Applicable to: MSN 11531

The F-LOC* mode captures the F-LOC beam.
The F-LOC mode tracks the F-LOC beam.

F-LOC ARMING CONDITIONS

2 Ident.: DSC-22_30-40-80-60-00025480.0003001 / 18 MAY 22
Applicable to: MSN 11531

L2 F-LOC can only arm when all of the following are applicable:

- At least one FMS is operative, and
- At least one MMR is able to compute the F-LOC and F-G/S deviations, and

  Note: *If the NO FLS FOR THIS APPR message appears on the MCDU, the MMR(s) will not be able to compute the F-LOC and F-G/S deviations.*

- When both MMRs are operative, the runway headings of the approach that the flight crew selects must be the same in both MMRs, and
- HDG/TRK or NAV is engaged, and
- The aircraft is above 400 ft RA, and
- The vertical mode is not SRS TO, nor SRS GA.

L1 F-LOC arms, when all of the following conditions are applicable:

- The approach selected in the ARRIVAL page is compatible with the FLS function (e.g. NDB, NDB/DME, VOR, VOR/DME, RNAV(GNSS),...), and

  Note: *If the NO FLS FOR THIS APPR message appears on the MCDU, the FLS function is not applicable.*

- The FLS mode is selected in the PERF APPR page of the MCDU, and
- The flight crew presses the APPR pb, or the LOC pb.

F-LOC DISARMING CONDITIONS

3 Ident.: DSC-22_30-40-80-60-00025481.0001001 / 18 MAY 22
Applicable to: MSN 11531

F-LOC disarms, when F-LOC* engages.

L2 F-LOC also disarms, when one of the following occurs:
- F-G/S is armed, and the flight crew presses the APPR pb, or
- F-G/S is not armed, and the flight crew presses the LOC pb, or
- NAV arms, or
- The flight crew engages go-around, or
- The flight crew modifies the approach selection, or

  Note: The flight crew can change the approach selection, only when the aircraft is above 700 ft RA.

- The LS parameters are different in both LS receivers.

F-LOC* ENGAGEMENT CONDITIONS

4 Ident.: DSC-22_30-40-80-60-00025451.0001001 / 18 MAY 22
Applicable to: MSN 11531

F-LOC* engages, when F-LOC is armed, and the aircraft reaches the capture zone or the pre-capture zone of the F-LOC beam.

PRE-CAPTURE ZONE OF THE F-LOC BEAM (ENHANCED LOC CAPTURE FUNCTION)

The pre-capture zone of the F-LOC beam is introduced through the Enhanced F-LOC Capture function. With the enhanced F-LOC Capture function, the aircraft uses the aircraft position and the FMS trajectory to provide guidance in order to pre-capture the F-LOC beam.

The pre-capture of the F-LOC beam allows to:
- Enhance the performance of the F-LOC capture
- Avoid a false capture
- Capture the F-LOC beam without overshoot.

The pre-capture zone is available, when all of the following conditions are applicable:
- The F-LOC deviation is more than 2.3 dots, and
- The FMS is in GPS PRIMARY ◁ , and
- L2 The difference between the track and the F-LOC course is between 25 ° and 115 °, and
- The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.

L1 **CAPTURE ZONE OF THE LOC BEAM**

The aircraft reaches the capture zone of the F-LOC beam, when one of the following occurs:
- The F-LOC deviation is less than 2.3 dots, and:

L2
  - The difference between the track and the F-LOC course is between 25 ° and 115 °, and
  - The roll order is such that F-LOC* will capture the F-LOC beam with a single turn.

L1
- The F-LOC deviation is less than 1.3 dot, and the difference between the track and the F-LOC course is less than 15 °.

F-LOC* DISENGAGEMENT CONDITIONS

Applicable to: MSN 11531

5 Ident.: DSC-22_30-40-80-60-A-00025482.0001001 / 18 MAY 22

F-LOC* disengages, when another lateral mode engages.

L2 F-LOC* disengages, when one of the following occurs:
- The aircraft becomes established on the F-LOC beam: F-LOC engages, or
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRK engages, or
- The flight crew pulls the HDG/TRK knob: HDG/TRK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around.

6 Ident.: DSC-22_30-40-80-60-A-00025483.0001001 / 18 MAY 22

REVERSIONS

F-LOC* reverts to HDG/TRK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan

L2
- The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When F-LOC* reverts to HDG/TRK, the vertical mode also reverts to V/S / FPA.

7 Ident.: DSC-22_30-40-80-60-A-00025484.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

F-LOC ENGAGEMENT CONDITIONS

8 Ident.: DSC-22_30-40-80-60-00025485.0001001 / 18 MAY 22
Applicable to: MSN 11531

F-LOC engages, when F-LOC* is engaged, and the aircraft becomes established on the F-LOC beam.

F-LOC DISENGAGEMENT CONDITIONS

Applicable to: MSN 11531

9 Ident.: DSC-22_30-40-80-60-B-00025486.0001001 / 18 MAY 22

F-LOC disengages, when another lateral mode engages.

L2 F-LOC disengages, when one of the following occurs:
- The flight crew presses the LOC pb, and there is no vertical managed mode of approach armed or engaged: HDG/TRK engages, or
- The flight crew pulls the HDG/TRK knob: HDG/TRK engages, or
- The aircraft is above 700 ft RA, and the flight crew inserts a DIRECT TO: NAV engages, or
- The flight crew performs a go-around.

10 Ident.: DSC-22_30-40-80-60-B-00025487.0001001 / 18 MAY 22

REVERSIONS

F-LOC reverts to HDG/TRK, when one of the following occurs:
- The flight crew presses the APPR pb, and one of the following conditions is applicable:
  - F-G/S is armed
  - F-G/S* is engaged
  - F-G/S is engaged.
- The flight crew inserts a DIRECT TO RADIAL IN or DIRECT TO RADIAL OUT in the active flight plan

L2
- The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
- The FG detects a difference between both MMRs.

L1 When F-LOC reverts to HDG/TRK, the vertical mode also reverts to V/S / FPA.

11 Ident.: DSC-22_30-40-80-60-B-00025488.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10s
- The FD bars flash for 10s.

Intentionally left blank

F-G/S Mode

GENERAL

1 Ident.: DSC-22_30-40-80-70-00025506.0001001 / 18 MAY 22
Applicable to: MSN 11531

The F-G/S* mode captures the F-G/S beam.
The F-G/S mode tracks the F-G/S beam.

F-G/S ARMING CONDITIONS

2 Ident.: DSC-22_30-40-80-70-00025507.0003001 / 18 MAY 22
Applicable to: MSN 11531

L2 F-G/S can only arm when all of the following are applicable:
- At least one FMS is operative, and
- At least one MMR is able to compute the F-G/S deviations, and
- When both MMRs are operative, the runway headings of the approach that the flight crew selects must be the same in both MMRs, and
- The aircraft is above 400 ft RA, and
- The vertical mode is not SRS TO, nor SRS GA.

L1 F-G/S arms, when all of the following conditions are applicable:
- The approach selected in the ARRIVAL page that is compatible with the FLS function (e.g. NDB, NDB/DME, VOR, VOR/DME, RNAV(GNSS),...), and

  Note: *If the NO FLS FOR THIS APPR message appears on the MCDU, the FLS function is not applicable.*

- The FLS mode is selected in the PERF APPR page of the MCDU, and
- The flight crew presses the APPR pb.

F-G/S DISARMING CONDITIONS

3 Ident.: DSC-22_30-40-80-70-00025508.0001001 / 18 MAY 22
Applicable to: MSN 11531

F-G/S disarms, when F-G/S* engages.

L2 F-G/S also disarms, when one of the following occurs:
- The flight crew presses the APPR pb, or the LOC pb, or
- LOC or F-LOC disarms, or
- LOC*, LOC, LOC B/C*, LOC B/C, F-LOC*, or F-LOC is lost, or

- The flight crew performs a go around: SRS GA and GA TRK engage, or
- The AP/FD TCAS ◁✳ mode engages.

F-G/S* ENGAGEMENT CONDITIONS

4 Ident.: DSC-22_30-40-80-70-00025509.0001001 / 18 MAY 22

Applicable to: MSN 11531

F-G/S* engages, when the aircraft reaches the capture zone of the F-G/S beam, and all of the following conditions are applicable:
- F-G/S is armed, and
- LOC*, LOC, LOC B/C*, LOC B/C, F-LOC* or F-LOC is engaged.

L2 The aircraft reaches the capture zone of the F-G/S beam, when one of the following occurs:
- Passage far from the F-G/S beam:
  - The F-G/S deviation is less than 2 dots, and
  - The pitch order is such that F-G/S* will capture the F-G/S beam with a single resource.
- Passage near the F-G/S beam: The F-G/S deviation is less than a threshold depending on the radio altitude.
  This threshold is between 0.1 and 1/3 dot.

F-G/S* DISENGAGEMENT CONDITIONS

Applicable to: MSN 11531

5 Ident.: DSC-22_30-40-80-70-A-00025510.0001001 / 18 MAY 22

F-G/S* disengages, when another vertical mode engages.

L2 F-G/S* disengages, when one of the following occurs:
- The aircraft becomes established on the F-G/S beam: F-G/S engages
  F-G/S* is engaged for more than 15 s, and the F-G/S deviation becomes less than 1/3 dot
- The flight crew pushes or pulls the V/S / FPA knob: V/S / FPA engages
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew presses the ALT knob: ALT engages
- The flight crew performs a go-around.

6 Ident.: DSC-22_30-40-80-70-A-00025511.0001001 / 18 MAY 22

REVERSIONS

F-G/S* reverts to V/S / FPA, when one of the following occurs:
- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRK
- F-LOC disengages: The lateral mode also reverts to HDG/TRK
- The flight crew presses the LOC pb
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRK
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page
  The lateral mode also reverts to HDG/TRK.
- The FG detects a difference between both MMRs.

7 Ident.: DSC-22_30-40-80-70-A-00025512.0001001 / 18 MAY 22

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

F-G/S ENGAGEMENT CONDITIONS

8 Ident.: DSC-22_30-40-80-70-00025513.0001001 / 18 MAY 22
Applicable to: MSN 11531

F-G/S engages, when F-G/S* is engaged, and the aircraft becomes established on the F-G/S beam.

F-G/S DISENGAGEMENT CONDITIONS

Applicable to: MSN 11531

9 Ident.: DSC-22_30-40-80-70-B-00025515.0001001 / 18 MAY 22

F-G/S disengages, when another vertical mode engages.

L2 F-G/S disengages, when one of the following occurs:
- The flight crew pushes or pulls the V/S / FPA knob: V/S / FPA engages
- The flight crew pulls the ALT knob: OP CLB or OP DES engages
- The flight crew presses the ALT knob: ALT engages
- The AP/FD TCAS mode engages upon a RA
- The flight crew performs a go-around, SRS GA and GA TRK engage.

10 Ident.: DSC-22_30-40-80-70-B-00025516.0001001 / 18 MAY 22

REVERSIONS

F-G/S reverts to V/S / FPA, when one of the following occurs:

- The flight crew presses the APPR pb: The lateral mode also reverts to HDG/TRK
- F-LOC disengages: The lateral mode also reverts to HDG/TRK
- The flight crew presses the LOC pb
- The flight crew pulls the HDG/TRK knob: The lateral mode also reverts to HDG/TRK
- L2 The aircraft is above 700 ft RA, and the flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page. The lateral mode also reverts to HDG/TRK
- The FG detects a difference between both MMRs.

11 Ident.: DSC-22_30-40-80-70-B-00025517.0001001 / 18 MAY 22

When the reversion occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

FINAL APP Mode

GENERAL

Ident.: DSC-22_30-40-80-90-00025519.0001001 / 18 MAY 22
Applicable to: ALL

FINAL APP is a lateral and vertical managed guidance approach mode that guides the aircraft during the final approach.

The FINAL APP mode includes the following modes:
- APP NAV mode for lateral guidance
- FINAL mode for vertical guidance.

APP NAV AND FINAL ARMING CONDITIONS

Ident.: DSC-22_30-40-80-90-00025520.0001001 / 18 MAY 22
Applicable to: ALL

APP NAV and FINAL modes arms, when all the following conditions are applicable:
- The flight crew presses the APPR pb
- The active flight plan is valid (lateral and vertical profile)
- The approach selected in the ARRIVAL page is compatible with the FINAL APP function (*Refer to PRO-NOR-SOP-18-A Cross-Reference Table*).

Note: *If an RNAV visual approach is selected, the flight crew must deselect the FLS mode via the PERF APPR page.*

APP NAV AND FINAL DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-90-00025521.0001001 / 18 MAY 22
1 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

APP NAV and FINAL modes disarms, when one of the following conditions occurs:
- The flight crew presses the APPR pb: NAV remains armed or NAV remains engaged
- The flight crew presses the LOC pb arming LOC mode
- NAV disarms, or NAV engages
- The flight crew performs a go around
- The FMS vertical profile is lost
- AP/FD TCAS mode engages. In this case, FINAL disengages and NAV remains engaged.

APP NAV AND FINAL DISARMING CONDITIONS

Ident.: DSC-22_30-40-80-90-00025521.0002001 / 18 MAY 22

2 **Applicable to: MSN 01376-01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

APP NAV and FINAL modes disarms, when one of the following conditions occurs:
- The flight crew presses the APPR pb: NAV remains armed or NAV remains engaged
- The flight crew presses the LOC pb arming LOC mode
- NAV disarms, or NAV engages
- The flight crew performs a go around
- The flight crew selects another approach than the one currently flown
- The FMS vertical profile is lost
- AP/FD TCAS mode engages. In this case, FINAL disengages and NAV remains engaged.

APP NAV ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-00025522.0001001 / 18 MAY 22

Applicable to: ALL

APP NAV and NAV modes engage under the same conditions:
- If NAV is engaged, APP NAV engages immediately
- If HDG/TRK is engaged, APP NAV engages when the intercept conditions are met (the aircraft track line must intercept the flight plan active leg).

APP NAV DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-00025523.0001001 / 18 MAY 22

Applicable to: ALL

APP NAV and NAV modes disengage under the same conditions (*Refer to DSC-22_30-40-30-20 Disengagement Conditions*).

FINAL APP ENGAGEMENT CONDITIONS

3 Ident.: DSC-22_30-40-80-90-A-00025524.0001001 / 18 MAY 22

Applicable to: MSN 11531

FINAL APP mode engages when all the following conditions are applicable:
- The aircraft is in the capture zone of the vertical FMS profile

L2 The vertical capture zone above and below the vertical FMS profile is defined as follow:
- Laterally: ±1.5 NM from the Final Descent Point
- Vertically: +150 ft above the Final Descent Point.

Ident.: DSC-22_30-40-80-90-A-00025524.0002001 / 18 MAY 22

4 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

FINAL APP mode engages when all the following conditions are applicable:

- The aircraft is in the capture zone of the vertical FMS profile

L2 The vertical capture zone above and below the vertical FMS profile is defined as follow:

- Laterally: ±1.5 NM from the Final Descent Point
- Vertically: +250 ft above the Final Descent Point.

5 Ident.: DSC-22_30-40-80-90-A-00025525.0001001 / 18 MAY 22
Applicable to: MSN 11531

- NAV or APP NAV is engaged
- FINAL is armed
- Predictions are available in FMS
- APPROACH phase is active, and the deceleration point has sequenced

  Note: *APPROACH phase may have to be manually activated on PERF APPR page if the approach starts at high altitude above aerodrome level (i.e. RNAV(RNP) approaches).*

- The aircraft intercepts a descending leg of the vertical flight path.

  Note: *If APPR pb is pressed earlier, FINAL APP mode may engage. As a consequence, resulting speed and altitude management in the FINAL APP may be inappropriate before FDP.*

A blue arrow is displayed on NDs to indicate where the FINAL APP engagement conditions are met and where the final descent will begin automatically.
If the same arrow is displayed in white, at least one engagement condition is not fulfilled, FINAL APP will not engage and the aircraft will not descend automatically.

Ident.: DSC-22_30-40-80-90-A-00025525.0002001 / 18 MAY 22

6 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

- NAV or APP NAV is engaged
- FINAL is armed
- Predictions are available in FMS

- APPROACH phase is active

  Note: *APPROACH phase may have to be manually activated on PERF APPR page if the approach starts at high altitude above aerodrome level (i.e. RNAV(RNP) approaches).*

- The aircraft intercepts a descending leg of the vertical flight path.

  Note: *If APPR pb is pressed earlier, FINAL APP mode may engage. As a consequence, resulting speed and altitude management in the FINAL APP may be inappropriate before FDP.*

A blue arrow is displayed on NDs to indicate where the FINAL APP engagement conditions are met and where the final descent will begin automatically.
If the same arrow is displayed in white, at least one engagement condition is not fulfilled, FINAL APP will not engage and the aircraft will not descend automatically.

Ident.: DSC-22_30-40-80-90-A-00025526.0001001 / 18 MAY 22
Applicable to: ALL

DEFINITION OF THE FINAL DESCENT POINT (ALSO CALLED VERTICAL INTERSECTION POINT "VIP" FOR RNAV (RNP) APPROACHES)

The FDP is the waypoint from which starts the FMS segment with coded FPA. For RNAV(RNP) approaches, this point may be indicated on the chart as FDP or "VIP".

This point is defined in the Navigation Database by:
- A constant vertical flight path beyond this point,
- A coded altitude constraint that may be "at" or "at or above" (e.g. +3 000 ft). This constraint is displayed on ND (in magenta), next to the corresponding waypoint, when the CSTR key is selected on the EFIS Control Panel. It is also shown on the F-PLN page at this WPT.

Note: *The FAF is the position from where the obstacle clearance is defined relative to an OCS. Obstacle clearance is only ensured if the aircraft is flying on the defined vertical flight path. Before the FAF, minimum altitudes are published with fixed MOC. The FDP is the point in the procedure at or before the FAF from which a constant vertical flight path is defined.*

FINAL APP DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-80-90-B-00025527.0001001 / 18 MAY 22
Applicable to: ALL

The FINAL APP mode disengages:
- When the AP/FD TCAS mode engages upon a RA, the FINAL mode disengages and the lateral NAV mode remains engaged. The APPR pb comes off

Ident.: DSC-22_30-40-80-90-B-00025528.0002001 / 18 MAY 22
Applicable to: ALL

- The flight crew pushes, or pulls out the V/S / FPA knob: V/S / FPA engages, NAV remains engaged

Ident.: DSC-22_30-40-80-90-B-00025529.0002001 / 18 MAY 22
Applicable to: ALL

- Automatically at MAP
- The flight crew performs a go-around.

Ident.: DSC-22_30-40-80-90-B-00025530.0001001 / 18 MAY 22
7 **Applicable to: MSN 01143-01251, 01801, 01826, 01855, 11531**

REVERSIONS

FINAL APP reverts to V/S/FPA, when one of the following occurs:
- NAV disengages: The lateral mode also reverts to HDG/TRK, or
- If the flight crew pulls out the HDG/TRK knob: The lateral mode also reverts to HDG/TRK, or
- The flight crew presses the APPR pb: The lateral mode remains engaged in NAV, or
- If the flight crew presses the LOC pb: The lateral mode also reverts to HDG-V/S and LOC arms if an ILS/GLS ◁✳ approach is selected, or
- The FMS flight phase is no longer cruise (CRZ), descent (DES) or approach (APPR).

Ident.: DSC-22_30-40-80-90-B-00025530.0002001 / 18 MAY 22
8 **Applicable to: MSN 01376-01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

REVERSIONS

FINAL APP reverts to V/S/FPA, when one of the following occurs:
- NAV disengages: The lateral mode also reverts to HDG/TRK, or
- If the flight crew pulls out the HDG/TRK knob: The lateral mode also reverts to HDG/TRK, or
- The flight crew presses the APPR pb: The lateral mode remains engaged in NAV, or
- If the flight crew presses the LOC pb: The lateral mode also reverts to HDG-V/S and LOC arms if an ILS/GLS ◁✳ approach is selected, or
- The FMS flight phase is no longer cruise (CRZ), descent (DES) or approach (APPR), or
- L2 The flight crew changes the approach on the ARRIVAL page, the frequency, the identification, or the course of the LS station on the RADIO NAV page.
  The lateral mode also reverts to HDG/TRK.

Ident.: DSC-22_30-40-80-90-B-00025531.0001001 / 18 MAY 22
Applicable to: ALL

When the reversion occurs:
- The triple click sounds
- The new guidance mode is boxed for 10 s
- The FD bars flash for 10 s.

General

GENERAL

Ident.: DSC-22_30-40-90-10-00025614.0002001 / 18 MAY 22
Applicable to: MSN 01376

Go-around combines SRS GA vertical mode, and GA TRK lateral mode.
SRS GA and GA TRK engage at the same time. They disengage at different moment.

At go-around engagement (i.e. SRS GA and GA TRK engage):
- The FMS flight phase becomes go-around
- If not previously engaged, the FDs automatically engage
- If FPD/FPV was previously displayed, it reverts to FD bars.

GENERAL

Ident.: DSC-22_30-40-90-10-00025614.0004001 / 18 MAY 22

1 **Applicable to: MSN 01143-01251, 01459-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

When the flight crew initiates a go-around, the SRS GA vertical mode engages. In addition, one of the following occurs:

- If a lateral managed mode is engaged (except NAV mode), GA TRK engages, and NAV mode arms
  NAV automatically engages as soon as the aircraft reaches the capture zone of the flight plan active leg.

  Note: *If a HDG/TRK was preset, NAV mode does not arm. GA TRK engages, until the flight crew pulls the HDG/TRK knob to follow the preset target.*

Intentionally left blank

SRS GA Mode

GENERAL

Ident.: DSC-22_30-40-90-20-A-00025615.0002001 / 18 MAY 22

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11522, 11572-11597**

The SRS mode is a managed vertical mode. This mode is applicable during takeoff and go-around.
This chapter is only about the SRS mode during go-around, also referred to as SRS GA mode.
The FMA displays SRS, when the SRS GA mode engages.
The SRS GA controls the speed target via the elevators.

L2 The guidance law also includes:
- A flight path angle protection, that ensures a positive climb
- A pitch angle protection to reduce the aircraft nose-up (18 ° of maximum pitch altitude or 22.5 °maximum in case of windshear)
- A speed protection, that ensures the aircraft does not exceed VFE.

L1 The speed target is the memorized aircraft speed at SRS GA engagement or VAPP, whichever is higher.

L2 The higher limit of the target is the lowest value between:
- 25 kt above VLS (or 15 kt above VLS when one engine is inoperative)
- 5 kt below VMAX.

L1 *Note:* *At SRS GA engagement, the speed becomes managed.*

2 Ident.: DSC-22_30-40-90-20-A-00025615.0014001 / 18 MAY 22
Applicable to: MSN 11531

L1 Note: *At SRS GA engagement, the speed becomes managed.*

Ident.: DSC-22_30-40-90-20-A-00025622.0002001 / 18 MAY 22
Applicable to: ALL

When the SRS GA mode disengages, the speed target becomes the smaller of Green Dot Speed or the speed constraints.

Note: *If the FMS flight phase is cruise, the SPD LIM or the SPD CSTR are still respected.*

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-20-00025616.0001001 / 18 MAY 22
Applicable to: ALL

SRS GA engages when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The slats or the flaps are extended
- The aircraft is airborne, or on ground for less than 30 s.

SRS GA mode can be engaged regardless of the vertical mode (except SRS TO).

DISENGAGEMENT CONDITIONS

Applicable to: ALL

Ident.: DSC-22_30-40-90-20-B-00025617.0001001 / 18 MAY 22

The SRS GA mode disengages when one of the following occur:
- At the go-around acceleration altitude (GA ACC ALT), or if ALT* or ALT CST* engages (above 400 ft RA)
- If the flight crew engages another vertical mode
- If the selected target altitude is above the aircraft altitude and the flight crew selects a speed: SRS GA reverts to OP CLB
- If the AP/FD TCAS ◁ mode engages upon a RA.

Note:
1. *In Engine Out conditions, the SRS GA mode does not automatically disengage at EO ACC ALT.*
2. *In dual AP configuration, disengagement of the go-around mode, on either axis, causes AP 2 to disconnect.*

Ident.: DSC-22_30-40-90-20-B-00025618.0001001 / 18 MAY 22

REVERSIONS

When SRS GA reverts to OP CLB, the following occurs:

- The triple click sounds
- The new guidance mode is boxed for 10 s.

Intentionally left blank

GA TRK Mode

GENERAL

Ident.: DSC-22_30-40-90-30-00025619.0001001 / 18 MAY 22
Applicable to: ALL

The GA TRK mode is a managed lateral mode that is applicable during go-around.
The GA TRK mode maintains the track of the aircraft, when the mode engages.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00025620.0002001 / 18 MAY 22
1 **Applicable to: MSN 01143-01251, 01459-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

GA TRK engages when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The slats or the flaps are extended
- The aircraft is airborne, or on ground for less than 30 s
- NAV, HDG, or TRK is not engaged.

GA TRK simultaneously engages with SRS GA.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00025620.0001001 / 18 MAY 22
Applicable to: MSN 01376

GA TRK engages, when all of the following conditions are applicable:
- The flight crew sets at least one thrust lever to the TOGA detent
- The slats or the flaps are extended
- The aircraft is airborne, or on ground for less than 30 s.

GA TRK simultaneously engages with SRS GA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-90-30-00025621.0001001 / 18 MAY 22
Applicable to: ALL

GA TRK disengages when another lateral mode engages.
L2 GA TRK cannot be disengaged below 100 ft RA.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-40-100-00025773.0001001 / 18 MAY 22

1 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode is an AP/FD vertical mode, that provides vertical guidance in the case of a RA alert, generated by the TCAS.
When a TA is triggered, the AP/FD TCAS mode arms.

When an RA is triggered, the AP/FD TCAS mode engages to provide guidance in accordance with the RA order:

- The AP status does not change: Remains engaged or disengaged
- If not previously engaged, the FDs automatically engage.

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode disengages.
The AP/FD provides guidance toward the latest target altitude set on the FCU.

AP/FD TCAS MODE AVAILABILITY

Ident.: DSC-22_30-40-100-00025774.0001001 / 18 MAY 22

2 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode is available, when all of the following conditions are met:

- The aircraft is above 900 ft RA
- The TCAS is not failed (i.e. the ECAM did not trigger NAV TCAS FAULT)
- TCAS is in TA/RA mode
- At least one AP, or one FD is available
- The AP/FD TCAS mode is not failed (i.e. the ECAM did not trigger the AUTO FLT TCAS MODE FAULT alert)
- EGPWS, WINDSHEAR, or STALL warning is not triggered.

To arm or engage, the AP/FD TCAS mode must be available.

ARMING CONDITIONS

Ident.: DSC-22_30-40-100-00025775.0001001 / 18 MAY 22

3 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode arms, when a TA alert is triggered.
The AP/FD TCAS mode arms, even if both APs, and both FDs are disengaged. In this case, the APs and FDs remain disengaged.

Note: *The arming of the AP/FD TCAS mode is inhibited when one of the following is applicable:*

- *The TA ONLY mode of the TCAS is selected, or*
- *The STANDBY mode of the TCAS is selected.*

DISARMING CONDITIONS

Ident.: DSC-22_30-40-100-00025776.0001001 / 18 MAY 22

4 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode disarms, when one of the following occurs:
- The intruder becomes white on the ND, or
- The AP/FD TCAS mode engages upon a RA alert, or
- The TA ONLY mode of the TCAS is selected, or
- The STANDBY mode of the TCAS is selected, or
- The AP/FD TCAS mode fails (i.e the ECAM triggers the AUTO FLT TCAS MODE FAULT alert).

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-100-00025777.0001001 / 18 MAY 22

5 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode engages, when a RA is triggered.
The AP/FD TCAS mode engages, even if both APs, and both FDs are disengaged. In this case, the FDs automatically engage.

Note:
- *When the AP/FD TCAS mode engages, the triple click audio indicator does not sound, and the FD pitch bar does not flash*
- *The engagement of the AP/FD TCAS mode is inhibited when one of the following is applicable:*
  - *The TA ONLY mode of the TCAS is selected, or*
  - *The STANDBY mode of the TCAS is selected.*

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-40-100-00025778.0001001 / 18 MAY 22

6 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

The AP/FD TCAS mode automatically disengages, when the "CLEAR OF CONFLICT" aural alert sounds.
Then the AP/FD engages in a vertical mode that leads the aircraft toward the target altitude set on the FCU.

The AP/FD TCAS mode also automatically disengages, if one of the following occurs:
- The TA ONLY mode of the TCAS is selected.
  The FMA then displays the TCAS RA INHIBITED message on Line 3 of the "Special Messages" column
- The STANDBY mode of the TCAS is selected.
  The FMA then displays the TCAS RA INHIBITED message on Line 3 of the "Special Messages" column

- The ECAM triggers the AP/FD AUTO FLT TCAS MODE FAULT alert, or
- The flight crew engages another AP/FD vertical mode (e.g. in the case of go-around).

Note: *If the AP/FD TCAS mode is lost while engaged, the vertical mode reverts to V/S. The vertical speed target is:*
- *0 ft/min if the RA order was to descend*
- *The TCAS vertical speed target at the time of the failure, if the RA order was to climb.*

NORMAL OPERATIONS - WHEN A TA IS TRIGGERED

Ident.: DSC-22_30-40-100-00025779.0001001 / 18 MAY 22

7 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

When a TA alert is triggered, the AP/FD TCAS mode arms.

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode arms, the AP and FDs engagement status does not change.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode arms, any engaged (armed) AP/FD lateral mode remains engaged (armed).

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode arms, any armed (engaged) AP/FD vertical mode remains armed (engaged).
The FMA displays TCAS on Line 3 of the "AP/FD Vertical Modes" column. Therefore, if another AP/FD vertical mode is armed, the FMA displays both modes.

NORMAL OPERATIONS - WHEN A RA IS TRIGGERED

Applicable to: MSN 01459, 08495-09324, 10949-11597

Ident.: DSC-22_30-40-100-A-00025780.0001001 / 18 MAY 22

8 At occurrence of any preventive or corrective RA, the AP/FD TCAS mode engages. It provides vertical guidance in accordance with the TCAS vertical speed orders.

Ident.: DSC-22_30-40-100-A-00025781.0001001 / 18 MAY 22

9

CONSEQUENCE ON AP AND FD

When the AP/FD TCAS mode engages:
- The AP engagement status does not change
- If not previously engaged, the FDs automatically engage.

Ident.: DSC-22_30-40-100-A-00025782.0001001 / 18 MAY 22

10
CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode engages, any engaged (armed) AP/FD lateral mode remains engaged (armed).
If both APs and both FDs are disengaged, when the AP/FD TCAS mode engages, HDG automatically engages. The heading target is the aircraft heading at HDG engagement.

Note: *When the AP/FD TCAS mode disengages (e.g. at the CLEAR OF CONFLICT), the FMA displays the TRK FPA DESELECTED message for 10 s on Line 3 of the "Special Messages" column, if the flying reference was TRK-FPA before the AP/FD TCAS mode engagement.*

Ident.: DSC-22_30-40-100-A-00025783.0001001 / 18 MAY 22

11
CONSEQUENCE ON AP/FD VERTICAL MODE

GUIDANCE

Depending on the RA and the FCU selected altitude, the AP/FD TCAS mode uses the guidance law of one of the following modes: V/S, ALT*, ALT, ALT CRZ*, ALT CRZ.

V/S Guidance

The AP/FD TCAS mode uses the guidance law of the V/S mode if:

- ALT/ALT CRZ is not armed, or
- The FCU selected altitude of ALT*, ALT, ALT CRZ* or ALT CRZ is not compatible with the RA order.

The vertical speed target is one of the following values:

- The aircraft vertical speed at the engagement of the AP/FD TCAS mode, if a preventive RA is triggered, or
- The limit between the green and red area of the vertical speed scale, ± 200 ft/min if the aircraft should climb (descend).

L2 The AP/FD TCAS mode ensures that the aircraft speed remains between VLS - 5 kt (VLS - 2 kt in landing configuration) and VMAX.

L1 *Note:* *In order to ensure a rapid response to the RA, the initial vertical speed may temporarily exceed the vertical speed target of the TCAS. The peak of the vertical speed is reached in less than 5 s after the vertical speed enters the TCAS green area.*

If the RA order changes, the AP/FD TCAS mode follows the new target.

ALT*, ALT, ALT CRZ* or ALT CRZ Guidance

The AP/FD TCAS mode uses the guidance law of the ALT / ALT CRZ / ALT* / ALT CRZ* mode if:

- ALT / ALT CRZ is armed, and
- The FCU selected altitude of ALT*, ALT, ALT CRZ* or ALT CRZ is compatible with the RA order.

Ident.: DSC-22_30-40-100-A-00025784.0001001 / 18 MAY 22

12 AP/FD VERTICAL MODE ENGAGED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any engaged AP/FD vertical mode disengages.

Note:
- *If G/S / F-G/S ◁ is engaged, when the AP/FD TCAS mode engages:*
  - *G/S / F-G/S ◁ disengages*
  - *LOC / F-LOC ◁ remains engaged*
  - *The APPR pb comes off, and the LOC pb comes on.*
- *If FINAL APP is engaged , when the AP/FD TCAS mode engages:*
  - *FINAL APP disengages*
  - *Managed lateral guidance remains engaged with NAV engaged*
  - *The APPR pb comes off.*

Ident.: DSC-22_30-40-100-A-00025785.0001001 / 18 MAY 22

13 AP/FD VERTICAL MODE ARMED AT OCCURRENCE OF THE RA

When the AP/FD TCAS mode engages, any armed AP/FD vertical mode disarms, except ALT / ALT CRZ if the altitude capture is compatible with the RA order.

Note:
- *If G/S / F-G/S ◁ is armed, when the AP/FD TCAS mode engages:*
  - *G/S / F-G/S ◁ disarms*
  - *The APPR pb comes off, and the LOC pb comes on.*
- *If FINAL is armed , when the AP/FD TCAS mode engages:*
  - *FINAL disarms*
  - *Managed lateral guidance remains engaged with NAV engaged*
  - *The APPR pb comes off.*

Note: If the approach is re-armed and if the capture conditions are fulfilled, the corresponding approach mode engages. The AP/FD TCAS mode disengages (even if it is not CLEAR OF CONFLICT). A RA may be triggered again.

CAPTURE OF THE SELECTED ALTITUDE IN AP/FD TCAS MODE

If ALT / ALT CRZ is armed, when the AP/FD TCAS mode engages:

- ALT / ALT CRZ remains armed if the capture of the FCU selected altitude is compatible with the RA order, and if the selected level is reached before the CLEAR OF CONFLICT.
  L2 If ALT / ALT CRZ is armed, and ALT capture conditions occur during the RA, the AP/FD TCAS mode captures the FCU selected altitude (without ALT* indicated on the FMA).
  This can occur when the TCAS triggers a preventive RA "MONITOR VERTICAL SPEED", or a corrective RA "ADJUST VERTICAL SPEED, ADJUST" aural alert.
  However, if the vertical speed order of the RA is zero, ALT / ALT CRZ disarms.
- L1 ALT / ALT CRZ disarms, if the capture of the FCU selected altitude is not compatible with the RA order.

WHITE BOX ON FMA

When a vertical mode disarms at AP/FD TCAS mode engagement, the FMA displays a white box for 10 s.

Ident.: DSC-22_30-40-100-A-00025786.0001001 / 18 MAY 22

14

CONSEQUENCE ON A/THR AND SPEED/MACH CONTROL

When the AP/FD TCAS mode engages:

- If the A/THR is disconnected, it becomes armed or active, depending on the thrust lever position
- If the A/THR is armed, it remains armed
- If the A/THR is active, it remains active.

A/THR ACTIVE

When the AP/FD TCAS mode engages, if the A/THR becomes / remains active, the SPEED/MACH mode engages.
The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the occurrence of the RA.
L2 If a new RA order occurs, the speed/Mach target changes, and becomes the aircraft speed/Mach at the occurrence of the new RA.

L1 A/THR ARMED

When the AP/FD TCAS mode engages, if the A/THR becomes / remains armed, the thrust target does not change.
The FMA displays the A/THR message, in accordance with the thrust lever position (e.g. MAN THR, MAN TOGA).

L2 Note: *If the flight crew sets the thrust levers to the CL detent, the A/THR activates. The SPEED/MACH mode engages. The speed/Mach control becomes selected, and the speed/Mach target becomes the aircraft speed/Mach at the A/THR activation.*

L1 LVR CLB Message on the FMA

In the case of AP/FD TCAS mode engagement when the A/THR is armed (e.g. RA order triggers below the THR RED ALT):

- If the vertical speed order of the RA is above 500 ft/min, the LVR CLB message is inhibited.
  However, if the speed becomes greater than VFE - 20 kt, the LVR CLB message flashes on the FMA.
- If the vertical speed order of the RA is equal to, or below 500 ft/min, the LVR CLB message flashes on the FMA even when below the THR RED ALT.

Ident.: DSC-22_30-40-100-A-00025787.0001001 / 18 MAY 22

15

CONSEQUENCE ON ALPHA FLOOR

When AP/FD TCAS mode is engaged, ALPHA FLOOR is temporarily inhibited:

- If all thrust levers are set to CLB detent when the RA is triggered, ALPHA FLOOR is inhibited while AP/FD TCAS mode is engaged.
- If at least one thrust lever is below the CLB detent when the RA is triggered, LVR CLB flashes on the FMA and ALPHA FLOOR is inhibited during 5 s, then:
  - If all thrust levers are set to the CLB detent, ALPHA FLOOR inhibition is maintained while AP/FD TCAS mode is engaged
  - If at least one thrust lever remains below the CLB detent, ALPHA FLOOR is reactivated.

NORMAL OPERATIONS - WHEN CLEAR OF CONFLICT

Ident.: DSC-22_30-40-100-00025788.0001001 / 18 MAY 22

16 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

When the "CLEAR OF CONFLICT" aural alert sounds, the AP/FD TCAS mode automatically disengages. The AP/FD provides guidance toward the previous FCU selected altitude.

CONSEQUENCE ON AP/FD LATERAL MODE

When the AP/FD TCAS mode disengages, any engaged/armed AP/FD lateral mode remains engaged/armed.

CONSEQUENCE ON AP/FD VERTICAL MODE

When the AP/FD TCAS mode disengages, one of the following modes engages: V/S, ALT*, ALT, ALT CRZ*, or ALT CRZ.

AP/FD TCAS MODE REVERSION TO ALT / ALT CRZ / ALT* / ALT CRZ*

If ALT / ALT CRZ is armed, when the AP/FD TCAS mode disengages:
- ALT*/ALT CRZ* engages, if the aircraft is within the capture zone of the FCU selected altitude
- ALT/ALT CRZ engages, if the aircraft altitude is equal to the FCU selected altitude
- In all other cases, V/S engages.

AP/FD TCAS MODE REVERSION TO V/S

When the AP/FD TCAS mode reverts to V/S when clear of conflict, all of the following occurs:
- ALT or ALT CRZ arms
- A triple click audio indicator sounds, and the pitch bar flashes for 10 s
- The vertical speed target depends on whether a preventive RA occurred, or a corrective RA occurred.

Vertical Speed Target - A Preventive RA Occurred

The vertical speed target remains the vertical speed target at the triggering of the RA.

Vertical Speed Target - A Corrective RA Occurred

The vertical speed target becomes:
- 500 ft/min, if the aircraft is at, or above 30 000 ft, and the FCU selected altitude is above the aircraft
- ±1 000 ft/min, in all other cases.
  V/S leads the aircraft toward the FCU selected altitude.

AP/FD MODE REVERSIONS

Ident.: DSC-22_30-40-110-A-00025789.0001001 / 18 MAY 22
Applicable to: ALL

REVERSION DUE TO FCU ALTITUDE CHANGES

Conditions	Event	Consequence
OP CLB engaged CLB engaged EXP CLB engaged	FCU selected altitude set below A/C altitude	V/S-FPA engages (*Refer to DSC-22_30-40-70 Reversions to V/S / FPA*)
OP DES engaged DES engaged EXP DES engaged	FCU selected altitude set above A/C altitude	
ALT * active	FCU selected altitude modification (greater than 250 ft)	

Ident.: DSC-22_30-40-110-A-00025790.0001001 / 18 MAY 22
Applicable to: ALL

REVERSION DUE TO THE LOSS OF NAV MODE

Conditions	Event	Consequence
CLB engaged	Loss of lateral managed mode: NAV	OP CLB engages
DES engaged		V/S engages (*Refer to DSC-22_30-40-70 Reversions to V/S / FPA*)

Ident.: DSC-22_30-40-110-A-00025791.0002001 / 18 MAY 22
Applicable to: ALL

SPEED PROTECTION WHEN FD ORDERS ARE NOT FOLLOWED BY THE FLIGHT CREW (AP NOT ENGAGED)

Conditions	Event	Consequence
FD engaged with: - AP OFF, and - OP DES, DES or EXP DES engaged, and - A/THR active (IDLE thrust).	IAS = VLS-2 kt (between VLS-2 kt and VLS-19 kt depending on the position of the speedbrakes)	FD bars disappear. If A/THR active, automatic engagement of SPEED mode on the A/THR. Thrust increases to recover the speed target.
FD is engaged with: - AP off, and - OP CLB, CLB or EXP CLB engaged, and - A/THR active (CLIMB thrust).	IAS = VMAX+4 kt	FD bars disappear. If A/THR active, automatic engagement of SPEED mode on the A/THR. Thrust decreases to recover the speed target.

Ident.: DSC-22_30-40-110-A-00025792.0004001 / 18 MAY 22
Applicable to: ALL

SPEED PROTECTION DUE TO EXCESSIVE V/S

Conditions	Event	Consequence
Excessive V/S or FPA selected in climb	IAS = VLS (or VLS-5 kt if target is VLS)	The selected V/S (or FPA) target is temporarily disregarded to maintain VLS in climb, or VMAX in descent.
Excessive V/S or FPA selected in descent	IAS = VMAX	

Note: *When flying with FD bars only (AP OFF), the FMGS adjusts the pitch so that VLS in climb, or VMAX in descent is maintained. However, no triple click is generated and the V/S target displayed on the FMA remains unchanged.*

Ident.: DSC-22_30-40-110-A-00025793.0001001 / 18 MAY 22
1 **Applicable to: MSN 01459, 08495-09324, 10949-11597**

SPEED PROTECTION DUE TO EXCESSIVE V/S TARGET (AP/FD TCAS MODE ENGAGED)

Conditions	Event	Consequence
Excessive V/S target in climb	IAS reaching VLS (or VLS - 5 kt if target is VLS or VLS - 2 kt if target is VLS in landing configuration)	The TCAS RA V/S target is temporarily disregarded to maintain VLS in climb, or VMAX in descent.
Excessive V/S target in descent	IAS reaching VMAX	

Note: *When flying with FD bars only (AP OFF), the FMGS adjusts the pitch so that VLS in climb, or VMAX in descent is maintained. However, no triple click is generated and the V/S target displayed on the FMA remains unchanged.*

Takeoff

TAKEOFF WITH NAV

Ident.: DSC-22_30-40-120-20-00025278.0001001 / 18 MAY 22
Applicable to: ALL

NAV and CLB arm when the aircraft is on ground, and:
- The FDs are engaged
- A runway and a SID are selected in the flight plan
- V2 is inserted in the PERF TAKE OFF page
- No FLX TO temperature, nor DRT TO level (Derated Takeoff ◁✱) is entered in the PERF TAKEOFF page
- The FCU selected altitude is set above the acceleration altitude
- The slats are extended.

When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS and RWY engage, and MAN TOGA appears on the FMA.
At least 5 s after liftoff, the flight crew can engage one AP.
At 30 ft RA, RWY disengages, and NAV engages.
When the aircraft reaches the thrust reduction altitude, LVR CLB flashes. The flight crew sets the thrust levers to the CL detent, MAN TOGA disappears, and THR CLB engages.
At the acceleration altitude, SRS disengages, and CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2+10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

TAKEOFF WITH HDG/TRK PRESET

Ident.: DSC-22_30-40-120-20-00025280.0001001 / 18 MAY 22
Applicable to: ALL

OP CLB arms when the aircraft is on ground, and:
- The FDs are engaged
- A runway is selected in the flight plan
- V2 is inserted in the PERF TAKEOFF page
- No FLX TO temperature, nor DRT TO level (Derated Takeoff ⩤) is entered in the PERF TAKEOFF page
- The FCU selected altitude is set above the acceleration altitude

- The flight crew turned the HDG/TRK knob on the FCU to select a heading (or track) preset The HDG/TRK window displays the heading (or track). The display remains, as long as RWY, RWY TRK, and HDG (or TRK) are engaged.
- The slats are extended.

When the aircraft is at the runway threshold, and the flight crew sets the thrust levers to TOGA, SRS and RWY engage, and MAN TOGA appears on the FMA.
At least 5 s after liftoff, the flight crew can engage one AP.
At 30 ft RA, RWY disengages, and RWY TRK engages.
When the flight crew pulls the HDG/TRK knob, HDG engages (HDG-V/S is selected).
At the thrust reduction altitude, THR CLB engages.
At the acceleration altitude, OP CLB engages.
From liftoff to the acceleration altitude, the managed speed target is V2+10 kt. At the acceleration altitude, the managed speed target becomes the applicable FMS speed target (e.g. CLB SPD LIM, ECON speed).

GENERAL

Ident.: DSC-22_30-50-10-00025367.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR manages the engine thrust.
The A/THR is either armed, active, or disconnected.

When active, two different types of A/THR modes are available:
- The SPEED/MACH mode:
  The A/THR continuously adjusts the thrust in order to maintain a Speed/Mach target (e.g. during cruise, and approach).
- The THRUST modes:
  The A/THR controls a fixed thrust, in accordance with the engaged THRUST mode.

The A/THR modes are automatically linked to the AP/FD vertical modes:
- When an AP/FD vertical mode controls the trajectory (e.g. altitude acquire modes, altitude hold modes, V/S/FPA, G/S, F-G/S ◁✻), the A/THR is in SPEED/MACH mode.
- When an AP/FD vertical mode adjusts the aircraft pitch in order to maintain a speed/Mach target (e.g. climb, descent), the A/THR is in THRUST mode.

When the A/THR is active, the A/THR thrust target is sent to the FADECs. The FADECs computes thrust commands, in accordance with the aircraft environment and status. The thrust commands are then sent to the engines.
When the A/THR is armed, the FADECs compute the thrust commands in accordance with the thrust lever positions, and the selection of PERF TAKEOFF page.
When the A/THR is disconnected, the FADECs compute the thrust commands in accordance with the thrust lever positions.

Intentionally left blank

THRUST LEVERS

Ident.: DSC-22_30-50-20-00025369.0001001 / 18 MAY 22
Applicable to: ALL

The position of the thrust levers determines the A/THR status: active, armed or disconnected.

The thrust levers have:
- Four detents: IDLE, CL, FLX-MCT, TOGA
- Two instinctive disconnect pushbuttons.

The flight crew uses the thrust levers to:
- Arm, activate, or disconnect the A/THR
- Engage the takeoff and go-around modes
- Manually control the thrust of each engine, when the A/THR is disconnected
- Engage reverse thrust.

Intentionally left blank

PRELIMINARY CONDITIONS REQUIRED FOR A/THR ARMING AND ACTIVATION

Applicable to: ALL

Ident.: DSC-22_30-50-30-A-00025370.0001001 / 18 MAY 22

A/THR can only arm when all of the following are applicable:
- At least one FMGC is available, and
- At least one FAC is available, and
- Two ADIRUs are available, and
- Two FADECs are available, and
- At least one channel of the FCU is available, and
- At least one LGCIU is available, and
- The A/THR is not manually disabled (Instinctive Disconnect pb has not been pressed for more than 15 s).

A/THR ARMING

Ident.: DSC-22_30-50-30-B-00025374.0001001 / 18 MAY 22
Applicable to: ALL

ARMING CONDITIONS

The A/THR arms, if one of the following occurs:
- At takeoff, the flight crew sets at least one thrust lever:
  - To the TOGA detent, or
  - To the FLX-MCT detent, when a FLX TO temperature or a DRT TO level (Derated Takeoff ◁) is entered in the PERF TAKEOFF page

  SRS TO engages
- By engaging a go-around (MAN TOGA), the flight crew sets the thrust levers to the TOGA detent: SRS GA engages
- By engaging a Soft Go-Around ◁ (MAN GA SOFT), the flight crew sets the thrust levers to the TOGA detent, then to the FLX/MCT detent: SRS GA engages
- The flight crew presses the A/THR pb on the FCU, when the A/THR is disconnected, provided that all the following occur:
  - The thrust levers are outside of the A/THR active range:
    - Above CL detent (AEO), or
    - Above FLX-MCT detent (OEI)
  - The aircraft is above 100 ft RA, or all RAs are failed
  - LAND or FLARE is not engaged.
- AP/FD TCAS ◁ engages due to a RA, when the A/THR is disconnected and the thrust levers are outside of the A/THR active range.

Ident.: DSC-22_30-50-30-B-00025631.0001001 / 18 MAY 22
Applicable to: MSN 10949-11597

- When the aircraft is in an overspeed situation above 400 ft:
  - The speed is above VMAX + 5 kt in clean configuration, or
  - The speed is above VMAX + 9 kt, when slats or flaps are extended.

  Note: *A triple click sounds when the A/THR arms.*

Ident.: DSC-22_30-50-30-B-00025632.0001001 / 18 MAY 22
Applicable to: ALL

In addition, A/THR can be armed by a flight crew action on the thrust levers, when the A/THR is active.

Ident.: DSC-22_30-50-30-B-00025376.0001001 / 18 MAY 22
Applicable to: ALL

ANNUNCIATION

When the A/THR is armed:
- The A/THR pb light of the FCU is on
- The FMA displays:
  - A/THR on Line 3 of the "AP, FD, and A/THR Engagement Status" column
  - One of the following A/THR modes in the "A/THR messages and modes" column: MAN TOGA, MAN FLEX +XX, MAN DTO, MAN GA SOFT ◁✻ , MAN MCT, or MAN THR

As long as the A/THR is not active, the A/THR messages on the FMA displays the manual thrust as follows:

Conditions		Thrust lever position	FMA Message(1)
From takeoff, and until the thrust reduction altitude	The flight crew performs a takeoff with no selected FLX TO temperature, or DRT TO level (Derated Takeoff ◁✻)	TOGA (2) (3)	MAN TOGA
	The flight crew entered a FLX TO temperature in the FMS PERF TAKEOFF page	FLX-MCT (3)	MAN FLX +XX
	The flight crew entered a DRT TO level (Derated Takeoff ◁✻) in the PERF TAKEOFF page	FLX-MCT (3)	MAN DTO

Continued on the following page

Continued from the previous page

Conditions		Thrust lever position	FMA Message(1)
In descent, or approach	The flight crew performs a go-around	TOGA *(3)* *(4)*	MAN TOGA
	The flight crew performs a soft go-around ◁	TOGA then FLX-MCT *(3)* *(4)*	MAN GA SOFT

(1) *The FMA message appears in a white box, on the first and second lines of the "A/THR messages and modes" column.*

(2) *If the flight crew sets the thrust levers to FLX-MCT, MAN MCT will appear on FMA.*

(3) *If the flight crew sets the thrust levers between CL and TOGA, but not at the CL, FLX-MCT, or TOGA detent, MAN THR will appear on FMA.*

(4) *If the flight crew sets the thrust levers directly to FLX-MCT and not TOGA then FLX-MCT, the MAN THR will appear on the FMA.*

A/THR ACTIVATION

Ident.: DSC-22_30-50-30-C-00025377.0001001 / 18 MAY 22
Applicable to: ALL

GENERAL

When active, the A/THR controls:
- The thrust, when an A/THR THRUST mode is engaged, or
- The speed/Mach, when the A/THR SPEED/MACH mode is engaged.

The thrust lever positions determine the maximum thrust that the A/THR can command (except in A.FLOOR).

The normal position of the thrust levers is with A/THR active is:
- The CL detent (AEO)
- The FLX-MCT detent for the operative engine (OEI).

Note: *The thrust lever of a failed engine should be in the IDLE detent.*

Ident.: DSC-22_30-50-30-C-00025378.0001001 / 18 MAY 22
Applicable to: ALL

ACTIVATION CONDITIONS

The A/THR activates, if one of the following occurs:

- The A/THR is armed, and the flight crew sets the thrust levers in the active range:

L12

Engine Condition	Active Range
AEO	Both thrust levers are above idle, and at or below the CL detent. The A/THR also activates when: - One thrust lever is above the idle detent, and at or below the CL detent, and - The other thrust lever is • At the idle detent, or • Above the CL detent, and at or below the FLX-MCT detent. *Note: In the case of takeoff with FLEX or Derated Takeoff ⊲ selection, the thrust lever must be below the FLX-MCT detent.*
OEI(1)	One thrust levers is above the idle detent, and at or below FLX-MCT detent. If the engine-out occurs during a FLEX or Derated Takeoff ⊲ , the flight crew activates the A/THR by: 1. Setting the thrust lever of the operative engine below FLX-MCT, 2. Then, settings the thrust lever of the operative engines back to FLX-MCT.

(1) *The thrust lever of the failed engine should be at the idle detent.*

- The flight crew presses the A/THR pb on the FCU when the A/THR is disconnected, provided that:
  - The thrust levers are in the active range
  - L2 The aircraft is above 100 ft RA, or all RAs are failed
  - LAND or FLARE is not engaged.
- L1 A.FLOOR engages

  Note: A.FLOOR engages regardless of the initial A/THR status, and the position of the thrust levers.

- AP/FD TCAS ⊲ engages, upon a RA, when the A/THR is disconnected and the thrust levers are in the active range.

Ident.: DSC-22_30-50-30-C-00025379.0001001 / 18 MAY 22
Applicable to: ALL

ANNUNCIATION

When the A/THR is active:
- The A/THR pb light is illuminated on the FCU
- The EWD displays the thrust target
- The FMA displays:
  - A/THR on Line 3 of the "AP, FD, and A/THR Engagement Status" column
  - A/THR mode on Line 1 of the "A/THR messages and modes" column.

Ident.: DSC-22_30-50-30-C-00025848.0001001 / 18 MAY 22
2 **Applicable to: MSN 10949-11597**

A/THR IN OVERSPEED

When the A/THR is active in an overspeed situation, the A/THR targets one of the following speed, whichever is lower:
- The speed bug indicated on the PFD, or
- VMAX - 5 kt in clean configuration, or
- VMAX when slats or flaps are extended.

Note: *When the A/THR is active, the FMA displays SPEED or MACH associated with a flashing amber box.*

Ident.: DSC-22_30-50-30-C-00025380.0001001 / 18 MAY 22
Applicable to: ALL

EFFECT OF THRUST LEVER MOVEMENT WHEN THE A/THR IS ACTIVE

A/THR TRANSITION FROM ACTIVE TO ARMED

When the A/THR is active, the A/THR becomes armed as described in the following table:

L12

Engine Condition	Thrust Lever Position
AEO	All the thrust levers are above the CL detent. Or at least one thrust lever is above the FLX-MCT detent.
OEI	The thrust lever of the operative engine is above the FLX-MCT detent.

When the A/THR becomes armed, the thrust immediately increases, in accordance with the thrust lever position (above CL detent (AEO) or above FLX-MCT detent (OEI)).
The FMA displays MAN THR on Line 1 of the "A/THR Modes and Messages" column.

A/THR LIMITED

The A/THR limits the engine thrust at the thrust levers position when:

- All the thrust levers are set below the CL detent (AEO), or
- The thrust lever of all operative engines are set below FLX-MCT detent (OEI).

When the thrust is limited, the AUTO FLT A/THR LIMITED alert triggers.
L2 The AUTO FLT A/THR LIMITED alert is repeated every 5 s, until the flight crew moves the thrust levers to the CL detent (AEO) or FLX-MCT detent (OEI).
L1 The FMA displays THR LVR on Line 1 of the "A/THR Modes and Messages" column.
LVR CLB or LVR MCT flashes on Line 3 in the "A/THR Modes and Messages" of the FMA.
This reminds the flight crew that the normal position of the thrust levers, when A/THR is active, is the CL detent (AEO) or the FLX-MCT detent (OEI).

L2 LVR CLB flashes on the FMA, when all the following conditions are applicable:
- All engines are operative (AEO)
- The position of the thrust levers are not appropriate:
  - Both thrust levers are below the CL detent, or
  - One thrust lever is above CL detent
- The aircraft is above 100 ft
- No windshear is detected.

LVR MCT flashes on the FMA, when all the following conditions are applicable:
- One engine is inoperative (OEI)
- The position of the thrust lever of the operative engines is not appropriate:
  - The thrust lever is below the FLX-MCT detent, or
  - The aircraft is above the thrust reduction altitude, and the thrust lever is above FLX-MCT
- The aircraft is above 100 ft
- No windshear is detected.

L1 ASYMMETRIC THRUST LEVERS

LVR ASYM flashes on the FMA if all the following conditions are satisfied:
- The A/THR is armed or active, and
- At least one thrust lever is set to CL detent or FLX-MCT detent , and
- One thrust lever is not in the same position, and
- L2 The aircraft is above 100 ft RA.

L1 *Note:* ***LVR ASYM*** *flashes until the flight crew sets all thrust levers to the CL detent or the FLX-MCT detent.*
LVR ASYM *will not be displayed in the case of OEI or if the flight crew sets one thrust lever to the IDLE detent.*

A/THR DISCONNECTION

Ident.: DSC-22_30-50-40-A-00025381.0001001 / 18 MAY 22
Applicable to: ALL

GENERAL

STANDARD DISCONNECTION

The A/THR disconnects if one of the following occurs:
- The flight crew presses an A/THR instinctive disconnect pb, or

  Note: *In normal operation, if the flight crew presses the A/THR instinctive disconnect pb, the engine thrust target is set to the thrust lever position.*
- The flight crew sets all the thrust levers to the IDLE detent.

NON-STANDARD DISCONNECTION

The A/THR disconnects if one of the following occurs:
- The flight crew presses the A/THR pb on the FCU
- The A/THR becomes inoperative

L2 One of the preliminary conditions required for A/THR arming or activation is no longer applicable.

Ident.: DSC-22_30-50-40-A-00025633.0002001 / 18 MAY 22
1 **Applicable to: MSN 10949-11597**

- When the airspeed reaches VLS after an A.FLOOR activation, the A/THR disconnects if not connected before the A.FLOOR activation.

Ident.: DSC-22_30-50-40-A-00025634.0001001 / 18 MAY 22
2 **Applicable to: MSN 10949-11597**

- When the airspeed reaches VMAX after an automatic arming or activation due to an overspeed situation, the A/THR disconnects if not armed nor active before the overspeed situation.

Ident.: DSC-22_30-50-40-A-00025635.0001001 / 18 MAY 22
Applicable to: ALL

L2 For more information on how to the set the autothrust to off, *Refer to FCTM/AS-FG-10-2 To Set Autothrust To Off*.

L1

CAUTION	If the flight crew presses, and holds one A/THR instinctive disconnect pb for more than 15 s, the A/THR will disconnect for the remainder of the flight. All A/THR modes, including A.FLOOR, will be lost. The A/THR will be recovered at the next FMGC power-up on the ground.

Ident.: DSC-22_30-50-40-A-00025382.0002001 / 18 MAY 22
Applicable to: ALL

THRUST LOCK FUNCTION

The thrust lock function activates if an A/THR non-standard disconnection occurs.

As long as the thrust lock function is active, all the following are applicable:
- The engines maintain the thrust at the value set before the A/THR disconnection
- The FMA displays the flashing THR LK message on the third line of the first column
- The ECAM alert ENG THRUST LOCKED appears every 5 s.

The thrust lock deactivates as soon as the flight crew moves the thrust levers.

A/THR ANNUNCIATION AND WARNINGS

Applicable to: ALL

Ident.: DSC-22_30-50-40-B-00025383.0001001 / 18 MAY 22

STANDARD DISCONNECTION

In the case of a standard disconnection (*Refer to DSC-22_30-50-40 A/THR Disconnection*), all the following occur:
- The ECAM alert AUTO FLT A/THR OFF appears
  L2 The maximum duration is 9 s
- L1 The MASTER CAUT light comes on
  L2 The maximum duration is 3 s
- L1 The single chime sounds.

The flight crew can press the A/THR instinctive disconnect pb, or the MASTER CAUT light to clear all the associated indicators.

Note: *If the aircraft is below 50 ft RA, and the flight crew sets all thrust levers to IDLE, no alert appears.*

Ident.: DSC-22_30-50-40-B-00025384.0001001 / 18 MAY 22

NON-STANDARD DISCONNECTION

In the case of a non-standard disconnection (*Refer to DSC-22_30-50-40 A/THR Disconnection*), all the following occur:

- The ECAM alert AUTO FLT A/THR OFF appears
- The MASTER CAUT light comes on
- The single chime sounds.

The alerts disappear if the flight crew:

- Presses the A/THR instinctive disconnect pb, or
- Presses the MASTER CAUT pb, or
- Arms or activates the A/THR.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-50-50-00025386.0001001 / 18 MAY 22
Applicable to: ALL

When the A/THR is active, an A/THR mode is engaged.
The A/THR modes are: THRUST, SPEED/MACH, RETARD and ALPHA FLOOR.

THRUST MODE

Ident.: DSC-22_30-50-50-00025387.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR is in THRUST mode if the engaged vertical AP/FD modes is SRS TO, OP CLB, CLB, OP DES, DES, or SRS GA in idle path. The target thrust depends on the engaged THRUST mode and can be limited by the thrust lever position, if the thrust levers are below the CL detent (AEO) or the FLX-MCT detent (OEI).
The following table shows the engagement conditions of the THRUST mode with the associated target thrust :

THRUST mode (Displayed on FMA)	Engagement Conditions (1)	Target Thrust
THR CLB	All of the following conditions are applicable: - SRS TO, CLB, OP CLB, EXP CLB ◁ or SRS GA is engaged, and - The most forward thrust lever is set to CL detent.	CLB
THR MCT	All of the following conditions are applicable: - SRS TO, CLB, OP CLB, EXP CLB ◁ or SRS GA is engaged, and - The most forward thrust lever is set to MCT detent, and - One engine is inoperative.	MCT
THR IDLE	DES, OP DES, EXP DES ◁ or the A/THR RETARD mode is engaged.	IDLE
THR LVR	One of the following conditions is applicable: - All thrust levers are below CL detent, and SRS TO, CLB, OP CLB, EXP CLB ◁ or SRS GA is engaged, or - The most forward thrust lever is between CL and MCT detents, and SRS TO, CLB, OP CLB, EXP CLB ◁ or SRS GA is engaged.	Thrust corresponding to thrust levers position

(1) *The thrust lever position refers to the thrust lever of operative engines. The thrust lever of an inoperative engine should be at the IDLE detent.*

SPEED/MACH MODE

Ident.: DSC-22_30-50-50-A-00025388.0001001 / 18 MAY 22
Applicable to: ALL

The SPEED or MACH mode of the A/THR adjusts the thrust to acquire and maintain a target speed or Mach.

The A/THR is in SPEED or MACH mode if one of the following AP/FD vertical modes is engaged:
- V/S / FPA, or
- Altitude capture and hold modes: ALT*, ALT, ALT CST*, ALT CST, ALT CRZ*, ALT CRZ, or
- DES in geometric path, or
- Approach modes: G/S*, G/S, F-G/S* ◁✻ , F-G/S ◁✻ , FINAL APP, or
- AP/FD TCAS ◁✻ .

If all APs and all FDs are disengaged and the A/THR is active, the A/THR is in SPEED/MACH mode.

Ident.: DSC-22_30-50-50-A-00025389.0001001 / 18 MAY 22
Applicable to: ALL

The speed/Mach target is:
- **Selected** if the target comes from the SPD/MACH value that the flight crew selects on the FCU
- **Managed** if the target comes from the FMS.

When in SPEED or MACH mode, the A/THR does not allow speed excursions beyond the following limits, regardless of the target speed or Mach number:
- As a maximum speed VMAX in high lift configuration, VMAX - 5 kt in clean configuration
- As a minimum speed:
  - For a selected speed target, VLS
  - For a managed speed target, the maneuvering speed of the current slats/flaps configuration (VAPP, F, S, GD).

Ident.: DSC-22_30-50-50-A-00025390.0001001 / 18 MAY 22
Applicable to: ALL

Note: *The changeover from SPEED to MACH or vice versa can be done automatically by the FMGC or manually by the flight crew by pressing the SPD/MACH pb on the FCU.*

Ident.: DSC-22_30-50-50-A-00025391.0001001 / 18 MAY 22
1 **Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 02924-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

A/THR APPROACH MODE

Below 3 200 ft RA, with at least CONF 1, the A/THR behavior is optimized:

- Above 150 ft RA, to be more responsive to speed variations
- Below 150 ft RA, to be less responsive to speed variations. This logic exists to avoid large thrust increases during the lower segment of the approach that may lead to destabilization and possible long flare.

RETARD MODE

Ident.: DSC-22_30-50-50-00025393.0001001 / 18 MAY 22
Applicable to: ALL

The A/THR RETARD mode is only available during an automatic landing.

The RETARD mode engagement occurs as follows:
1. At least one AP is engaged. LAND and A/THR SPEED mode are engaged
2. FLARE engages
3. When the aircraft reaches approximately 30 ft RA, the A/THR RETARD mode automatically engages. The FMA displays THR IDLE and the A/THR sets the thrust to idle
4. A RETARD callout triggers at 10 ft RA, asking the flight crew to set the thrust levers to the IDLE detent
5. The flight crew sets the thrust levers to IDLE detent: The A/THR disconnects, and the RETARD mode disengages.

If the last AP disengages when RETARD is engaged, RETARD disengages, and SPEED engages.

Note: *In manual landing, the RETARD callout triggers at 20 ft RA.*

In manual or automatic landing, the RETARD callout triggers, independently of the thrust levers position (*Refer to DSC-22_30-40-120-80 ILS Approach and Autoland*).

A/THR MODE REVERSIONS

Ident.: DSC-22_30-50-50-00025368.0001001 / 18 MAY 22
Applicable to: ALL

The following table presents the A/THR mode reversions:

Initial A/THR Mode	A/THR Mode after Reversion	Conditions Leading to A/THR Mode Reversion	Warning
THRUST	SPEED/MACH	The aircraft does not follow the speed target: - The aircraft speed is below VLS - 2 kt when DES, OP DES or EXP DES ◁✳ is engaged, or - The aircraft speed is above VMAX + 4 kt when CLB , OP CLB or EXP CLB ◁✳ is engaged. Note: *If the FD is engaged, the FD also disengages.*	A triple click audio indicator sounds. If the aircraft speed goes above VMAX + 4 kt, the OVERSPEED alert triggers.
Whatever A/THR mode. The A/THR can be armed, active, or disconnected.	A.FLOOR	*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*	*Refer to DSC-22_30-50-50 ALPHA FLOOR*

ALPHA FLOOR

Ident.: DSC-22_30-50-50-00025394.0002001 / 18 MAY 22

2 **Applicable to: MSN 10949-11597**

ALPHA FLOOR is a protection that commands TOGA thrust, regardless of the position of the thrust levers. This protection is available from lift-off to 100 ft RA on approach.
When ALPHA FLOOR conditions are met, the FMA displays A.FLOOR surrounded by a flashing amber box and the EWD displays A.FLOOR.

When ALPHA FLOOR conditions are no longer applicable and the speed is above VLS:
- If the A/THR was not active before A.FLOOR mode engagement, the thrust reverts to manual thrust. The level of thrust is set in accordance with the position of the thrust levers.
- If the A/THR was active before A.FLOOR mode engagement, the thrust reverts to the A/THR mode which corresponds to the current AP/FD.

For more information on the ALPHA FLOOR activation and inhibition conditions, *Refer to DSC-27-20-10-20 Protections - General*.

ALPHA FLOOR

Ident.: DSC-22_30-50-50-00025394.0001001 / 18 MAY 22

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324

ALPHA FLOOR is a protection that commands TOGA thrust, regardless of the position of the thrust levers. This protection is available from lift-off to 100 ft RA on approach.

When ALPHA FLOOR conditions are met, the FMA displays A.FLOOR surrounded by a flashing amber box and the EWD displays A.FLOOR.

When ALPHA FLOOR conditions are no longer applicable and the speed is above VLS:
- The FMA displays TOGA LK surrounded by a flashing amber box,
- The TOGA thrust is frozen.

To cancel A.FLOOR or TOGA LK, the flight crew must disconnect the autothrust.
For more information on the ALPHA FLOOR activation and inhibition conditions, *Refer to DSC-27-20-10-20 Protections - General*.

Intentionally left blank

FROM TAKEOFF TO THRUST REDUCTION ALTITUDE

Ident.: DSC-22_30-50-60-00025349.0001001 / 18 MAY 22
Applicable to: ALL

The aircraft is on ground, and the flight crew performs a takeoff with no selected FLX TO temperature, or DRT TO level (Derated Takeoff ◁) in the PERF TAKEOFF page:

1. The thrust levers are in the IDLE detent
2. The flight crew sets the thrust levers to TOGA:
   - A/THR arms
   - The engines thrust increases to TOGA
   - MAN TOGA appears on the FMA
   - SRS TO engages.
3. When the aircraft reaches the thrust reduction altitude, LVR CLB flashes
4. The flight crew sets the thrust levers to the CL detent:
   - A/THR activates
   - THRCLB appears on the FMA.

FROM SOFT GO-AROUND TO THRUST REDUCTION ALTITUDE

Ident.: DSC-22_30-50-60-00025350.0001001 / 03 NOV 22

1 **Applicable to: MSN 08495-09324, 10949-11597**

The flight crew performs a soft go-around when the thrust levers are set to TOGA then to FLX-MCT detent:

1. The flight crew sets the thrust levers to the TOGA detent:
   - A/THR arms
   - The engines thrust increases to TOGA

- MAN TOGA appears on the FMA
- SRS GA vertical mode engages on the FMA.

2. Then, the flight crew sets the thrust levers to the FLX-MCT detent:
   - A/THR remains armed
   - The engines apply a computed thrust to target a vertical speed of approximately 2 300 ft/min, or TOGA if 2 300 ft/min cannot be reached
   - MAN GA SOFT appears on the FMA
   - SRS GA vertical mode remains engaged.
3. When the aircraft reaches the thrust reduction altitude, LVR CLB flashes, and the flight crew sets the thrust levers to the CL detent:
   - A/THR activates
   - THR CLB appears on the FMA.

Note:
- *The soft go-around function is only available with both engines operative. Therefore, if one engine is inoperative, the flight crew must apply and keep TOGA during go-around. Then, to activate the climb phase, the flight crew must set the thrust levers to the FLX-MCT detent.*
- *If an engine failure occurs when the soft go-around function is engaged, LVR TOGA flashes on the FMA.*

GENERAL

Ident.: DSC-22_30-60-10-00025742.0001001 / 18 MAY 22
Applicable to: ALL

The speed/Mach control is:
- Managed, when the target comes from the FMS
- Selected, when the target comes from the SPD/MACH FCU window.

In flight, either the AP/FD pitch control or the A/THR may acquire and hold a target speed or Mach number, according to the engaged modes.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-60-20-00025743.0001001 / 18 MAY 22
Applicable to: ALL

When the speed target is managed, the SPD/MACH window of the FCU shows dashes, and the corresponding dot is lighted. The PFD speed scale shows the speed target in magenta.
For more information on the Speed/Mach Control Area, *Refer to DSC-22_10-40-20 Speed/Mach Control Area*.
For more information on the PFD Airspeed Indications, *Refer to DSC-31-40 Airspeed*.

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-20-00025744.0001001 / 18 MAY 22
Applicable to: ALL

The SPD target is managed whenever AP or FD is engaged and one of the following occurs:
- On ground, when V2 is inserted in the PERF TAKEOFF page, or

Note: At takeoff, SRS TO will not engage if V2 is not available.

- The SRS TO or SRS GA is engaged, or
- The flight crew pushes the SPD/MACH knob on the FCU, and a managed speed/Mach target is available, or
- The EXP CLB ◁ or EXP DES ◁ is engaged, or
- The AP/FD TCAS ◁ mode is engaged.

Note:
1. *If all the APs and FDs are off, the managed speed/Mach is only available when the flight phase of the FMS is the approach phase. The A/THR is then in SPEED mode.*
2. *The flight crew may insert a speed/Mach in the PERF DES page to replace the ECON DES SPD.*
   In this case, although the value is entered by the flight crew, this speed target is still managed and is taken into account to compute the top of descent and the descent profile.

MANAGED SPEED/MACH TARGET

Applicable to: ALL

Ident.: DSC-22_30-60-20-A-00025745.0002001 / 18 MAY 22

For managed speed/Mach, the lowest target is VLS, and the highest target is:
- VMAX in the case VMAX is equal to VFE, or
- VMAX - 5 kt in the case VMAX is equal to VMO/MMO.

When speed/Mach is managed, the target is defined as follows:

L123

AP/FD Engaged Mode or FMS Flight Phase	Managed Speed/Mach Target
SRS TO is engaged, and the aircraft is on ground.	V2
SRS TO is engaged, and the aircraft is airborne.	V2 + 10 kt *Note:* *However, the magenta triangle appears on the V2 value, on the PFDs.*
SRS TO is engaged, and one engine is out.	Memorized aircraft speed at engine-out detection. The target value is limited by V2 and V2 + 15 kt.
SRS GA is engaged.	Memorized aircraft speed at SRS GA engagement. The lower limit of the target is the VAPP memorized at 700 ft RA. The higher limit of the target is the lowest value between: - VLS + 25 kt (or VLS + 15 kt OEI) - VMAX - 5 kt.
- The FMS flight phase is the approach phase In this case, the APs and/or FDs may be on or off Or - F-G/S ◁✳ , G/S, LAND, FLARE or ROLL OUT is engaged	VAPP, corrected by the Ground Speed Mini function (*Refer to DSC-22_30-60-20 Ground Speed Mini Function*). Before reaching the landing configuration, the speed will not go below: - Green Dot, in clean configuration - S, in CONF 1 - F, in CONF 2 - F, in CONF 3, when CONF FULL is the landing configuration (as defined in the PERF APPR page). VAPP is memorized at 700 ft RA, so if the FMS loses the VAPP below 700 ft RA, the managed speed target will still be computed. The lower limit of the managed speed target is the VAPP that is computed by the FMS, and displayed on the MCDU. If the VAPP computed by the FMS is not available, the VAPP is VLS + 5 kt. The higher limit of the managed speed target is the VFE NEXT (or VFE - 5 kt in full configuration) of the landing configuration.
For all other cases	The managed speed/Mach target is provided by the FMS: - If NAV is engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. All the speed/Mach constraints are taken into account. - If NAV is not engaged, the managed speed/Mach target will be defined by the speed/Mach profile of the FMS flight plan. But the speed/Mach constraints are not taken into account. For information on the speed/Mach profile, *Refer to DSC-22_20-30-20-05 Flight Phases*.

Ident.: DSC-22_30-60-20-A-00025746.0001001 / 18 MAY 22

MANAGED SPEED TARGET MEMORIZATION

A dual FM failure has different consequences when it occurs in different phases of the flight.

The system handles target speed and SPD mode as follows:
- During approach with LOC and G/S, or F-LOC ◁ and F-G/S ◁ , or LOC and F-G/S ◁ , or LOC B/C ◁ and F-G/S ◁ engaged, and radio height <700 ft, the target speed is set to VAPP as previously memorized, and managed SPD target is maintained
- At go-around, the target speed becomes the memorized go-around speed, which is the higher of VAPP or the speed when go-around was initiated. Managed SPD target is maintained
- In all other cases, managed target speed reverts to selected, the value being the speed at the moment of the failure.

GROUND SPEED MINI FUNCTION

Ident.: DSC-22_30-60-20-B-00025747.0001001 / 18 MAY 22
Applicable to: ALL

GENERAL

When the aircraft flies an approach in managed speed, the managed speed target, displayed by the magenta triangle on the PFDs, is variable. This managed speed target is the VAPP, displayed on the PERF APPR page, corrected by the Ground Speed Mini function.

ACTIVATION CONDITIONS

The Ground Speed Mini function is active when:

- The speed is managed
- The FMS flight phase is the approach phase.

The Ground Speed Mini function does not correct Green Dot, S and F speeds.

PRINCIPLE

The Ground Speed Mini function takes advantage of the aircraft inertia when the wind varies during the approach in order to provide an appropriate indicated target speed (i.e. the managed target speed represented by the magenta triangle on the PFD). When the flight crew flies this indicated target speed, the energy of the aircraft is maintained above a minimum level that ensures standard aerodynamic margins versus the stall.
The minimum energy level is the energy level the aircraft will have at touchdown with an indicated airspeed equal to VAPP, and with the wind equal to the tower reported wind as inserted in the PERF APPR page. The ground speed then equals the Ground Speed Mini.
The Ground Speed Mini is not displayed to the flight crew.

During the approach, the FMGS continuously computes the managed target speed in order to keep the ground speed at or above the Ground Speed Mini.

Ident.: DSC-22_30-60-20-B-00025748.0001001 / 18 MAY 22
Applicable to: ALL

MANAGED SPEED TARGET COMPUTATION

The computation of the managed speed target uses the tower headwind component, the current headwind component, and the VAPP.

TOWER HEADWIND COMPONENT

The tower wind is the average wind provided by the ATIS or the tower. The flight crew enters the tower wind in the MAG WIND field in the PERF APPR page.
The tower headwind component is the projection of the MAG WIND on the runway axis. This computation is based on the runway inserted in the FMS active F-PLN.

CURRENT HEADWIND COMPONENT

The projection of the current wind measured by the ADIRS on the aircraft longitudinal axis is the current headwind component (instantaneous headwind).

Ident.: DSC-22_30-60-20-B-00025749.0002001 / 18 MAY 22
Applicable to: ALL

VAPP COMPUTATION

The FMS computes the VAPP, and displays it on the PERF APPR page. The VAPP computation takes into account the tower headwind component. VAPP is the highest of the following computations:

- VAPP = VLS + 1/3 x TWR HEADWIND COMPONENT, or
- VAPP = VLS + 5 kt.

Note: *"1/3 of the TWR HEADWIND COMPONENT" has 2 limits:*

- *0 kt as the minimum value (no wind or tailwind)*
- *+15 kt as the maximum value.*

The flight crew can manually modify the VAPP and the MAG WIND values on the PERF APPR page.

Ident.: DSC-22_30-60-20-B-00025750.0004001 / 18 MAY 22

1 **Applicable to: MSN 08495-09324, 10949-11597**

MANAGED SPEED TARGET COMPUTATION

The FG continuously computes the managed speed target that is equal to VAPP plus an additional increment. This increment takes into account the headwind variation during the final approach.

Managed speed target = VAPP + 1/3 x (CURRENT HEADWIND COMPONENT - TWR HEADWIND COMPONENT).

The managed speed target has the following limits:

- VAPP, as the minimum value
- VFE next, in CONF 0, 1, 2, 3, VFE - 5 kt in CONF FULL, as the maximum value.

Ident.: DSC-22_30-60-20-B-00025750.0002001 / 18 MAY 22

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-07098**

MANAGED SPEED TARGET COMPUTATION

The FG continuously computes the managed speed target that is equal to VAPP plus an additional increment. This increment takes into account the headwind variation during the final approach.

Managed speed target = VAPP + (CURRENT HEADWIND COMPONENT - TWR HEADWIND COMPONENT).

The managed speed target has the following limits:

- VAPP, as the minimum value
- VFE next, in CONF 0, 1, 2, 3, VFE - 5 kt in CONF FULL, as the maximum value.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-20-00025751.0001001 / 18 MAY 22

Applicable to: ALL

Managed speed disengages any time the flight crew selects a speed target on the FCU, or if the speed was preselected.

Intentionally left blank

GENERAL

Ident.: DSC-22_30-60-30-00025752.0001001 / 18 MAY 22
Applicable to: ALL

When the speed target is selected, the SPD/MACH window of the FCU displays this speed target. The PFD displays the associated speed target on the airspeed scale. The flight crew uses the knob on the FCU to set this speed target.
For more information on the Speed/Mach Control Area, *Refer to DSC-22_10-40-20 Speed/Mach Control Area*.
For more information on the PFD Airspeed Indications, *Refer to DSC-31-40 Airspeed*.

Note: *If the selected speed/Mach target is set below VLS or above VMAX, with the autothrust active, the FMGS automatically limits the speed to:*
- *VLS, or*
- *VMAX in the case VMAX is equal to VFE, or*
- *VMAX - 5 kt in the case VMAX is equal to VMO/MMO.*

Selected speed has priority over managed speed. The only automatic change-over from selected to managed speed target may occur at go-around mode engagement.
In flight, if the situation calls for managed speed, both the PFD and the MCDU display a message proposing a manual change to managed speed (for example SET MANAGED SPEED, CHECK SPEED MODE, SET HOLD SPEED).

ENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-30-00025753.0001001 / 18 MAY 22
Applicable to: ALL

The speed/Mach target becomes selected, if one of the following occurs:
- The flight crew pulls out the SPD/MACH knob (earliest 5 s after lift-off), or
- Both AP/FDs are OFF (except in APPR phase), or
- The FM speed target is lost except in SRS, G/S, LAND, or go-aound or,
- The MCDU has a preselected speed for the next phase, and the aircraft transitions into that phase, or
- The FMGC is powered up in flight, or
- The AP/FD TCAS mode due to a RA.

DISENGAGEMENT CONDITIONS

Ident.: DSC-22_30-60-30-00025754.0001001 / 18 MAY 22
Applicable to: ALL

The selected speed target disengages when:

- The managed speed target engages, or
- On ground at engine start.

Note: *It is not possible to activate selected speed mode on ground with engines running and FD ON until after takeoff.*

SPEED/MACH FCU WINDOW SYNCHRONIZATION

Ident.: DSC-22_30-60-40-00025755.0001001 / 18 MAY 22
Applicable to: ALL

However, the window of the FCU displays the target speed or MACH in the following situations:

- The flight crew turns the SPD/MACH knob.
  The value in the window first synchronizes with the current SPD/MACH, then displays the manual selection. It remains displayed for 10 s depending upon FCU standard, then reverts to dashes if the flight crew does not pull the knob
- The flight crew manually engages a selected SPD target
- If the flight crew has manually preselected that speed or Mach value for the next phase on the PERF page:
  - That preselected speed or Mach value engages when the aircraft enters that phase, and
  - The FCU window then displays this preselected speed or Mach as the target
- If the FMGS is powered up in flight, the synchronized speed/Mach value is the current aircraft speed or Mach
- If no V2 is entered at takeoff, the V/S mode engages 5 s after lift-off (no SRS TO). The FCU speed target is the speed at V/S mode engagement. (A/THR becomes active when the thrust levers are set in the active range).

Intentionally left blank

GENERAL

Ident.: DSC-22_30-70-A-00025834.0001001 / 18 MAY 22
Applicable to: ALL

The approach and landing capability provides the flight crew with the aircraft capability to perform an approach, and land the aircraft.
The FMA displays this capability.

The approach and landing capability depends on:
- The availability of aircraft systems,
- The type of approach selected on the ARRIVAL page.

For more information about the minimum required equipment to compute approach and landing capabilities, *Refer to QRH/OPS Required Equipment for CAT2 and CAT3*.

The approach and landing capability enables the flight crew to determine:
- The available minima of the approach
- The available landing technique.

Ident.: DSC-22_30-70-A-00025835.0001001 / 18 MAY 22
Applicable to: ALL

APPROACH AND LANDING CAPABILITY WITH ILS/GLS /SLS

Approach and Landing Capability	Type of Approach Selected	Available FMA Guidance	Lowest Available Minima	Aircraft Landing Capability

Note: *If the autoland capability is not available, the DISCONNECT AP FOR LDG message appears on the FMA when the aircraft is below 150 ft.*

FAIL CONCEPT

Ident.: DSC-22_30-70-00025839.0001001 / 18 MAY 22
Applicable to: ALL

FAIL-OPERATIONAL AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-operational if, in the event of a failure below alert height, the remaining part of the automatic landing system allows the aircraft to complete the approach, flare, and landing.
The CAT3 DUAL approach and landing capability is fail-operational automatic landing system.

Note: *In the event of a failure, the automatic landing system operates as a fail-passive system.*

FAIL-PASSIVE AUTOMATIC LANDING SYSTEM

An automatic landing system is fail-passive if, in the event of a failure, there is no significant out-of-trim condition, or deviation of flight path or attitude, but the landing is not completed automatically.

The following approach and landing capabilities are fail-passive automatic landing system.
- CAT3 SINGLE
- CAT2
- CAT1

Note: *With a fail-passive automatic landing system, the flight crew controls the aircraft after a failure.*

DISPLAY

Ident.: DSC-22_30-70-00025840.0001001 / 18 MAY 22
Applicable to: ALL

The approach and landing capability is displayed in the "Approach and Landing Capability" column of the FMA and of the HUD ◁ , when:
- An LS approach is manually or automatically selected on the ARRIVAL page
- The flight crew presses one of the following pushbutton on the FCU:
  - The LS pb, or
  - The LOC pb, or
  - The APPR pb.

The FMAs displays the approach and landing capability in accordance with the state of the aircraft systems, and the flight guidance systems that are engaged.

Note: *No approach and landing capability is displayed when an RNAV (RNP) approach is selected in the FMS.*

L2 If the FMGC is not able to compute the approach and landing capability, CAT 1 capability is displayed on the FMA, regardless of the FMS flight phase.

L1 APPROACH WITHOUT FLS ◁ FUNCTION

Depending on the approach selected, the CAT 1 approach and landing capability appears as soon as the flight crew presses one of the LS pb.
The computation of the CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability depends on the AP engagement. Therefore, when the flight crew presses the APPR pb to arm or engage the final approach mode, and one or both AP(s) is engaged then CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability can be displayed (both APs are necessary for CAT 3 DUAL).
However, if the North reference is TRUE, the CAT 1 is the only available capability.

L2 *Note:* 1. *CAT 1, CAT 2, CAT 3 SINGLE or CAT 3 DUAL approach and landing capability is computed only if the aircraft is above 400 ft when the flight crew arms the approach modes*

2. *Below 200 ft RA, CAT 3 SINGLE, or CAT 3 DUAL is memorized and remains displayed as long as:*
   - *At least one AP is engaged, and*
   - *LAND, FLARE, or ROLL OUT is engaged.*

L1 APPROACH WITH FLS ◁ FUNCTION

If the flight crew selects an approach with the FLS ◁ function, and the active FMS flight phase is CRZ, DES or APPR, the approach and landing capability appears as soon as the flight crew presses the LS pb.

AUTOLAND WARNING LIGHT

Ident.: DSC-22_30-80-10-00012386.0005001 / 18 MAY 22

1 **Applicable to: MSN 08635, 10949-11597**

The AUTOLAND warning flashes when:

- At least one AP is engaged below 200 ft with LOC and G/S armed, or with LOC, G/S, LAND or FLARE mode on the FMA and the difference between both RA indications is more than 15 ft RA, or
- At least one AP is engaged below 200 ft with LAND or FLARE mode on the FMA and one of the following conditions occurs:
  - The LOC deviation exceeds 1/4 dot and the aircraft is above 15 ft RA (the LOC scale flashes on the PFD), or
  - The GLIDE deviation exceeds 1 dot and the aircraft is above 100 ft RA (the GLIDE scale flashes on the PFD), or
  - Loss of LOC signal above 15 ft RA (the FD vertical bar flashes on the PFD), or
  - Loss of GLIDE signal above 100 ft RA (the FD horizontal bar flashes on the PFD), or
  - The last AP disengages, or
  - The FMGS detects a long flare, or
  - The FMGS detects an untimely flare condition.

L2 The FMGS detects an untimely flare condition when the time between LAND engagement (measured radio height is below 400 ft) and FLARE condition (measured radio height is below 50 ft) is less than 2 s.

AUTOLAND WARNING LIGHT

Ident.: DSC-22_30-80-10-00012386.0003001 / 18 MAY 22

2 **Applicable to: MSN 01459, 02924-03002, 03035-03211, 03266-03284, 03313-03565, 03630-03662, 03733, 04441-04544, 04734-04756, 04827-05342, 05591-05987, 06097, 06121, 06139-08596, 09190-09324**

The AUTOLAND warning flashes when:

- At least one RA indicates a height below 200 ft, and
- At least one AP is engaged with LAND or FLARE mode on the FMA, and
- At least one of the following conditions occurs:
  - The LOC deviation exceeds 1/4 dot and the aircraft is above 15 ft RA (the LOC scale flashes on the PFD), or
  - The GLIDE deviation exceeds 1 dot and the aircraft is above 100 ft RA (the GLIDE scale flashes on the PFD), or
  - Loss of LOC signal above 15 ft RA (The FD vertical bar flashes on the PFD), or
  - Loss of GLIDE signal above 100 ft RA (The FD horizontal bar flashes on the PFD), or
  - The difference between both RA indications is greater than 15 ft RA, or
  - The last autopilot disengages, or
  - The FMGS detects a long flare, or
  - The FMGS detects an untimely Flare condition.

L2 The FMGS detects an untimely Flare condition when the time between LAND engagement (measured radio height is below 400 ft) and FLARE condition (measured radio height is below 50 ft) is less than 2 s.

AUTOLAND WARNING LIGHT

Ident.: DSC-22_30-80-10-00012386.0002001 / 09 APR 15

3 **Applicable to: MSN 01376, 01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528**

The AUTOLAND warning flashes when:
- At least one RA indicates a height below 200 ft, and
- At least one AP is engaged with LAND or FLARE mode on the FMA, and
- At least one of the following conditions occurs:
  - The LOC deviation exceeds 1/4 dot and the aircraft is above 15 ft RA (the LOC scale flashes on the PFD), or
  - The GLIDE deviation exceeds 1 dot and the aircraft is above 100 ft RA (the GLIDE scale flashes on the PFD), or
  - Loss of LOC signal above 15 ft RA (The FD vertical bar flashes on the PFD), or
  - Loss of GLIDE signal above 100 ft RA (The FD horizontal bar flashes on the PFD), or
  - The difference between both RA indications is greater than 15 ft RA, or
  - The last autopilot disengages, or
  - The FMGS detects a long flare.

AUTOLAND WARNING LIGHT

Ident.: DSC-22_30-80-10-00012386.0001001 / 03 JUN 14

4 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

The following situations, when occurring below 200 ft RA with the aircraft in LAND mode, trigger the flashing Autoland red warning:
- Both APs OFF below 200 ft RA.
- Excessive deviation in LOC (1/4 dot above 15 ft RA) or GLIDE (1 dot above 100 ft RA). In addition, LOC and GLIDE scales flash on the PFD.
- Loss of LOC signal above 15 ft, or loss of GLIDE signal above 100 ft. The FD bars flash on the PFD. The LAND mode remains engaged.
- The difference between both radio altimeter indications is greater than 15 ft.

Intentionally left blank

FMA DISPLAY

32 **Applicable to: MSN 10949-11597**

FMA Display	MACH with a flashing amber box
Column	A/THR Messages and Modes - Column 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	A/THR is active while overspeed conditions are met.

MACH SEL:.XX

Ident.: DSC-22_30-80-20-00025640.0001001 / 18 MAY 22

Applicable to: ALL

FMA Display	MACH SEL:.XX
Column	Special Messages - Column 1 and 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	Indicates a preset Mach associated with the cruise, climb or descent phase.

MAN FLX XX

Ident.: DSC-22_30-80-20-00025771.0001001 / 18 MAY 22

Applicable to: ALL

FMA Display	MAN FLX XX with a permanent white box
Column	A/THR Messages and Modes - Column 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 and 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	A/THR is armed, at least one thrust lever is in FLX/MCT detent, with FLX TO temperature (displayed in blue), set by the flight crew in the PERF TAKEOFF page. The related engine apply flexible thrust, with FLX TO temperature set by the flight crew. The other thrust lever is at, or below the FLX/MCT detent.

MAN GA SOFT

Ident.: DSC-22_30-80-20-00025641.0001001 / 18 MAY 22
33 **Applicable to: MSN 08495-09324, 10949-11597**

FMA Display	MAN GA SOFT with a permanent white box
Column	A/THR Messages and Modes - Column 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 and 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	A/THR is armed, at least one engine is in soft go-around thrust and the thrust levers are above the CL detent and at or below the FLX-MCT detent. The soft go-around thrust mode engages if all the following conditions are applicable when the flight crew sets the thrust levers to TOGA, then to the FLX-MCT detent during the go-around: - All engines are operative - The slats/flaps are extended - The aircraft is below the go-around thrust reduction altitude, and below 16 000 ft - The aircraft is in flight and not performing a touch and go. *Note:* *The soft go-around function remains operative on the operative engine, and MAN GA SOFT is still displayed if one of the following occurs:* - *One engine fails, or* - *One thrust lever is set to idle position, or* - *One engine is not in soft go-around thrust mode. However, LVR TOGA appears and requests the flight crew to set the thrust lever of the operative engine to the TOGA detent.*

MAN MCT

Ident.: DSC-22_30-80-20-00025642.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	MAN MCT with a permanent white box
Column	A/THR Messages and Modes - Column 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 and 2 - (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	A/THR is armed, at least one thrust lever is in FLX/MCT detent. The other thrust levers are at, or below this detent and no FLX TO temperature, nor a Derated Takeoff ◁ level is entered.

MAN PITCH TRIM ONLY

Ident.: DSC-22_30-80-20-00025643.0001001 / 18 MAY 22
Applicable to: ALL

FMA Display	MAN PITCH TRIM ONLY
Column	Special Messages - Column 2 and 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 3 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	Displayed in case of loss of L + R elevators.

MAN THR

Column	AP/FD Vertical Modes - Column 2 (*Refer to DSC-22_30-80-20 FMA Display*)
Line	Line 1 (*Refer to DSC-22_30-80-20 FMA Display*)
Display Conditions	The Vertical Speed mode is engaged to acquire and maintain the V/S selected on the FCU. The target is displayed in blue. If the aircraft reaches VLS or VMAX and cannot maintain the target, the indication is boxed amber and flashes, and the target pulses.

Intentionally left blank

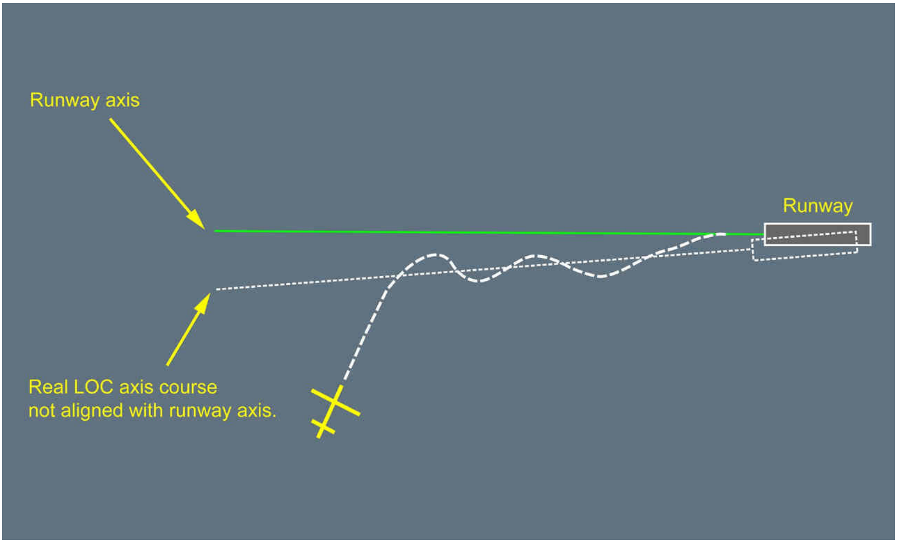
MISBEHAVIOUR OF THE ENHANCED LOC CAPTURE FUNCTION

Ident.: DSC-22_30-110-00023202.0001001 / 10 MAY 21
Applicable to: ALL

DESCRIPTION

With the Enhanced LOC capture function, the aircraft may oscillate on one side of the LOC axis when one of the following occurs:

- The LOC ground antenna position is unusual (ahead of runway threshold or not aligned with runway axis), or
- The LOC course is not aligned with runway axis.



OPERATIONAL RECOMMENDATION

On runway with unusual LOC position or with LOC course not aligned with runway axis, in case of roll oscillations during LOC capture, the flight crew shall consider to discontinue the approach. On the next approach, the flight crew must manually tune the ILS via the RMP before arming the APPR mode (or the LOC mode).

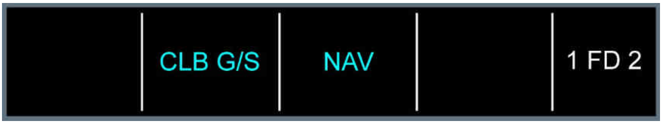
UNEXPECTED G/S MODE ARMED

Ident.: DSC-22_30-110-00022028.0001001 / 12 JUL 18
Applicable to: ALL

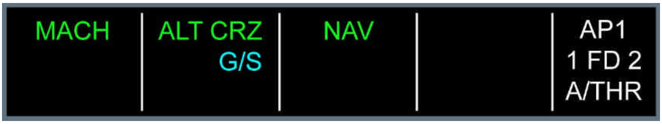
During the approach phase with Glide Slope (G/S) mode armed (displayed blue on Flight Mode Annunciator (FMA)), the Flight Guidance may not disarm the G/S mode if the following conditions are satisfied in a time frame of less than 1.5 s:
- AP1+2 set to OFF
- FD1+2 set to OFF
- A/THR set to OFF.

As expected, AP/FDs are OFF and G/S mode is correctly disarmed (G/S mode no longer displayed on FMA). However, regardless of the subsequent flight phases (go-around, new approach, take-off, etc), the G/S mode will arm again as soon as the FDs are back to ON. G/S mode armed is displayed in addition to the current vertical mode armed.
The following three illustrations provide non exhaustive examples of unexpected G/S mode armed:

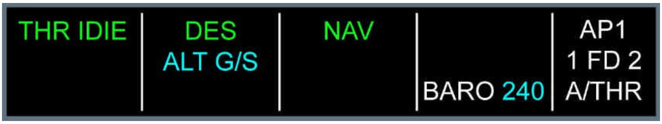
Example of FMA During Cockpit Preparation:



Example of FMA during Cruise:



Example of FMA During Descent:



On ground, misbehavior cancel sequence:
With FDs ON, if G/S is armed, the flight crew shall perform an aircraft power OFF.

In flight, misbehavior cancel sequence:

- Push the FCU APPR push-button to arm the approach modes, confirmed by both LOC and G/S displayed blue on FMA. To do so the arming conditions for approach modes must be satisfied.
- Push again the FCU APPR push-button to disarm the approach modes, confirmed by both LOC and G/S no longer displayed on FMA.

OPERATIONAL RECOMMENDATIONS:

If the misbehavior occurs during the flight, and an approach with FCU LOC push-button is required (LOC only procedure or ILS approach with early LOC interception requested by Air Traffic Control (ATC)), **first perform** the above-mentioned **In flight misbehavior cancel sequence** to remove the G/S mode armed. Then the approach can be flown as usual.

LEFT TURN NOT EXPECTED WHILE IN HDG OR TRK MODE

Ident.: DSC-22_30-110-00015029.0001001 / 08 AUG 13

1 **Applicable to: MSN 01143-01251, 01801, 01826, 01855**

The AP/FD may erroneously order a left turn if the following conditions are fulfilled:

- The aircraft is in a right turn in HDG or TRK mode
- Within 180 ms, the difference between the target selected on the FCU and the current aircraft heading/track, initially above 85 °:
  1. First goes below 85 °
  2. Then goes above 95 °.

The flight crew may encounter this misbehavior in two different situations:

- The flight crew requests a right turn, then rapidly reduces and increases again the target selected on the FCU
- The flight crew increases the target selected on the FCU according to the above conditions, while the aircraft is already in a right turn.

The misbehavior may affect either one AP/FD or both AP/FD.

OPERATIONAL RECOMMENDATIONS:

The flight crew must immediately take appropriate actions:

- The flight crew must disconnect the AP and the FD, and manually turn.
- When established on the intended trajectory, the flight crew can reengage the FD first, and then the AP.

SPURIOUS CAT 2 INOP

Ident.: DSC-22_30-110-00022057.0001001 / 10 MAY 21

2 **Applicable to: MSN 01376, 01518, 01593-01628, 01825, 01832, 01837, 02014-02321, 02734-03710, 03733-05752, 06895**

DESCRIPTION:

A spurious CAT 2 INOP SYS may occur on ground or in flight.

- On ground, a CAT 2 INOP SYS may be displayed without additional ECAM alert
- In flight, a CAT 2 INOP SYS may be displayed with the NAV LS TUNING DISAGREE alert, while there is no real landing system tuning disagree.

Note: *The case of spurious CAT 2 INOP SYS in flight may occur at the recovery from an FMGC reset, or when the flight crew uses the RMP to tune an ILS frequency/ILS course.*

A spurious CAT 2 INOP SYS is caused by the erroneous detection of a difference in ILS tuning between FMGC1 and FMGC2.

OPERATIONAL RECOMMENDATIONS:

If a CAT 2 INOP SYS is displayed on ground or in flight as indicated in the description above, the flight crew shall perform all of the following:

- On RADNAV page of any FMS, insert the following ILS frequency/ILS course: 108.0/0 °
- Check that CAT 2 no longer appears on the ECAM INOP SYS
- Clear the ILS frequency/ILS course insertions from RADNAV page.

Note: *1. 108.0/0 ° is the default value of ILS frequency/ILS course for the FMS.*
2. Clearing ILS insertions on RADNAV page restores the automatic NAVAID tuning.

Intentionally left blank

GENERAL

Ident.: DSC-22_40-10-00000840.0001001 / 24 FEB 15
Applicable to: ALL

The aircraft has two flight augmentation computers (FACs) that perform four main functions:

- Yaw function
  - Yaw damping and turn coordination
  - Rudder trim
  - Rudder travel limitation
- Flight envelope function
  - PFD speed scale management
    - Minimum/maximum speed computation
    - Maneuvering speed computation
  - Alpha-floor protection
- Low-Energy Aural Alert function ◁
- Windshear detection function ◁

In performing these functions the FAC uses independent channels :
Yaw damper
Rudder trim
Rudder travel limit
Flight envelope

Each FAC interfaces with the elevator aileron computers (ELACs) when the APs are disengaged, or with the FMGS when at least one AP is engaged.
Both FACs engage automatically at power-up.
The pilot can disengage or reset each FAC (in case of failure) by means of a pushbutton on the flight control overhead panel.
When a FAC is disengaged (FAC pushbutton set off) but still valid, the flight envelope function of the FAC remains active.
If both FACs are valid, FAC1 controls the yaw damper, turn coordination, rudder trim, and rudder travel limit, and FAC2 is in standby.
FAC1 keeps the aircraft within the flight envelope through FD1 ; FAC2 performs this function through FD2.
If a failure is detected on any channel of FAC1, FAC2 takes over the corresponding channel.

Intentionally left blank

YAW DAMPING

Ident.: DSC-22_40-20-00000851.0001001 / 18 MAR 11
Applicable to: ALL

Yaw damping stabilizes the aircraft in yaw and coordinates its turns.
In automatic flight (AP engaged) during takeoff and go around, it assists rudder application after an engine failure (short-term yaw compensation).

Note: *When the AP is engaged, the FMGS sends orders to the FAC to give :*
- *Yaw damping during approach*
- *Yaw control for runway alignment in ROLL OUT mode*

RUDDER TRIM

Ident.: DSC-22_40-20-00000855.0001001 / 09 DEC 09
Applicable to: ALL

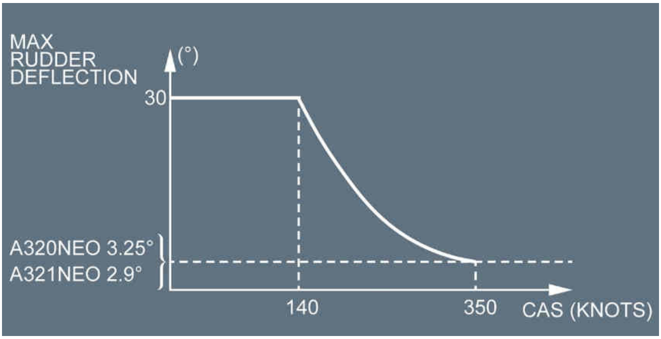
The rudder trim function :
- Executes trim orders, entered by the pilot by using the manual trim knob.
- When AP is engaged
  - ■ executes trim orders from the FMGS.
  - ■ Assists the system in recovering from engine failure (long-term yaw compensation) in all flight guidance modes.
  - ■ If the pilot pushes the rudder more than 10 ° out of trim, it disengages the AP.

Note: *When the AP is engaged, the rudder trim knob is inoperative : the master FMGC sends rudder trim orders to the FAC.*

RUDDER TRAVEL LIMITATION

Ident.: DSC-22_40-20-00000857.0004001 / 28 MAY 20
1 **Applicable to: MSN 08495-09324, 10949-11597**

This function limits rudder deflection is based on speed in order to avoid high structural loads. It is governed by the following law :

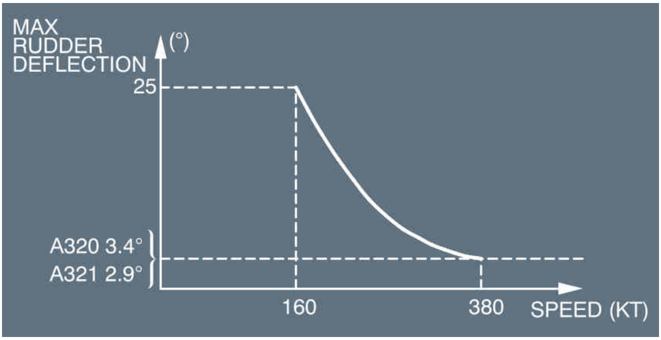


If both FACs lose the rudder travel limitation function, the value of the rudder deflection limit is locked at the time of the second failure.
When the slats are extended, the FACs automatically set the rudder deflection limit at the low-speed setting (maximum authorized deflection).

RUDDER TRAVEL LIMITATION

Ident.: DSC-22_40-20-00000857.0001001 / 01 OCT 12
Applicable to: MSN 01143-01518, 01593-01628, 01825, 01832, 02014, 02734, 02896-03002, 03035-03565, 03630-03662, 03761-03816, 04352-04358, 04441-04544, 04570-04662, 04827-04974, 05066, 05101-05342, 05528-05987, 06097, 06121, 06139-07098

This function limits rudder deflection is based on speed in order to avoid high structural loads. It is governed by the following law :



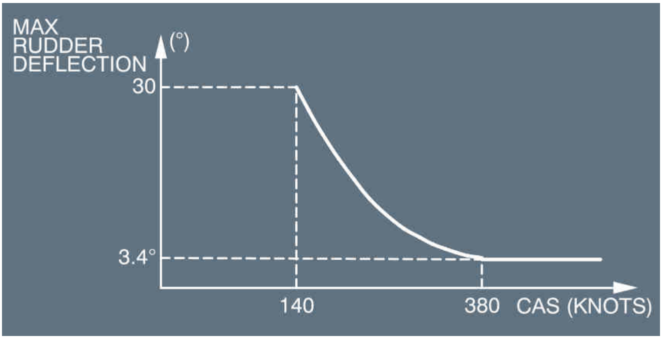
If both FACs lose the rudder travel limitation function, the value of the rudder deflection limit is locked at the time of the second failure.
When the slats are extended, the FACs automatically set the rudder deflection limit at the low-speed setting (maximum authorized deflection).

RUDDER TRAVEL LIMITATION

Ident.: DSC-22_40-20-00000857.0003001 / 01 OCT 12

Applicable to: MSN 01801, 01826, 01837-01855, 02321, 02887, 03032, 03588-03595, 03710, 03733, 04000-04192, 04389, 04563, 04734-04773, 05005, 05097, 05345

This function limits rudder deflection is based on speed in order to avoid high structural loads. It is governed by the following law :



If both FACs lose the rudder travel limitation function, the value of the rudder deflection limit is locked at the time of the second failure.

When the slats are extended, the FACs automatically set the rudder deflection limit at the low-speed setting (maximum authorized deflection).

Intentionally left blank

GENERAL

Ident.: DSC-22_40-30-00000859.0001001 / 09 DEC 09
Applicable to: ALL

As long as one Flight Augmentation Computer (FAC) is valid, it governs the flight envelope function, the rudder position display, and the rudder trim indication regardless of what the flight crew does with the FAC pushbutton.

PFD SPEED SCALE MANAGEMENT

Ident.: DSC-22_40-30-00000860.0001001 / 10 MAY 21
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05240, 05345

The FAC controls the speed scale on the PFD (*Refer to DSC-31-40 Attitude Data*).
When both FACs are operative, FAC1 supplies data to PFD1 and FAC2 supplies it to PFD2.

The FAC computes:
- The minimum and maximum speeds:
  - VSW
  - VLS
  - VFE and VFE for the next configuration
  - VLE
  - VMO/MMO.
- The maneuvering speeds:
  - Green Dot Speed
  - S speed
  - F speed.

The FAC also computes the speed trend and displays it as an arrow on the PFD speed scale.
The PFD displays these various speeds as appropriate, and they also go to the FMGC to be used as limits for various guidance modes.

Note: *The principle of the speed computation is as follows:*
- *The FAC computes VS1G. From VS1G it computes the FAC GW which is also sent to the ELAC:*
  - *When the aircraft is below 14 625 ft and 250 kt, it computes this from current angle of attack, speed/Mach, altitude, thrust, and CG*
  - *When the aircraft is above 14 625 ft or 250 kt, it computes this out of the GW, which it has memorized and updated with a fuel consumption model set in the FAC.*
- *The FAC computes the various minimum and maneuvering speeds, Vα prot and VSW*
- *The accuracies of the various minimum and maximum speeds are functions of the accuracy with which the FAC computes aircraft gross weight. Normal accuracy for VLS in CONF FULL is about ± 3 kt.*

PFD SPEED SCALE MANAGEMENT

Ident.: DSC-22_40-30-00000860.0002001 / 10 MAY 21

1 **Applicable to: MSN 05342, 05528-05987, 06097, 06121, 06139-09324, 10949-11597**

The FAC controls the speed scale on the PFD (*Refer to DSC-31-40 Attitude Data*).
When both FACs are operative, FAC1 supplies data to PFD1 and FAC2 supplies it to PFD2.

The FAC computes:
- The minimum and maximum speeds:
  - VSW
  - VLS
  - VFE and VFE for the next configuration
  - VLE
  - VMO/MMO.
- The maneuvering speeds:
  - Green Dot Speed
  - S speed
  - F speed.

The FAC also computes the speed trend and displays it as an arrow on the PFD speed scale.
The PFD displays these various speeds as appropriate, and they also go to the FMGC to be used as limits for various guidance modes.

Note: *The FAC computes the operating speeds based on the FMS gross weight. This allows to have consistent and accurate operating speeds between the PFD and the MCDU. In parallel, the FAC also computes its own GW and CG, based on aerodynamic data, which is used by the ELAC and the FMS for gross weight crosscheck (CHECK GW MCDU message), and as a backup for speeds computation in the case of dual FMS failure. The principle of the FAC GW/CG computation based on aerodynamic data is as follows:*

- *The FAC computes VS1G. From VS1G it computes the FAC GW which is also sent to the ELAC:*
  - *When the aircraft is below 14 625 ft and 250 kt, it computes this from current angle of attack, speed/Mach, altitude, thrust, and CG*
  - *When the aircraft is above 14 625 ft or 250 kt, it computes this out of the GW, which it has memorized and updated with a fuel consumption model set in the FAC.*

ALPHA-FLOOR PROTECTION

Ident.: DSC-22_40-30-A-00025190.0001001 / 18 MAY 22
Applicable to: ALL

GENERAL

The Alpha-floor function automatically applies TOGA thrust, when the angle of attack exceeds the Alpha-floor threshold (between αPROT and αMAX). TOGA thrust is applied regardless of the thrust lever position and the A/THR engagement status.
The A/THR engages in A.FLOOR mode. For more information on A.FLOOR A/THR mode, *Refer to DSC-22_30-50-50 ALPHA FLOOR*.

ALPHA-FLOOR PROTECTION ACTIVATION

The Alpha-floor function activates when one of the following conditions occurs:

- The angle of attack is above Alpha-floor (Alpha-floor depends on the aircraft configuration, and the aircraft deceleration rate), or
- The side stick deflection is close to full back stick, with either:
  - The pitch attitude protection active (*Refer to DSC-27-20-10-20 Protections - Pitch Attitude Protection*), or
  - The angle of attack protection active (*Refer to DSC-27-20-10-20 Protections - High Angle of Attack Protection*).

Ident.: DSC-22_40-30-A-00025194.0001001 / 05 MAY 22
Applicable to: ALL

ALPHA-FLOOR PROTECTION INHIBITION

The Alpha-floor protection is inhibited when one of the following conditions occurs:

- The AP/FD TCAS ◁ mode is engaged, or

Ident.: DSC-22_40-30-A-00025191.0001001 / 05 MAY 22
2 **Applicable to: MSN 01376-01459, 01593-01628, 01825, 02014-02321, 02734-03111, 03211-03284, 03313-03662, 03733-04563, 04662-04974, 05066, 05101-05987, 06097, 06121, 06139-06871, 06895-09324, 10949-11597**

- The aircraft airspeed is above M 0.6, or

Ident.: DSC-22_40-30-A-00025192.0001001 / 05 MAY 22
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-02904, 03032, 03222-03229, 03294, 03588-03595, 03710, 03761-04389, 04563-04662, 04773, 05345-05528, 05947-05987, 06097, 06121, 06163-06165

- Both FADEC are in N1 mode, or

Ident.: DSC-22_40-30-A-00025193.0001001 / 05 MAY 22
Applicable to: ALL

- One engine is inoperative with slats/flaps extended, or
- One EIU is failed, or
- Both SFCC1 and FMGC2 are failed, or
- Both SFCC2 and FMGC1 are failed, or
- Both FCU channels are failed, or
- Both FMGCs are failed, or
- Alternate or direct law is active.

LOW - ENERGY AURAL ALERT

Ident.: DSC-22_40-30-00006197.0001001 / 03 NOV 21
Applicable to: ALL

An aural low-energy “SPEED SPEED SPEED” alert, repeated every 5 s, warns the flight crew that the aircraft’s energy level is going below a threshold under which the flight crew has to increase thrust, in order to regain a positive flight path angle through pitch control.

It is available in Configuration 2, 3, and FULL. The FAC computes the energy level with the following inputs:

- Aircraft configuration
- Horizontal deceleration rate
- Flight path angle.

The aural alert is inhibited when:

- TOGA is selected, or
- Below 100 ft RA, or
- Above 2 000 ft RA, or
- Alpha-floor, or the ground proximity warning system alert is triggered, or
- In alternate or direct law, or
- If both radio altimeters fail.

During deceleration, the low-energy aural alert is triggered before alpha floor (unless alpha floor is triggered by stick deflection). The amount of time between the two alerts depends on the deceleration rate.

Intentionally left blank

WINDSHEAR DETECTION FUNCTION

Ident.: DSC-22_40-40-00006194.0001001 / 07 JUL 11
Applicable to: ALL

The windshear detection function is provided by the Flight Augmentation Computer (FAC) in takeoff and approach phase in the following conditions:
- At takeoff, 3 s after liftoff, up to 1 300 ft RA
- At landing, from 1 300 ft RA to 50 ft RA
- With at least CONF 1 selected.

The warning consists of:
- A visual “WINDSHEAR” red message displayed on both PFDs for a minimum of 15 s.
- An aural synthetic voice announcing “WINDSHEAR” three times.

WINDSHEAR DETECTION PRINCIPLES

Ident.: DSC-22_40-40-00006195.0001001 / 23 JUN 15
Applicable to: ALL

The FACs generate the windshear warning whenever the predicted energy level for the aircraft falls below a predetermined threshold.
In computing this energy level prediction, the FACs use data from different sources. From ADIRS comes data such as vertical speed, air and ground speeds and slope ; from other sources come such derived parameters as total slope, longitudinal wind gradient, and vertical wind.
The FACs express this energy level as an angle of attack and compare it with an angle-of-attack threshold above which windshear conditions are most likely and pilot action is required.

GENERAL

Ident.: DSC-22_45-00000864.0001001 / 18 MAR 11

1 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The FMS AOC function gives an interface between a ground station and one onboard FMGC, allowing data transmission between these two computers via the ACARS Management Unit or the ATSU.

Two different sets of message can be exchanged:
UPLINK messages from the ground station. They consist in reception of data requested or directly sent to the crew.
DOWNLINK messages from the FMGC (master). They consist in reports or requests sent to the ground station.

The FMGS/ACARS or FMGS/ATSU interface enables the following AOC capabilities.
- F-PLN initialization (flight plan and performance data)
- Takeoff data
- Wind data
- Flight reports
- Broadcast data

Crews can send message using ACARS FUNCTION pages or relevant MCDU pages.
Only one FMGC talks to the ground station. This FMGC is called FMGC “master”.

GENERAL SCRATCHPAD MESSAGES

NOT XMITTED TO ACARS:	A crew request or report was sent to the ground but the communication was not established or not acknowledged.
NO ANSWER TO REQUEST :	A crew request was previously sent to the ground and no answer (uplink message) was received within 4 min.

FLIGHT PLAN INITIALIZATION FUNCTION

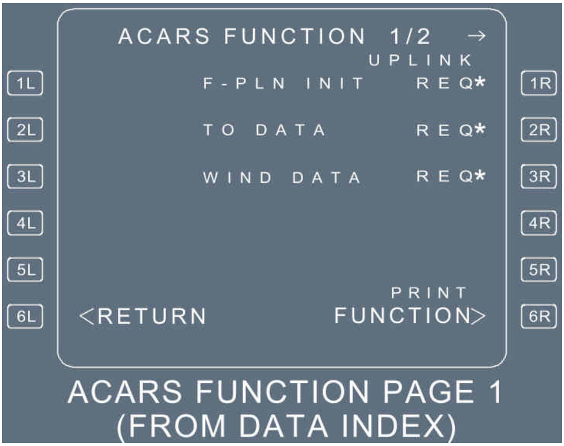
Ident.: DSC-22_45-00000865.0001001 / 18 MAR 11

2 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

This function enables lateral and vertical flight plan data as well as initialization data to be exchanged between the aircraft and a ground station. The aircraft may send flight plan requests for active and secondary flight plan. (downlink messages). The ground station may send flight plan and initialization data (uplink messages) either under aircraft request or automatically without any request.
Each uplink message concerns either the active or secondary flight plan but never both flight plans at the same time. The data sent to the aircraft are checked for flight plan consistency.
A MCDU message comes up when an uplink message is received. “ACT (or SEC) RTE UPLINK”.

If an error prevents the decoding process of the message, “INVALID RTE UPLINK” is displayed on MCDUs.
An uplink message can be routed to the active flight plan if no engine is started and no active flight plan exists. Otherwise, it is routed to the secondary. The crew will insert it into the secondary flight plan or will reject it using the CLR key.

Note: *The flight plan may also be initialized using the ACARS FUNCTION page selected from DATA INDEX page.*



ACARS FUNCTION 1/2 →
UPLINK
F-PLN INIT REQ*
TO DATA REQ*
WIND DATA REQ*
PRINT
<RETURN FUNCTION>

ACARS FUNCTION PAGE 1
(FROM DATA INDEX)

PERFORMANCE DATA

On ground and before engine start, the ground station may also send performance data to the aircraft.
Performance data are always associated with the uplink flight plan. It is either automatically inserted with the active flight plan data, or stored in the secondary with the corresponding flight plan.
This message contains part or all of the following data:
ZFW, ZFWCG, taxi fuel, block fuel, cruise flight level, tropopause altitude, cruise temperature, transition altitude, cost index, performance factor.

Note: *After engine start an uplink performance data message is rejected automatically without any scratchpad message.*

SCRATCHPAD MESSAGES RELATED TO FLIGHT PLAN AND PERFORMANCE

INVALID RTE UPLINK	An error is detected, the uplink message is rejected.
ACT or SEC RTE UPLINK	A F-PLN is stored in the active or secondary flight plan.

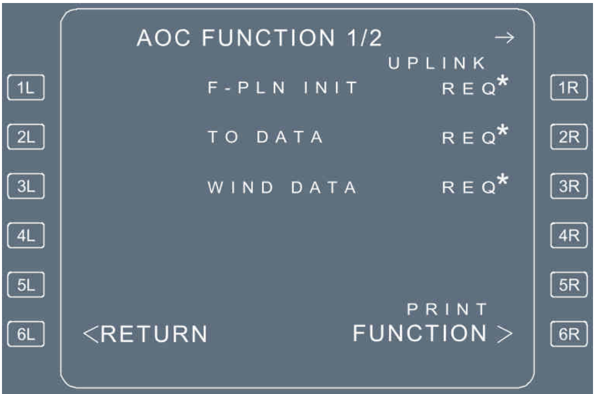
FLT NUMBER UPLINK	FLT NBR has been initialized within a F-PLN message without previous request.
CHECK FLT NUMBER	The uplinked FLT NBR differs from the one specified in the request.
CHECK CO RTE	The uplinked CO RTE ident differs from the one specified in the request.
INVALID FLT NBR UPLINK	The uplink contains a valid F-PLN but the FLT NBR is invalid.
PERF DATA UPLINK	Performance data is received
INVALID PERF UPLINK	Performance uplink message has been rejected
RTE DATALINK IN PROG	A flight plan modification is performed after a F-PLN INIT request has been sent; this message is displayed until the uplink is received.
UPLINK INSERT IN PROG	This message is displayed during insertion of a Flight Plan.

FLIGHT PLAN INITIALIZATION FUNCTION

Ident.: DSC-22_45-00000865.0010001 / 18 MAR 11
Applicable to: MSN 04827-04860

This function enables lateral and vertical flight plan data as well as initialization data to be exchanged between the aircraft and a ground station. The aircraft may send flight plan requests for active and secondary flight plan. (downlink messages). The ground station may send flight plan and initialization data (uplink messages) either under aircraft request or automatically without any request.
Each uplink message concerns either the active or secondary flight plan but never both flight plans at the same time. The data sent to the aircraft are checked for flight plan consistency.
An MCDU message comes up when an uplink message is received. “ACT (or SEC) RTE UPLINK”.
If an error prevents the decoding process of the message, “INVALID RTE UPLINK” is displayed on the MCDUs.
An uplink message can be routed to the active flight plan if no engine is started and no active flight plan exists. Otherwise, it is routed to the secondary flight plan. The flight crew will insert it into the secondary flight plan or will reject it using the CLR key.

Note: *The flight plan may also be initialized using the AOC FUNCTION page selected from DATA INDEX page.*



```
        AOC FUNCTION 1/2           →
                          UPLINK
           F-PLN INIT        REQ*

           TO DATA           REQ*

           WIND DATA         REQ*

                            PRINT
 <RETURN                 FUNCTION >
```

AOC FUNCTION PAGE 1
(FROM DATA INDEX)

INITIALIZATION DATA

On ground and before engine start, the ground station may also send data to initialize the F-PLN. This data is always associated with the uplink flight plan. It is either automatically inserted with the active flight plan data, or stored in the secondary with the corresponding flight plan.
Initialization data is made of part or all of the following elements:
ZFW, ZFWCG, taxi fuel, block fuel, cruise flight level, tropopause altitude, cruise temperature, transition altitude, cost index, performance factor.

Note: *After engine start an uplink initialization data message is rejected automatically without any scratchpad message.*

SCRATCHPAD MESSAGES RELATED TO FLIGHT PLAN AND INITIALIZATION DATA

INVALID RTE UPLINK	An error is detected, the uplink message is rejected.
ACT or SEC RTE UPLINK	A F-PLN is stored in the active or secondary flight plan.
FLT NUMBER UPLINK	FLT NBR has been initialized within a F-PLN message without previous request.
CHECK FLT NUMBER	The uplinked FLT NBR differs from the one specified in the request.
CHECK CO RTE	The uplinked CO RTE ident differs from the one specified in the request.
INVALID FLT NBR UPLINK	The uplink contains a valid F-PLN but the FLT NBR is invalid.
INIT DATA UPLINK	Initialization data is received
INVALID INIT UPLINK	Initialization uplink message has been rejected

RTE DATALINK IN PROG	A flight plan modification is performed after a F-PLN INIT request has been sent; this message is displayed until the uplink is received.
UPLINK INSERT IN PROG	This message is displayed during insertion of a Flight Plan.

TAKEOFF DATA FUNCTION

Ident.: DSC-22_45-00000866.0001001 / 03 NOV 21

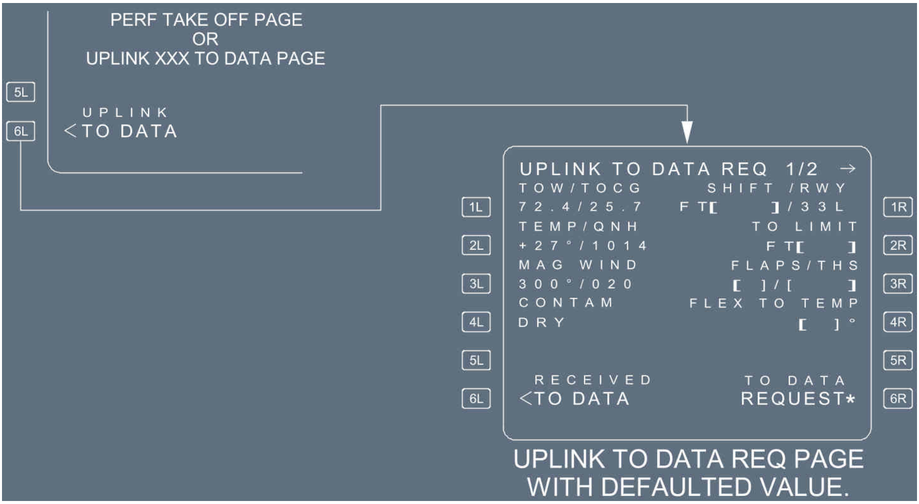
3 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The takeoff data function is available for the active flight plan only. It is used to request to the ground station, information data for up to 2 runways and to receive this data for up to 4 runways.
The flight crew sends a request indicating the departure airport, runway idents, CG, GW and weather conditions (such as BARO setting wind, temperature...). In response the flight crew receives the takeoff speeds for up to 4 runways but only one set of data may be inserted in the active flight plan for the selected active runway.
Takeoff speeds are computed for max and flex takeoff.

The takeoff data function has required the modification of the standard PERF TAKEOFF page and the addition of 2 news pages:

- UPLINK TO DAT REQ page that enables the flight crew to specify a request to the ground.
- UPLINK XXX TO DATA page (XXX for MAX or FLEX)

These 2 pages are accessed from the PERF TAKEOFF page in PREFLIGHT and DONE phase only.



```
UPLINK TO DATA REQ  1/2  →

TAKEOFF DATA UPLINK	:	Takeoff data uplink message is received
INVALID TAKEOFF UPLINK	:	The UPLINK message is rejected

WIND DATA FUNCTION

Ident.: DSC-22_45-00000867.0001001 / 17 MAY 21

4 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

This function enables the crew to request and to receive forecasted winds associated to the active or secondary flight plan.
The uplink message (ground station to aircraft) may be received upon crew request or automatically without crew request.
The request is initiated from WIND pages or from ACARS FUNCTION page (*Refer to DSC-22_20-70 Wind Data - Request for Wind Data*).

The uplink wind data when received are directly displayed on the wind pages but not inserted in the flight plan, one set for each flight phase: CLIMB, CRUISE, DESCENT. The alternate wind at alternate cruise flight level is displayed on DESCENT page.

- Winds are associated to altitude for climb and descent phases
- Winds are associated to waypoint for cruise phase and step level. One wind per waypoint.
  - On ground and without entered winds, an uplink message is directly inserted in the flight plan.
  - In flight, winds are temporary stored until the crew inserts it phase per phase.
    Phase of flight is indicated in the WIND title page.
  - Clearing the INSERT UPLINK* prompt using the CLR key deletes the uplink wind data for the selected phase.

When uplink winds are deleted, the wind page reverts to the previous status.
The flight plan B page is modified of the uplink wind only after it is inserted by the crew. AOC uplink winds are then considered as crew manual entries (large font).

SCRATCHPAD MESSAGES RELATED TO WIND DATA

INVALID WIND UPLINK	An error is detected, the uplink is rejected.
WIND DATA UPLINK	Uplinked winds are received.
WIND UPLINK PENDING	A temporary flight plan exists or a DIR TO page is displayed when a wind uplink is received. The message is stored.
WIND UPLINK EXISTS	A F-PLN modification (active or secondary) is attempted when uplink winds are not inserted. This message disappears automatically when the wind uplink is inserted or deleted.

CHECK DEST DATA	The aircraft is at 180 NM from destination, and the destination QNH, TEMP or WIND displayed on the PERF APPR page was received by AOC uplink or, if following insertion of a descent wind uplink, a conflict concerning the above parameters exists.
CHECK ALTN WIND	The uplinked alternate cruise flight level differs from the default alternate cruise flight level.

FLIGHT REPORTS

Ident.: DSC-22_45-00000868.0001001 / 10 MAY 22

5 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Flight reports provide real time information to the ground concerning the aircraft current situation and position.

Several types of flight reports are available:
- The Position report : provides current aircraft position
- the Progress report : provides data relative to the destination
- The Flight-Plan report : provides the active route
- the Performance Data report : provides performance data currently used by FMS.

These reports may be manually initiated via a dedicated prompt or automatically sent in response to a ground request or upon specific conditions.

POSITION REPORT

This report is sent:
- manually via a MCDU prompt or
- following a ground request or
- automatically upon sequencing a designated reporting fix (designated by the ground in a uplink message).

The manual POSITION REPORT downlink prompt is displayed on the PROG page. (SEND POS prompt).

```

Note: Position report are initiated from active flight plan only.

POSITION REPORT CONTENT

- Aircraft position
- Overfly reporting waypoint
- Time of report (UTC)
- Aircraft altitude
- Next reporting waypoint
- ETA at next reporting waypoint
- Reporting waypoint following next report
- SAT
- Current wind
- Remaining fuel

PROGRESS REPORT

A progress report contains data relative to the aircraft arrival time and EFOB at destination for the active F-PLN.

This downlink message is automatically sent following:

- a ground request or
- a change of destination or
- a change of runway or
- a specific event. The possible events that can be selected in the navigation database policy file are :
  - X minutes to Top of Descent
  - Z minutes to Destination
  - ETA changes more than W minutes from the previous report.
    X, Z and W are minutes of time set in the navigation database policy file.

The progress report cannot be manually sent by the crew via a dedicated MCDU prompt.

PROGRESS REPORT CONTENT

- Flight Number
- Arrival Airport Ident
- Destination Runway Ident
- Predicted remaining fuel
- ETA at destination
- Reason for report (specific event, ground request...).

FLIGHT PLAN REPORT

The F-PLN report broadcasts flight plan data to the ground. Only data from the active flight plan can be sent.

This downlink message is sent to the ground:

- automatically following a ground request
- manually by the crew using a prompt displayed on the ACARS FUNCTION page (DSC-22_20 Auto Flight - Flight Management/50 Controls and Indicators/10 MCDU - Page Description/25 FMS2 Honeywell/ACARS Function Page). This prompt may be invalidated through the navigation database policy file.

The Flight Plan report can be downlinked either while on ground or in flight during any flight phase.

FLIGHT PLAN REPORT CONTENT

The report contains the active and alternate flight plan.

PERFORMANCE DATA REPORT

The Performance Data report is a downlink message that allows the transmission of performance data (CG, FUEL, and etc.) relative to the active F-PLN.
This message is automatically sent following a ground request. Manual sending is not possible.

PERFORMANCE DATA REPORT CONTENT

Sends to the ground:

- Current GW
- Cruise Altitude
- Current CG
- Fuel on Board
- Block Fuel
- Reserve Fuel
- Cost Index
- Top of Climb Temperature
- Climb Transition Altitude
- Tropopause Altitude
- Taxi Fuel
- ZFW
- ZFWCG

PRINT FUNCTION

Ident.: DSC-22_46-00000869.0003001 / 01 APR 11

1 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04773, 04953-05987, 06097, 06121, 06139-09324, 10949-11597**

The print function enables several types of data and report to be printed :
- Flight plan initialization data
- Takeoff data
- Wind data
- Preflight report
- In flight report
- Post flight report

The 3 first reports may differ when automatically or manually printed for the following reason :
The automatic process prints the uplink message although the manual process prints the current active data as displayed on the relevant MCDU pages.
The last 3 reports being processed from the same sources are identical in automatic or manual printing.

Note: *ACARS is not necessary linked to printing process. The printing function may be activated within the FMGS and selected independently from the ACARS.*

- One or several print functions may be deactivated *Refer to DSC-22_20-50-10-25 Print Function Pages*.
- If an ACARS function is not active, (not selected in the nav database policy file) the printing process is invalidated for this specific ACARS function.

PRINT FUNCTION

Ident.: DSC-22_46-00000869.0004001 / 01 APR 11

Applicable to: MSN 04827-04860

The print function enables several types of data and report to be printed :
- Flight plan initialization data
- Takeoff data
- Wind data
- Preflight report
- In flight report
- Post flight report

The 3 first reports may differ when automatically or manually printed for the following reason :
The automatic process prints the uplink message although the manual process prints the current active data as displayed on the relevant MCDU pages.

The last 3 reports being processed from the same sources are identical in automatic or manual printing.

Note: *ACARS is not necessary linked to printing process. The printing function may be activated within the FMGS and selected independently from the ACARS.*

- One or several print functions may be deactivated *Refer to DSC-22_20-50-10-28 PRINT FUNCTION Pages*.
- If an ACARS function is not active, (not selected in the nav database policy file) the printing process is invalidated for this specific ACARS function.

AOC/PRINTER PROGRAMMING OPTIONS ⊲

Ident.: DSC-22_46-00000870.0002001 / 11 FEB 11

2 **Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

Option programming for the AOC/PRINTER functions is obtained through the Navigation Data Base policy file or the Airline Modifiable Information (AMI) file.

The list summarizes the possible options:

Data Link (ACARS or AOC) Inhibit	Disables AOC function
F-PLN Data Request Inhibit	Disables uplink and downlink requests of F-PLN initialization data
Performance Data Request Inhibit	Disables uplink and downlink requests of Performance Initialization data
Takeoff Data Request Inhibit	Disables uplink and downlink request of Takeoff Initialization data
Wind Data Request Inhibit	Disables uplink and downlink request of predicted wind data
Flight Number Enable	Flight Number is included within the F-PLN Request or Progress Report downlinks
Position Report Inhibit	Disables a manual Position Report downlink
Progress Report Triggers	Defines the triggers for the automatic downlink of the Progress Report
F-PLN Report Inhibit	Disables the manual downlink of the F-PLN Report

Auto Print of ACARS or AOC uplinks	Selects/Deselects the automatic printing of the F-PLN, INIT, TO and wind data uplinks. If Autoprint is selected, the crew can deselect it manually. If auto printing is deselected, the crew cannot manually reselect it.
Auto Print of Flight Reports	Selects/Deselects the automatic printing of the Preflight, Inflight, Postflight reports. If selected, the crew can deselect it manually. If autoprint is deselected, the crew cannot manually preselected it.

INTRODUCTION

Ident.: DSC-23-10-10-00022672.0001001 / 25 MAY 20
Applicable to: ALL

The communication system enables:

- Internal communication between the:
  - Flight crew and additional cockpit occupant(s)
  - Cabin crew
  - Ground crew
  - Passengers (i.e. for flight or cabin crew announcements).

  Internal communication is possible via the flight, cabin, and service interphones, and via the Passenger Address (PA).
- External communication via radio communication (HF ◁ or VHF) or Satellite Communication (SATCOM ◁), either in voice mode or data mode.

COMMUNICATION SYSTEM ARCHITECTURE

1 Ident.: DSC-23-10-10-00018503.0002001 / 18 MAY 21
Applicable to: MSN 11482-11597

The communication system comprises the following subsystems:

Audio and avionic link
Backup audio link for RMP1,2 and 3

RMPs and ACPs are directly interfaced with:

- Cockpit and ground crew audio peripherals
- AMU (for control setting and audio management)
- The other RMPs (for audio signal backup).

Note: *1. ACPs are not interfaced with other ACPs or RMPs.*
2. RMP 3 ◁ is not backed-up for RMP1 nor RMP2.

Ground crew call audio function is directly interfaced with AMU through ACP 3 or RMP3 ◁ . In case of loss of ACP 3 or RMP3 ◁ , the ground crew call audio function is lost.
AMU is directly interfaced with different aircraft systems to provide audio functions and radio navigation backup functions.
In the case of AMU total failure, audio functions are lost and RMP 1 automatically activates the RMP 1 XPDR1/ TCAS backup control mode and:

- Flight crew controls XPDR 1 through RMP 1
- XPDR 2 control function is lost
- XPDR/TCAS control function is lost in RMP 2 and RMP3 ◁ .

DESCRIPTION

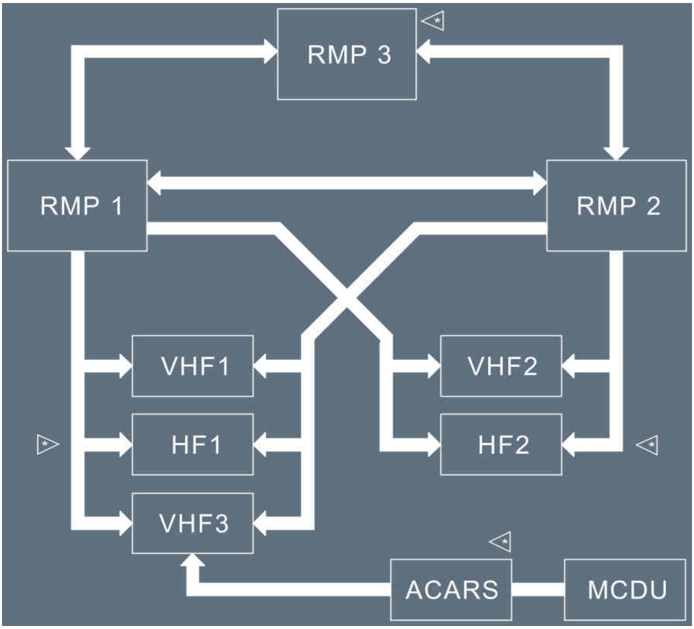
Ident.: DSC-23-10-20-00018494.0001001 / 17 MAY 21

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

Identical Radio Management Panels (RMPs):

- Give the flight crew control of all VHF radio communication systems (HF systems ◁).
- Provide backup to the FMGCs for controlling radio navigation systems (*Refer to DSC-34-NAV-30-10 General*).

The two RMPs are on the center pedestal (and the third ◁ is on the overhead panel).
Each RMP can control any VHF (HF ◁) transceiver. RMP1 and RMP2 are connected directly to all VHF (HF ◁) transceivers, (whereas RMP3 ◁ is connected to them via RMP1 and RMP2). RMPs are connected together so that each RMP is updated to the selections made on the other RMPs.
Only RMP1 functions in EMER ELEC CONFIG.



If one RMP fails, the remaining one controls all the VHF (HF ◁) transceivers except if RMP3 is not installed and ACARS is connected to VHF3. In such case, the VHF3 can only be tuned in data by the ACARS.

RADIO MANAGEMENT PANEL

Ident.: DSC-23-10-20-00018495.0001001 / 22 MAR 17

Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-04544, 04570-04773, 04953-04974, 05066, 05101-05345, 05591-05752

(1) Frequency displays
The ACTIVE display window shows the active frequency of the selected radio, which is identified by a green light on the selection key.
The STBY/CRS (standby/course) display window shows a standby frequency that the pilot can activate by pressing the transfer key or change by rotating the tuning knobs. (For a description of the CRS function *Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP)*).

(2) Transfer key
Pressing this key moves the active frequency to the standby window and the standby frequency to the active window.
This tunes the selected receiver to the new active frequency.

(3) Radio com selection keys

When the pilot presses one of these keys:
- The ACTIVE window displays the frequency set on that radio.
- The STBY/CRS window displays the selected standby frequency or course.
- The selected key displays a green monitor light.

(4) Frequency selector knobs
The pilot uses these concentric knobs to select the STBY frequency or CRS.
The outer knob controls whole numbers; the inner knob controls decimal fractions.

(5) AM pushbutton
If the aircraft has HF radios and the flight crew has selected an HF tranceiver, this switch selects the AM mode. (The default mode is the SSB, or single side-band mode).
This key displays a green monitor light when the AM mode is active.

(6) SEL indicator

The SEL indicator on both RMPs comes on amber when a transceiver, normally associated with one RMP, is tuned by another:

- If 2 RMP installed:
  - VHF1 (VHF3, ◁ , HF1 ◁), tuned by RMP2,
  - VHF2 (HF2 ◁), tuned by RMP1.
- If 3 RMP installed:
  - VHF1 tuned by RMP2 or RMP3,
  - VHF2 tuned by RMP1 or RMP3,
  - VHF3, HF1, (HF2 ◁) tuned by RMP1 or RMP2.

(7) NAV pushbutton (with transparent switchguard)
The pilot presses this key to select navigation receivers and courses through the RMP.
It does not affect the selection of communication radios and their frequencies. (*Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP)*, for additional information).

(8) Radio navigation selection keys
The pilot presses one of these keys to select a navigation radio to control through this RMP.
This turns on the key's green monitor light.
Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP), for additional information.

(9) ON/OFF switch
This switch controls the RMP power supply.

Note: *RMP3 is able to control VHF and HF transceivers through RMP1 and RMP2 even when either of the latter is OFF.*

The STBY/CRS (standby/course) display window shows a standby frequency that the pilot can activate by pressing the transfer key or change by rotating the tuning knobs. (For a description of the CRS function *Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP)*).

(2) Transfer key
Pressing this key moves the active frequency to the standby window and the standby frequency to the active window.
This tunes the selected receiver to the new active frequency.

(3) Radio com selection keys

When the pilot presses one of these keys:
- The ACTIVE window displays the frequency set on that radio.
- The STBY/CRS window displays the selected standby frequency or course.
- The selected key displays a green monitor light.

(4) Frequency selector knobs
The pilot uses these concentric knobs to select the STBY frequency or CRS.
The outer knob controls whole numbers; the inner knob controls decimal fractions.

(5) AM pb-sw
If the aircraft has HF radios and the flight crew has selected an HF tranceiver, this switch selects the AM mode. (The default mode is the SSB, or single side-band, mode).
This key displays a green monitor light when the AM mode is active.

(6) SEL indicator

The SEL indicator on both RMPs comes on amber when a transceiver normally associated with one RMP is tuned by another:
- VHF 1 tuned by RMP 2 or RMP 3,
- VHF 2 tuned by RMP 1 or RMP 3.
- VHF 3, HF 1, HF 2 (◁✳) tuned by RMP 1 or RMP 2.

(7) NAV pb sw (with transparent switchguard)
The pilot presses this key to be able to select navigation receivers and courses through the RMP. It does not affect the selection of communication radios and their frequencies. (*Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP)*, for additional information).

(8) Radio navigation selection keys
The pilot presses one of these keys to select a navigation radio to control through this RMP. This turns on the green monitor light in the key.
Refer to DSC-34-NAV-30-30 Radio Management Panel (RMP), for additional information.

(9) ON/OFF sw
This switch controls the power supply to the RMP.

Note: *RMP 3 is able to control VHF and HF transceivers through RMP 1 and RMP 2 even when they are OFF.*

(10) LOAD FUNCTION ◁✳
When the ATC sends (CONTACT or MONITOR) CPDLC messages to the flight crew, a white light above the LOAD key comes on to indicate that the sent frequency is available to be loaded.
Press on this LOAD key before closing the CONTACT/MONITOR messages to load this VHF frequency to the STBY/CRS window.

Note: *When a frequency from the ATC services (sent label via datalink) has been received, the ATSU validates the frequency and simultaneously sends the information to all the RMP in order to activate the LOAD function.*
When the LOAD function is activated, the flight crew can repeatedly load the frequency on each RMP as often as necessary; except if DATA is present on standby window.

RMP ARCHITECTURE

Applicable to: MSN 11482-11597

3 Ident.: DSC-23-10-20-A-00024135.0001001 / 25 MAY 20

Identical Radio Management Panels (RMPs):
- Give the flight crew control of all VHF radio communication systems (HF ◁✱ systems).
- Provide backup to the FMGCs for controlling radio navigation systems (*Refer to DSC-34-NAV-30-10 General*).

The two RMPs are on the center pedestal (and the third ◁✱ is on the overhead panel).

4 Ident.: DSC-23-10-20-A-00022684.0001001 / 25 MAY 20

RADIO MANAGEMENT PANEL (RMP)

There are two Radio Management Panels (RMPs) (third RMP ◁✱) in the cockpit. The flight crew uses these RMPs to control the communication system.

On each RMP, the flight crew can:
- Manage the radio communication means:
  - Select the communication means in transmission and/or reception mode(s)
  - Control the volume of the communication means
  - Tune HF ◁✱ and VHF frequencies
  - Dial SATCOM ◁✱ Telephone (TEL) numbers
  - Load frequencies and phone numbers from the DCDU
  - Select voice or data mode.
- Manage the Flight Interphone, the Passenger Address, the Cabin Interphone and the Ground Crew communication means

- Manage the radio navigation systems:
  - Adjust the volume for voice communication and for NAVAID identification.
  - Select Standby Radio Navigation (STBY RAD NAV) and tune the NAVAIDs (only via RMP 1 and RMP 2).
    For information on standby radio navigation tuning, *Refer to DSC-34-NAV-30-30 NAV Page*.
- Manage the transponders:
  - Select the transponder settings
  - Enter the Squawk (SQWK) code and squawk IDENT
  - Select the TCAS settings

In addition to the RMPs, the flight crew uses:
- The CALLS panel to generate visual, and aural call indications (in the cabin and/or on the steering nose gear panel) via the flight and cabin interphones
- The Evacuation (EVAC) panel ◁ , to initiate evacuation of the aircraft
- The Emergency Locator Transmitter (ELT) panel, to control the ELT.

5 Ident.: DSC-23-10-20-A-00022674.0001001 / 25 MAY 20

RMP SYNCHRONIZATION

The RMPs share selections and inputs in order to enable the flight crew to control all radio communication via any RMP.

L2 The RMPs share mainly the following data:
- Active and standby frequencies
- SATCOM ◁ channels and their status (e.g. logged on/off, cabin calls enabled/disabled, connected)
- Active function displays (e.g. Amplitude Modulation (AM)).

L1 However, it is possible to display a different page on each RMP.

6 Ident.: DSC-23-10-20-A-00022675.0001001 / 18 MAY 21

ACTIVE COMMUNICATION

In normal operation:
- The Captain controls communication via RMP 1
- The First Officer controls communication via RMP 2
- The third occupant controls communication via ACP 3 or RMP 3 ◁ .
- The fourth occupant controls communications via ACP 4 ◁ .

7 Ident.: DSC-23-10-20-A-00022676.0001001 / 25 MAY 20

STANDBY CONTROL

If a connection or an RMP fails, the communication system can automatically reconfigure to ensure continued communication control.
Standby connections are activated instead of the failed connections.
RMP 3 can be used, as a backup, instead of the failed RMP (except for STBY RAD NAV control).
If the FMS can no longer control the radio NAVAIDS (e.g. FMS failure), RMPs 1 and 2 can also be used, as a backup, to tune the NAVAIDS.

AUDIO MANAGEMENT SYSTEM

Ident.: DSC-23-10-30-00018496.0002001 / 17 MAR 17
Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876

The audio management system allows the flight crew to use :
- All the radio communication and radio navigation facilities installed on the aircraft in transmission and reception mode.
- The interphone systems.
- The call systems.
- The passenger address system.

The audio management system includes :
- An audio management unit (AMU).
- Three audio control panels (ACPs) (fourth and fifth optional).
- Sockets at each station:
  - Headset jack and boomset connector (hand microphone connector ◁) for pilot, copilot, and third occupant.
  - Headset jack for fourth occupant.
- One interphone jack at the ground power receptacle.
- Boomsets for the pilot, copilot, and third occupant, and three hand microphones (fourth ◁).
- Three cockpit oxygen mask microphones.
- One radio press-to-talk switch on each sidestick.
- One SELCAL code selection panel (avionics compartment).
- Two cockpit loudspeakers with separate volume controls.
- If installed, a jack panel in the electronic compartment that groups the headset jack, service interphone jack, hand mike connector, and boomset.
- An audio switching facility.

If audio channel 1 or 2 fails due to a failure either in an ACP or the corresponding AMU, the crew can use the AUDIO SWITCHING selector to select the third audio channel.

AUDIO MANAGEMENT SYSTEM

Ident.: DSC-23-10-30-00018496.0001001 / 17 MAR 17

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11293**

The audio management system allows the flight crew to use :
- All the radio communication and radio navigation facilities installed on the aircraft in transmission and reception mode.
- The interphone systems
- The call systems
- The passenger address system

The audio management system includes :

- An audio management unit (AMU)
- Three audio control panels (ACPs) (fourth and fifth optional)
- Sockets at each station
  - Headset jack and boomset connector (hand microphone connector ◁✻) for pilot, copilot, and third occupant
  - Headset jack for fourth occupant
- One interphone jack at the ground power receptacle
- Boomsets for the pilot, copilot, and third occupant, and three hand microphones (fourth ◁✻)
- Three cockpit oxygen mask microphones
- One radio press-to-talk switch on each sidestick
- One SELCAL code selection panel (avionics compartment)
- Two cockpit loudspeakers with separate volume controls
- If installed, a jack panel in the electronic compartment that groups the headset jack, service interphone jack, hand mike connector, and boomset
- An audio switching facility

If audio channel 1 or 2 fails due to a failure either in an ACP or the corresponding AMU, the crew can use the AUDIO SWITCHING selector to select the third audio channel.

AUDIO MANAGEMENT SYSTEM

2 Ident.: DSC-23-10-30-00018496.0003001 / 09 NOV 21

Applicable to: MSN 11482-11597

The Audio Management Unit (AMU) is located in the avionic bay.

The AMU manages:
- Communication transmission / reception of all the radio communication and radio navigation facilities
- Internal communication.

The AMU manages and adjusts the volume of audio signals (analog) between the communication equipment and the:

- VHF / HF ◁ transceivers
- SATCOM ◁ system
- SELCAL
- NAVAID receivers (for NAVAID identification in STBY RAD NAV)
- Flight interphone
- Cabin Intercommunication Data System (CIDS) that includes:
  - The cabin interphone
  - The service interphone
  - The Passenger Address (PA).

Note: *The cockpit handset is directly connected to the CIDS.*

The AMU is the interface for the voice.

CABIN INTERCOMMUNICATION DATA SYSTEM

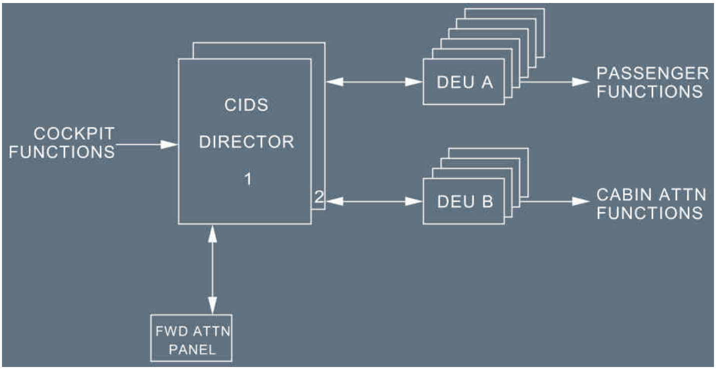
Ident.: DSC-23-10-30-00018497.0001001 / 03 OCT 17
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

The Cabin Intercommunication Data System (CIDS) transmits, controls, and processes signals for the following cabin systems:

- Cabin and service interphone
- Passenger address
- Passenger lighted signs
- Reading light
- General cabin illumination
- Emergency evacuation signalling

- Lavatory smoke indication
- Passenger entertainment system ◁
- Escape slide bottle pressure monitoring ◁ .

The CIDS has the following main components:
- Two CIDS directors connected in parallel, one active, and the other on standby
- Forward attendant panel for control of the cabin systems
- Programming and test module that allows the system to be reprogrammed after changes are made in the cabin configuration.



Decoder/Encoder Units (DEUs) linked to the two directors:
- Type A units (for passengers) installed along each side of the passenger cabin.
  The loudspeakers, lighted signs, call buttons, call lights and general illumination ballast units are divided into small groups, each connected to a type A DEU
- Type B units (for attendants) installed near the exit doors. The Area Call panels, attendant handsets, slide and door pressure sensors, and attendant indicator panels, are connected to type B DEUs.

CABIN INTERCOMMUNICATION DATA SYSTEM

Ident.: DSC-23-10-30-00018497.0002001 / 10 MAY 22

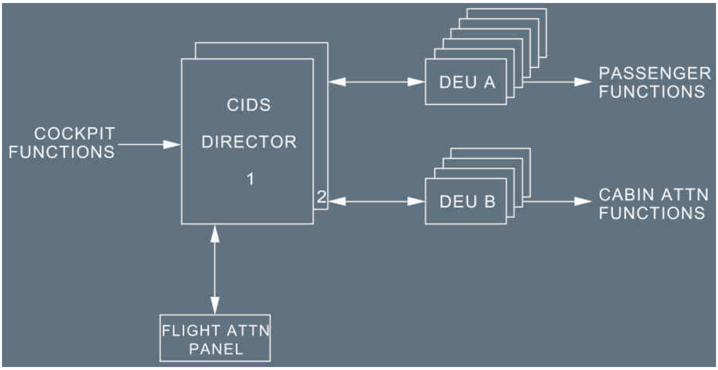
3 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

The Cabin Intercommunication Data System (CIDS) transmits, controls, and processes signals for the following cabin systems :
- Cabin and service interphone
- Passenger address
- Passenger lighted signs
- Reading lights (LED technology)
- General cabin illumination

- Emergency evacuation signalling
- Lavatory smoke detectors and indicators
- Passenger entertainment system
- Escape slide bottle pressure monitoring
- Vacuum system control function
- Cargo and lavatory smoke detection function.

The CIDS has the following main components :

- Two CIDS directors connected in parallel ; one active, and the other on standby
- Flight Attendant Panel (FAP) to monitor and control the cabin systems
- Attendant Indication Panels (AIP), After Attendant Panels (AAP) and Area Call Panels (ACP)
- Decoder/Encoder Units (DEUs) linked to the two directors:
    - Type A units (for passengers) installed along the cabin.
      The loudspeakers, lighted signs, call buttons, call lights and general illumination ballast units are divided into small groups, each connected to a type A DEU
    - Type B units (for attendants) installed near the exit doors. The Area Call panels, smoke detectors, attendant handsets, slide and door pressure sensors, and attendant indicator panels, are connected to type B DEUs.



DESCRIPTION

1 Ident.: DSC-23-10-40-00018569.0011001 / 13 DEC 22
Applicable to: MSN 11482-11597

The CVR records:
- Direct conversations between crew members in the cockpit
- All aural warnings sounded in the cockpit
- Audio communications received and transmitted
- Intercommunications conversations between crew members
- Announcements transmitted over the PA system.

Only the last 25 h of recording are retained.

The CVR system consists of:
- A cockpit area microphone
- A “hot mike” function, which records the crew members voice directly from their microphone, even if the push to talk switch is not activated
- A crashproof four-track recorder, equipped with an underwater locating beacon, in the aft section of the aircraft
- A control panel on the overhead panel.

The CVR is recording automatically:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight
- On ground until 5 min after the last engine shutdown.

On ground, when GND CTL pb-sw is pressed, the CVR is recording.

DESCRIPTION

Ident.: DSC-23-10-40-00018569.0007001 / 10 MAY 21
2 **Applicable to: MSN 10949-11293**

The CVR records:
- Direct conversations between crew members in the cockpit
- All aural warnings sounded in the cockpit
- Audio communications received and transmitted
- Intercommunications conversations between crew members
- Announcements transmitted over the PA system, if PA reception is selected on at least one audio control panel.

Only the last 25 h of recording are retained.

The CVR system consists of:
- A cockpit area microphone
- A “hot mike” function, which records the crew members voice directly from their microphone, even if the push to talk switch is not activated
- A crashproof memory unit, equipped with an underwater locating beacon
- A control panel on the overhead panel.

The CVR is recording automatically:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight.
- On ground until 5 min after the last engine shutdown.

On ground, when GND CTL pb-sw is pressed, the CVR is recording.

DESCRIPTION

Ident.: DSC-23-10-40-00018569.0001001 / 10 MAY 21
Applicable to: MSN 01459

The CVR records:
- Direct conversations between crew members in the cockpit
- All aural warnings sounded in the cockpit
- Audio communications received and transmitted
- Intercommunications conversations between crew members
- Announcements transmitted over the PA system, if PA reception is selected on at least one audio control panel.

Only the last 2 h of recording are retained.

The CVR system consists of:
- A remote microphone behind the overhead panel
- A crashproof four-track recorder, equipped with an underwater locating beacon, in the aft section of the aircraft
- A control panel on the overhead panel.

The CVR is recording automatically:
- On ground during the first 5 min after the aircraft electrical network is energized
- On ground with one engine running
- In flight
- On ground until 5 min after the last engine shutdown provided the CVR jack is not used.

On ground, when GND CTL pb-sw is pressed, the CVR is recording.

DESCRIPTION

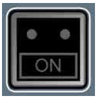
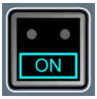
(spring-loaded)
CVR ERASE pb
CVR TEST pb

GND CTL pb-sw



The CVR, DFDR and QAR ◁ automatically operate (AUTO), according to the logic (*Refer to DSC-23-10-40 Description*).



The flight crew manually starts the CVR, DFDR, and QAR ◁ .
After engine start, the ON light goes off and the recorders automatically operate.

Note: *The GND CTL pb-sw may revert to AUTO (active or inactive, according to the logic) during an electrical transient.*

CVR ERASE pb

When pressed for 2 s, the CVR ERASE function ◁ erases the CVR full recording, if:
- The aircraft is on the ground, and
- The parking brake is on.

CVR TEST pb

When pressed and held:
This activates the test, if the CVR is on (the GND CTL pb-sw pressed, or during the first 5 min after energization of the aircraft electrical network), and the parking brake is on.

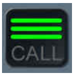
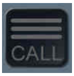
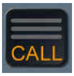
EXTERNAL TRANSMISSION KEYS



The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated channel.

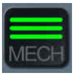


The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated channel.



Flashes to indicate an incoming SELCAL.
When a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via SELCAL/Call RESET Key.

INTERNAL TRANSMISSION KEYS (INT/CAB)



The INT interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.

The INT interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.

Flashes to indicate an incoming call from the ground crew.
The MECH light goes off after 60 s, if it is not reset.

The CAB interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.

The CAB interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.

Flashes to indicate an incoming call from the cabin crew.
The ATT light goes off after 60 s, if it is not reset.

PASSENGER ADDRESS (PA) FUNCTION

Refer to DSC-23-20-40 Description.

RECEPTION KNOBS

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is in reception mode.

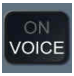
Note: *For the reception of DME audio navigation signals associated with an ILS station, the LS pb on the FCU must also be selected.*
The INTEG LT knob or the ANN LT knob controls the brightness of the reception knob.

SELCAL/CALL RESET KEY

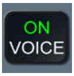
When pressed, the buzzer sound is cancelled.

VOICE FILTER KEY

VOICE filter key allows the flight crew to inhibit the most commonly used audio navigation signals (VOR, ADF).



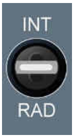
Audio filter is not active. When pressed, the VOICE filter key turns on the IDENT signals filter.



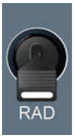
Audio filter is active. When pressed, the VOICE filter key turns off the IDENT signals filter.

INT/RAD SWITCH

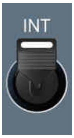
The flight crew uses the interphone/radio Push-To-Talk switch (INT/RAD sw) to activate the boomset, or oxygen mask microphones.



The INT/RAD sw is in the off position.



When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate key should be selected first, in order to transmit the message.
When released, the INT/RAD sw returns to the off position.



When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone.
When released, the INT/RAD sw remains in the INT position, until the flight crew selects another switch position.

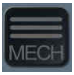
EXTERNAL TRANSMISSION KEYS

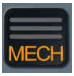
	The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated channel.
	The associated communication means (i.e. VHF 1(2)(3), HF 1(2)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated channel.
	Flashes to indicate an incoming SELCAL. When a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via SELCAL/Call RESET Key.

INTERNAL TRANSMISSION KEYS (INT/CAB)

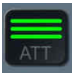
	The INT interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.



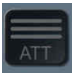
The INT interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.



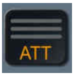
Flashes to indicate an incoming call from the ground crew.
The MECH light goes off after 60 s, if it is not reset.



The CAB interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated interphone.

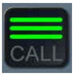


The CAB interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated interphone.

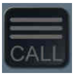


Flashes to indicate an incoming call from the cabin crew.
The ATT light goes off after 60 s, if it is not reset.

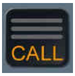
SATCOM TRANSMISSION KEYS



Steady green light indicates when the associated SATCOM channel is in transmission mode. When pressed, the transmission key turns off the transmission mode of the associated SATCOM channel.
Flashing green light indicates the establishment of air to ground call of the associated SATCOM channel or the associated SATCOM call is on hold.



The associated SATCOM channel is not in transmission mode. When pressed, the transmission key turns on the transmission mode of the associated SATCOM channel.



Flashes to indicate an incoming call from ground via SATCOM channel.

SELCAL/CALL RESET KEY

When pressed, the buzzer sound is cancelled.

PASSENGER ADDRESS (PA) FUNCTION

Refer to DSC-23-20-40 Description.

SATCOM RECEPTION KNOBS

The associated SATCOM channel is not in reception mode. When pressed and released in the out position, the reception knob turns on the reception mode.

The associated SATCOM channel is in reception mode. When pressed and released in the in position, the reception knob turns off the reception mode. When turned, the reception knob adjusts the volume of the headset.

Note: The INTEG LT knob or ANN LT knob controls the brightness of the reception knob.

INT/RAD SWITCH

The flight crew uses the interphone/radio Push-To-Talk switch (INT/RAD sw) to activate the boomset, or oxygen mask microphones.

The INT/RAD sw is in the off position.

When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate key should be selected first, in order to transmit the message.
When released, the INT/RAD sw returns to the off position.

When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone.
When released, the INT/RAD sw remains in the INT position, until the flight crew selects another switch position.

VOICE FILTER KEY

VOICE filter key allows the flight crew to inhibit the most commonly used audio navigation signals (VOR, ADF).

Audio filter is not active. When pressed, the VOICE filter key turns on the IDENT signals filter.

Audio filter is active. When pressed, the VOICE filter key turns off the IDENT signals filter.

RECEPTION KNOBS

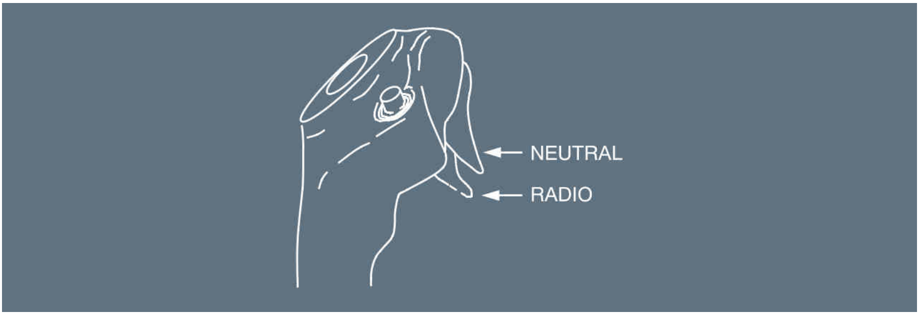
The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2), INT, or CAB) is in reception mode.

Note: *For the reception of DME audio navigation signals associated with an ILS station, the LS pb on the FCU must also be selected.*
The INTEG LT knob or ANN LT knob controls the brightness of the reception knob.

SIDE STICK RADIO SELECTOR

Ident.: DSC-23-10-50-00018499.0001001 / 17 MAR 17
Applicable to: ALL



This selector has the same function as the INT/RAD switch on the ACP.

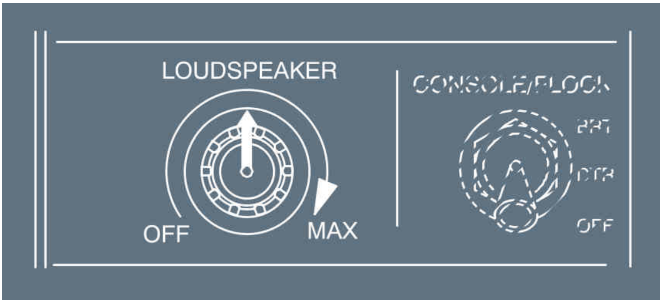
NEUTRAL (spring-loaded) : Boom and mask mikes are dead.
Reception is normal.

RADIO (squeezed) : Boom and mask mikes transmit through the equipment selected by the transmission key on the ACP.

Note: *If RADIO is selected on the side stick when the INT/RAD switch is on INT, the radio function has priority over the interphone function.*

LOUDSPEAKER VOLUME KNOB

Ident.: DSC-23-10-50-00018500.0001001 / 17 MAR 17
Applicable to: ALL



This knob adjusts the volume of the loudspeaker for radio communication.

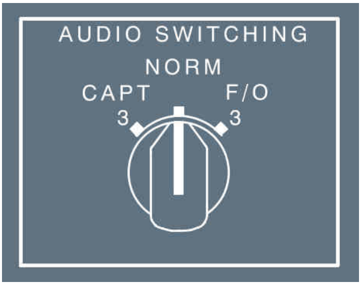
OFF	:	Loudspeaker does not respond to signals from the aircraft's radio equipment.
Clockwise rotation	:	Loudspeaker broadcasts signals from the aircraft's radio equipment at increasing volume.

Note: *This knob does not control the loudness of aural alert and voice messages.*
In the case of acoustic feedback (i.e. Larsen effect) from the cockpit loudspeaker, the flight crew should reduce the volume of the cockpit loudspeaker. However, the flight crew should ensure that the volume of the cockpit loudspeaker is sufficient to hear radio communication.

AUDIO SWITCHING

Ident.: DSC-23-10-50-00018501.0001001 / 17 MAR 17

2 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**



The crew can switch to the third ACP if ACP1 or ACP2 fails.
When the crew does this, it takes away the third occupant's access to the acoustic equipment.
AUDIO 3 XFRD appears in green on the ECAM MEMO display.

NORM :	Each crew member uses his dedicated communication equipment.
CAPT 3:	The pilot uses his acoustic equipment and the third occupant's ACP.
F/O 3 :	The copilot uses his acoustic equipment and the third occupant's ACP.

Intentionally left blank

FLIGHT INTERPHONE

Ident.: DSC-23-20-10-00019716.0001001 / 18 MAY 21
Applicable to: ALL

AMUs hosts the flight interphone.

Flight crewmembers use the flight interphone to communicate with each other and with the ground crew via:
- Boomsets/headsets
- Hand microphones
- Microphones on the oxygen masks.

Ground crew can communicate with flight crew via the FLT INT jack on the maintenance nose landing gear panel (FWD of the nose L/G bay).

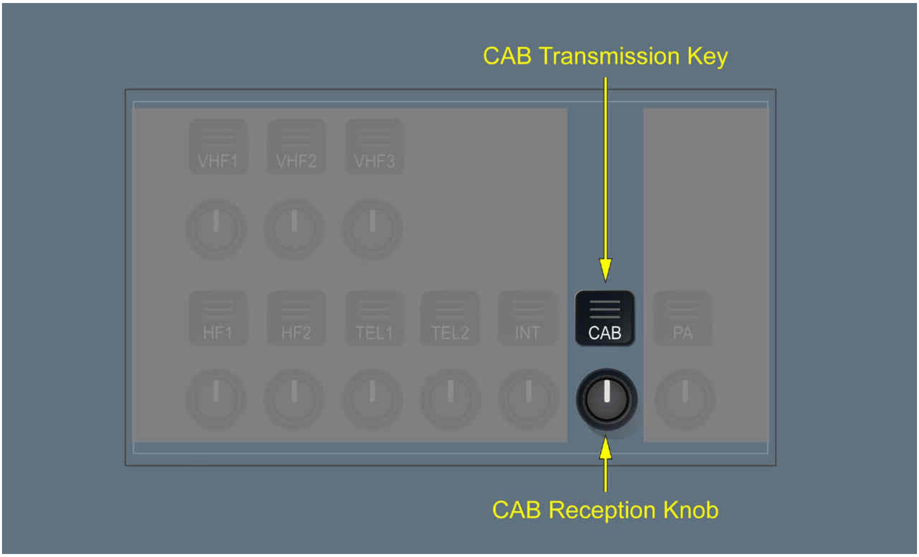
AMU
Any Crew Rest Compartment

Before transmitting via any other appropriate equipment, on the RMP the flight crew should:

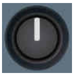
- Press and release the CAB reception knob in the out position
- Press the CAB transmission key
- Press a PTT sw or set the INT/RAD sw to RAD to transmit.



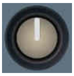
CAB TRANSMISSION KEY

	The CAB interphone is in transmission mode. When pressed, the transmission key turns off the transmission mode.
	The CAB interphone is not in transmission mode. When pressed, the transmission key turns on the transmission mode.
	Indicates that the CAB interphone is not installed.
	Flashes to indicate an incoming call from the cabin crew. When a cabin crew call is received, a buzzer sounds in the cockpit and the CAB light flashes for 60 s, or until the flight crew answers the call.

CAB RECEPTION KNOB



The CAB interphone is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.



The CAB interphone is in reception mode.
When turned, the reception knob adjusts the volume of the headsets and the loudspeakers.
When pressed and released in the in position, the reception knob turns off the reception mode.

CABIN CALL SYSTEM

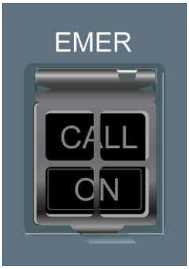
When pressed:
- Two steady pink lights come on, on the corresponding area call panel
- “CAPTAIN CALL” message appears on the corresponding AIP, and a green light comes on
- A high-low chime sounds through corresponding loudspeaker.

ALL pb ⊲

When pressed: all stations respond as indicated above.

EMER pb-sw (GUARDED)

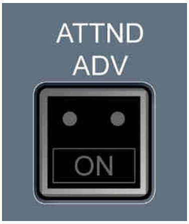


When pressed:
- Two pink lights flash on all area call panels
- “EMERGENCY CALL” message appears on all AIPs
- A high-low chime is repeated three times through all loudspeakers
- Depending on the aircraft configuration, the ON light and the CALL light comes on.

For an emergency call from the cabin to the cockpit:
- The CALL light flashes
- The ATT light flashes on all ACPs
- The buzzer is repeated three times in the cockpit (for approximately three seconds each).

The cabin call system resets when a cabin crewmember hangs up the associated handset.

ATTND adv pb ⋞



When pressed, the ON light comes on. A green light on the attendant area call panel comes on. This pushbutton is used to inform cabin crew in the case of imminent takeoff or landing.

DESCRIPTION

Ident.: DSC-23-30-10-00018475.0001001 / 17 MAR 17

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

Either of the two Radio Management Panels (RMPs) (third RMP ◁) can be used to tune each transceiver.
To transmit, the flight crew uses the Audio Control Panel (ACP) to select a VHF or HF system. The ACP works through the Audio Management Unit (AMU). Each system is connected to the RMPs, for frequency selection, and to the AMU for connection to the audio integrating and SELCAL (selective calling) systems.

DESCRIPTION

2 Ident.: DSC-23-30-10-00018475.0002001 / 25 MAY 20
Applicable to: MSN 11482-11597

Either of the two Radio Management Panels (RMPs) (third RMP ◁) can be used to tune each transceiver and select a VHF or HF system.
The RMP works through the Audio Management Unit (AMU), for frequency selection, and for connection to the audio integrating and SELCAL (selective calling) systems.

VHF

Ident.: DSC-23-30-10-00018472.0001001 / 27 APR 17

3 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

Two identical VHF communication systems (third VHF system ◁) are installed.
Each system has a transceiver in the avionics compartment, and an antenna on the fuselage. Only VHF1 functions in EMER ELEC CONFIG. Its range is from 118.0 to 136.975 MHz.

VHF

4 Ident.: DSC-23-30-10-00018472.0002001 / 25 MAY 20
Applicable to: MSN 11482-11597

The communication system has two VHF (third VHF system ◁) channels, and each channel has its own antenna.
Each VHF transceiver operates within a frequency band that ranges from 118.000 MHz to 136.975 MHz, by increments of 8.33 kHz.
VHF 1 and VHF 2 are for short-range communication in voice mode only.
VHF 3 ◁ is mainly for short-range communication in data mode. VHF 3 ◁ can be a backup for communication in voice mode.

L2 Data communication is automatically transferred to the SATCOM ⊲✳ if:
- VHF 3 ⊲✳ is in voice mode, or
- The aircraft is outside the range of a VHF station.

HF

Ident.: DSC-23-30-10-00018473.0001001 / 27 OCT 17

5 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06163-06165, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-09324, 10949-11293**

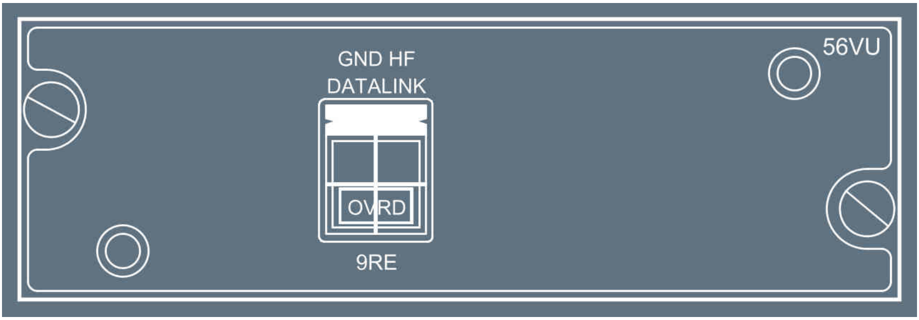
Two identical HF communication systems are optional. Each has a transceiver in the avionics compartment, and a coupler (located in AFT fuselage) and antenna in the vertical stabilizer. Its range is from 2.8 to 24 MHz.
If the HF is used on ground, it is important to check that nobody stays in the direct vicinity of the antenna. HF must not be used during refueling or transfer operation.
The HF VOICE MODE is not inhibited on ground but the use of HF on ground must be limited to operational needs.

HF

Ident.: DSC-23-30-10-00018473.0003001 / 27 OCT 17

6 **Applicable to: MSN 06139, 06173, 06528-06561, 06598, 06634, 06689-06712, 06800-06876, 11482-11597**

Two identical HF communication systems are optional. Each has a transceiver in the avionics compartment, and a coupler (located in AFT fuselage) and antenna in the vertical stabilizer. Its range is from 2.8 to 24 MHz.
If the HF is used on ground, it is important to check that nobody stays in the direct vicinity of the antenna. HF must not be used during refueling or transfer operation.
The HF DATA transmission is inhibited on ground. A GND HF DATALINK pb, located on the overhead panel, enables to override the inhibition. .
The HF VOICE MODE is not inhibited on ground but the use of HF on ground must be limited to operational needs.



SELCAL (SELECTIVE CALLING)

Ident.: DSC-23-30-10-00018476.0001001 / 17 MAR 17

7 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

Upon receiving a call code corresponding to that of the aircraft, the SELCAL system aurally and visually advises the flight crew that a ground station is calling the aircraft.
The aural warning is inhibited during takeoff and landing.

SELCAL

8 Ident.: DSC-23-30-10-00018476.0002001 / 25 MAY 20
Applicable to: MSN 11482-11597

In order to help the selection of the numerous VHF or HF ◁ messages, the Selective Calling (SELCAL) identifies incoming VHF or HF ◁ calls that have the aircraft-specific SELCAL code. SELCAL then triggers visual and aural alerts:

- On the RMP, the corresponding VHF or HF ◁ transmission key flashes in amber and the RESET SELCAL RMP message appears (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*)
- On the ACP ◁ , the RESET key flashes
- A buzzer sounds in the cockpit until the flight crew presses the RMP R4 key (or the SELCAL/Call RESET key on the ACP ◁), or the flight crew answers the call.

Note: *The buzzer sounds when an incoming call is identified, regardless of the setting of the loudspeaker volume, but is inhibited during takeoff and landing.*

Intentionally left blank

General

GENERAL

Ident.: DSC-23-30-20-10-00019717.0001001 / 17 MAR 17

Applicable to: MSN 01143-01376, 01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02734, 02896-03002, 03035-03710, 03733-04544, 04570-04974, 05066, 05101-05883, 06409-06414, 06592, 06632, 06658-06685, 06718-06798, 06895-07098

The Satellite Communication (SATCOM) system allows the exchange of information between the aircraft and a ground network.

It provides both voice and data channels:
- One or several channels are used for voice transmissions (cockpit or cabin voice). The cockpit voice function must be activated, in order to be available. The cabin telephone system must be installed, to be able to use cabin voice function.
- One channel is used for data transmissions (ATSU or ACARS).
  The ATSU or ACARS normally transmit via VHF3. They automatically switch to SATCOM when VHF3 is not available.

The cockpit voice interface is controlled by the Audio Control Panels (ACPs) for call set-up and call termination, and by the MCDU for the call number selection. It allows the crew:
- To initiate air to ground calls and to receive ground to air calls
- To select the call priority, in case of air to ground calls
- To use manual dial or pre-recorded phone numbers.

If a SATCOM telephone handset is installed in the cockpit, the crew can set up a call without the use of the MCDU.
SATCOM functions are programmed through the Owner Requirement Table (ORT), according to airline needs.
Due to the highly customized programming, the SATCOM functions may vary for different airlines and are, therefore, not described in detail.

Amplitude Modulation Display

The illustration indicates:
- HF 2 is in transmission (AM mode) and reception mode (loudspeaker symbol)
- The active frequency is 5.200 MHz
- The Standby Frequency is boxed to indicate that it is selected for modification.

ACTIVE FREQUENCY

5.200	The HF transceiver is tuned on the displayed frequency. The flight crew can press the RMP L1 or L2 key to swap the Active frequency and the Standby frequency.
- - . - - -	The HF transceiver is in voice mode, and is either failed or not available.
DATA	The HF transceiver is in data mode (HF Datalink ◁).
DATA DISCONNECTING	The flight crew pressed the RMP L1 or L2 key, the DATA is disconnecting (HF Datalink ◁). After disconnection, the DATA and the Standby Frequency are swapping.

	The HF transceiver is in data mode (HF Datalink ◁), and is either failed or not available.
	The RMPs are not synchronized, or an internal failure has occurred.

TRANSCEIVER IDENTIFICATION

	HF 1(2) is not in transmission mode.
	HF 1(2) is in transmission mode.

LOUDSPEAKER SYMBOL

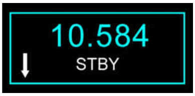
	When there is no display, indicates that reception mode is off.
	The active frequency is in reception mode.
	The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

AMPLITUDE MODULATION DISPLAY

	When there is no display, indicates that Single Side Band (SSB) mode is active.
	Amplitude Modulation (AM) mode is active.

STANDBY FREQUENCY

L12



The flight crew presses the RMP R1 or R2 key and selects the HF 1(2) Standby frequency for modification.

A voice standby frequency displays:
- In large characters until the flight crew validates it
- In small characters after validation.

Note: *After a flight crew modifies the Standby Frequency, they should validate it, in order to prevent inadvertent modification of the frequency.*

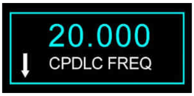
The current HF 1(2) Standby frequency is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew swaps the Active frequency and the related Standby frequency, or
- The flight crew selects another Standby frequency, or
- The flight crew displays another RMP page, or
- The flight crew presses one of the scroll keys, or
- Automatically when the frequency is complete and valid.

If at validation, the HF frequency is not complete, then all of the following occur:
- The current HF frequency remains selected
- The HF1(2) FREQ NOT COMPLETE RMP message is displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

The up-arrow and the down-arrow indicate that the list of frequencies can be scrolled up, or down.

The list contains the following frequencies:
- Modifiable frequency
- DATA (HF Datalink ◁✳)
- Emergency frequency 8.364 MHz.

When the flight crew enters a frequency, via the numerical keypad, the modifiable frequency appears automatically whatever the current display.
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key , in order to remove all the entered digits and display the previous valid HF frequency.

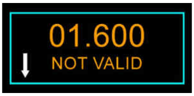


20.000
↓ CPDLC FREQ

In case of CPDLC frequency upload, the flight crew pressed the RMP R4 key to load the CPDLC frequency into the RMP.

5.200

The flight crew validated the Standby Frequency. No modification is possible. The flight crew should select the appropriate RMP key to modify the Standby Frequency.



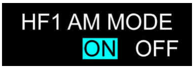
01.600
↓ NOT VALID

The Standby Frequency is not a standard HF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the Standby Frequency displays in cyan again.

- - . - - -

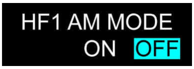
The RMPs are not synchronized.

AMPLITUDE MODULATION FUNCTION



HF1 AM MODE
ON OFF

HF 1(2) is in AM mode. When the flight crew presses the RMP R3 key, the SSB mode activates.



HF1 AM MODE
ON OFF

HF 1(2) is in SSB mode. When the flight crew presses the RMP R3 key, the AM mode activates.

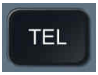
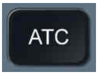
Indicates that the associated system is not installed.

Displays the VHF page (*Refer to DSC-23-45-10 VHF Page*).

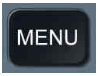
Displays the HF page (*Refer to DSC-23-45-10 HF (If Installed) Page*).



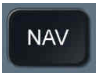
Displays the TEL page (SATCOM ◁✳) (*Refer to DSC-23-45-10 TEL Page*).



Displays the ATC page with XPDR and TCAS data.
For the XPDR part *Refer to DSC-34-SURV-10-20 Control Panels* .
For TCAS part *Refer to DSC-34-SURV-60-20 ATC/TCAS Panel* .



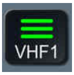
Displays the MENU page (*Refer to DSC-23-45-10 MENU Page*).



Displays the NAV page (*Refer to DSC-34-NAV-30-30 NAV Page*).

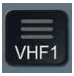
EXTERNAL TRANSMISSION KEYS AND RECEPTION KNOBS

VHF TRANSMISSION KEYS

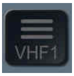


The associated communication means (i.e. VHF 1(2)(3)) is in transmission mode. When pressed, the transmission key turns off the transmission mode.

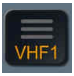
Note: *Only one communication means at a time (internal and external communication) can be in transmission mode on each RMP.*



The associated communication means (i.e. VHF 1(2)(3)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode.

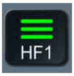


Indicates that the associated communication means (i.e. VHF 1(2)(3)) is not installed.

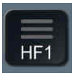


Flashes to indicate an incoming SELCAL.
When a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via the RMP R4 key.

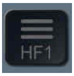
HF TRANSMISSION KEYS



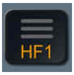
The associated communication means (i.e. HF 1(2) ◁✳) is in transmission mode. When pressed, the transmission key turns off the transmission mode.



The associated communication means (i.e. HF 1(2) ◁✳) is not in transmission mode. When pressed, the transmission key turns off the transmission mode.

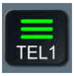


Indicates that the associated communication means (i.e. HF 1(2) ◁✳) is not installed.

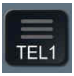


Flashes to indicate an incoming SELCAL.
When a SELCAL is received, a buzzer sounds in the cockpit until it is reset, via the RMP R4 key.

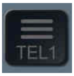
TEL TRANSMISSION KEYS



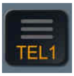
The associated communication means (i.e. TEL 1(2) (SATCOM ◁)) is in transmission mode. When pressed, the transmission key turns off the transmission mode.



The associated communication means (i.e. TEL 1(2) (SATCOM ◁)) is not in transmission mode. When pressed, the transmission key turns on the transmission mode.



Indicates that the associated communication means (i.e. TEL 1(2) (SATCOM ◁) is not installed.



Flashes to indicate an incoming CALL.
When a CALL is received, a buzzer sounds in the cockpit until it is reset, via the RMP R4 key.

RECEPTION KNOBS

The associated communication means or interphone (i,e, VHF 1(2)(3), HF 1(2) ◁ , TEL 1(2) (SATCOM ◁)) is not in reception mode.
When pressed and released in the out position, the reception knob turns on the reception mode.

The associated communication means or interphone (i.e. VHF 1(2)(3), HF 1(2) ◁ , TEL 1(2) (SATCOM ◁)) is in reception mode.
When turned, the reception knob adjusts the volume of the headsets and the loudspeakers.
When pressed and released in the in position, the reception knob turns off the reception mode.

SCROLL KEYS

UP KEY

- When pressed and released, scrolls up a list of items provided that an up-arrow is displayed in the field that is selected for modification
- When pressed and maintained, displays the first item of the list.

DOWN KEY

- When pressed and released, scrolls down a list of items provided that a down-arrow is displayed in the field that is selected for modification
- When pressed and maintained, displays the last item of the list.

NUMERICAL KEYPAD

NUMBER KEYS

When pressed, inserts the corresponding number at the cursor position, in the field selected for modification.

DECIMAL KEY

When pressed, inserts a decimal.
The decimal is automatically entered where necessary.

CLR KEY

- When pressed and released, clears the last digit
- When pressed and maintained, clears the field selected for modification, and displays the last validated entry.

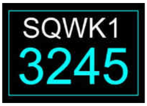
The Common Area can be displayed on the following radio pages:

- VHF Page
- HF ◁✻ Page
- TEL (SATCOM ◁✻) Page
- ATC Page.

Squawk Code



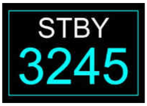
The XPDR 1(2) is in AUTO mode.
The flight crew presses the RMP L4 key and selects the Squawk code for modification. Each digit of the Squawk code must be in the range from 0 to 7.

The current SQWK code is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew presses another RMP key, or
- The flight crew enters a last digit of the Squawk code.

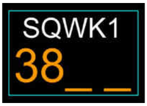
When the flight crew enters a Squawk code, the system does not complete the code. Underscore "_" are displayed in place of net yet entered digits.

If at validation, the Squawk code is not complete, then all of the following occur:
- The squawk code reverts to the previous valid code
- The **SQWK REVERTED TO PREV ENTRY** RMP message appears (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

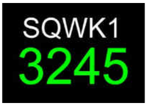
The flight crew can clear a digit , via the CLR key.
The flight crew can press and maintain the CLR key, in order to remove all the entered digits and display the previous valid Squawk code.
The SQWK REVERTED TO PREV ENTRY RMP message is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).



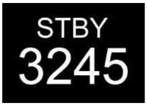
The XPDR is in standby mode.
The flight crew presses the RMP L4 key and selects the Squawk code for modification. Each digit of the Squawk code must be in the range from 0 to 7.



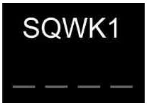
The flight crew enters an erroneous digit in the SQWK code. They can clear the erroneous digits, via the CLR key, until the SQWK code displays in cyan again.
The SQWK CODE NOT VALID RMP message is also displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).



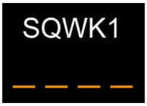
The XPDR 1(2) is in AUTO mode and responds to requests.



The XPDR is in standby mode and does not respond to requests from ATC, nor to other aircraft.



The RMPs are not synchronized or an internal failure has occurred.



XPDR 1(2) is failed.

TCAS Display

The NORM (ABV, BLW) TCAS display mode is selected with all of the following conditions:

- The selected XPDR is in AUTO mode, and
- The TCAS is in TA/RA or TA mode.

The flight crew can press the left TCAS Generic key to change the mode selection.

The flight crew can select the THRT TCAS display mode only on the ATC page (*Refer to DSC-34-SURV-10-20 Control Panels*).

The NORM (ABV, BLW) TCAS display mode is selected with one of the following conditions:

- Tthe selected XPDR is in STBY mode, or
- The TCAS is in STBY mode, or
- The altitude data transmission (ALT RPTG) is not activated.

The flight crew cannot change the mode selection.

The link between RMP1 and AMU is failed. The flight crew cannot modify the TCAS display.

The related XPDR is failed. The flight crew cannot modify the TCAS display.

TCAS Mode

The TA (TA/RA, STBY) TCAS mode is selected with the selected XPDR in AUTO mode.
The TA/RA, STBY (TA) TCAS mode are not selected. The flight crew can press the right TCAS Generic key to change the mode selection.
On ground, the flight crew can select all TCAS modes.

In flight:
- The flight crew can only select TA or TA/RA TCAS modes.
- The flight crew can select the STBY TCAS mode only on the ATC page (*Refer to DSC-34-SURV-10-20 Control Panels*).

The TA (TA/RA, STBY) TCAS (ABV, BLW) TCAS display mode is selected with one of the following conditions:
- The TCAS is in STBY mode, or
- The altitude data transmission (ALT RPTG) is not activated.

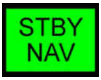
The flight crew cannot change the mode selection.

The link between RMP1 and AMU is failed. The flight crew cannot modify the TCAS mode.

The related XPDR is failed. The flight crew cannot modify the TCAS mode.

NAV Status

L12



The NAV status is in STBY mode.
Displayed only on RMP1 and RMP2.

Message Area

Refer to DSC-23-45-20 RMP Messages on the RMP Message Area.

PASSENGER ADDRESS FUNCTION

Refer to DSC-23-20-40 Description.

INT/RAD SWITCH

The flight crew uses the interphone/Radio Push-To-Talk switch (INT/RAD sw) to activate the boomset or oxygen mask microphones.

The switch on:
- RMP 1 controls the microphones for the Captain
- RMP 2 controls the microphones for the First Officer
- RMP 3 ◁ controls the microphones for the third occupant.

The INT/RAD sw is in the off position.

- When set to RAD, the INT/RAD sw activates the boomset or the oxygen mask microphone. However, the appropriate key should be selected first, in order to transmit the message
- When released, the INT/RAD sw returns to the off position.

- When set to INT, the INT/RAD sw activates the boomset or the oxygen mask microphone
- When released, the INT/RAD sw remains in the INT position, until the flight crew selects another switch position.

BRT/OFF KNOB

Turn the BRT/OFF knob to adjust the brightness level of the screen.

Set to OFF the BRT/OFF knob to switch off the RMP.

EXTERNAL COMMUNICATION CONTROLS AND INDICATORS

Refer to DSC-23-45-10 RMP External Communication

NAV RECEPTION KNOB

Refer to DSC-34-NAV-30-30 NAV Page

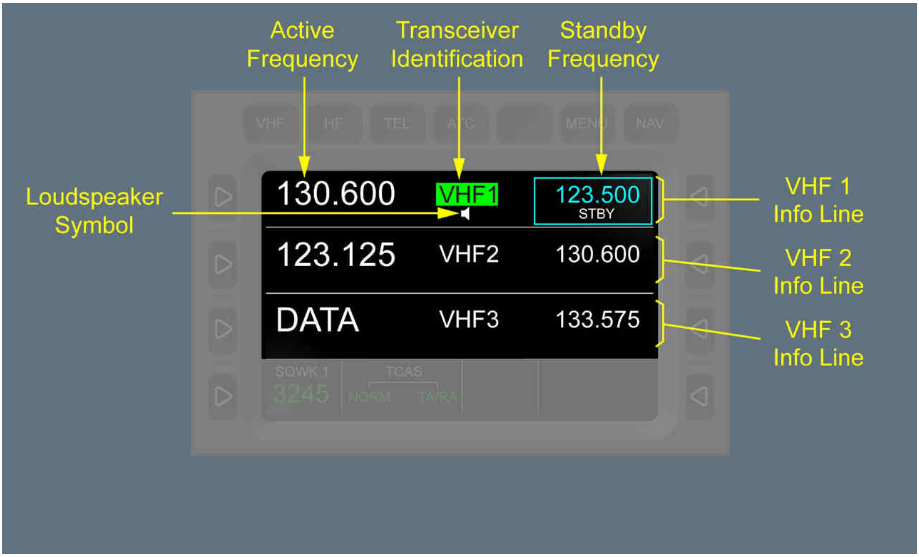
TCAS GENERIC KEYS

The flight crew selects the left TCAS Generic key to modify the TCAS display mode selection.
The flight crew selects the right TCAS Generic key to modify the TCAS mode selection.
For the use of the TCAS Generic Keys, *Refer to DSC-23-45-10 RMP External Communication*

VHF PAGE

5 Ident.: DSC-23-45-10-00022707.0001001 / 25 MAY 20
Applicable to: MSN 11482-11597

L2 After an RMP power-up or reset, or after deactivation of the RAD NAV STBY mode, the RMP displays the VHF page by default.



Active Frequency
Transceiver Identification
Standby Frequency

L1 The illustration indicates:

- VHF 1 is in transmission (transceiver identification in reverse video) and reception mode (loudspeaker symbol)
- The VHF 1 Active Frequency is 130.600 MHz
- The VHF 1 Standby Frequency is 123.500 MHz and is boxed to indicate that it is selected for modification
- VHF 2 and VHF 3 is neither in transmission nor in reception mode.

ACTIVE FREQUENCY

VHF is tuned on the displayed frequency.
The flight crew can press the RMP L1, L2 or L3 key to swap the Active frequency and the Standby frequency.

VHF is in voice mode, and is either failed or not available.

FOR VHF 3 ONLY

DATA	DATA mode is active.
DATA DISCONNECTING	The flight crew pressed the RMP L3 key, the DATA mode is disconnecting. After disconnection, the DATA and the Standby Frequency are swapping.

TRANSCEIVER IDENTIFICATION

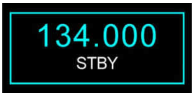
VHF1	VHF 1(2)(3) is not in transmission mode.
VHF1	VHF 1(2)(3) is in transmission mode.

LOUDSPEAKER SYMBOL

■	When there is no display, indicates that reception mode is off.
🔈	The active frequency is in reception mode.
🔇	The active frequency is in transmission mode, but not in reception mode. When the flight crew turns on the transmission mode only, the symbol flashes for 2 s, and then remains steady.

STANDBY FREQUENCY

L12



The flight crew pressed the RMP R1, R2 or R3 key. The flight crew can modify the Standby Frequency.

A voice standby frequency appears:
- In large characters until it is inserted, via the appropriate RMP key
- In small characters after insertion.

Note: *After a flight crew modifies the Standby Frequency, they should insert it, in order to prevent inadvertent modification of the frequency.*

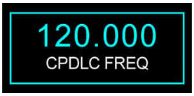
The current VHF 1(2)(3) Standby frequency is validated and deselected when one of the following occurs:
- The flight crew presses again on the related RMP key, or
- The flight crew swaps the Active frequency and the related Standby frequency, or
- The flight crew selects another Standby frequency, or
- The flight crew displays another RMP page, or
- The flight crew presses one of the scroll keys, or
- Automatically when the frequency is complete and valid.

If at validation, the VHF frequency is not complete, then all of the following occur:
- The current VHF frequency remains selected
- The VHF1(2)(3) FREQ NOT COMPLETE RMP message is displayed (*Refer to DSC-23-45-20 RMP Messages on the RMP Message Area*).

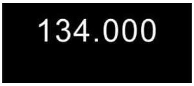
The up-arrow and the down-arrow indicate that the list of frequencies can be scrolled up, or down.

The list contains the following frequencies:
- Modifiable frequency
- DATA (VHF Datalink ◁)
- Emergency frequency 121.500 MHz.

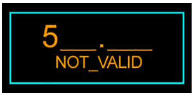
When the flight crew enters a frequency, via the numerical pad, the modifiable frequency appears automatically whatever the current display.
The flight crew can clear a digit, via the CLR key.
The flight crew can press and maintain the CLR key , in order to remove all the entered digits and display the previous valid VHF frequency.



In case of CPDLC frequency upload, the flight crew pressed the RMP R4 key. The DRMP is loading the CPDLC frequency into the RMP.



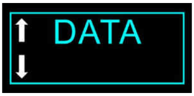
The flight crew validated the Standby Frequency. No modification is possible. The flight crew should select the appropriate RMP key to modify the Standby Frequency.



The modified standby frequency is not a standard VHF voice frequency. The flight crew can clear the erroneous digits, via the CLR key, until the standby frequency displays in blue again. The VHF1(2) FREQ NOT COMPLETE RMP message is also displayed.

FOR VHF 3 ONLY

L12



The flight crew pressed RMP R3 key. When boxed, the standby frequency can be modified.

The standby frequency (except DATA) appears:
- In large characters until it is inserted, via the appropriate RMP key.
- In small characters after insertion.

Note: *After a flight crew modifies the Standby Frequency, they should insert it, in order to prevent inadvertent modification of frequency.*

When entering a frequency, the system assists you and completes the digits of the frequency.
The up-arrow and the down-arrow indicate that the flight crew can use the up and down keys to scroll through the list of frequencies.

The list contains the following frequencies:
- The modifiable frequency
- DATA
- 121.500 MHz.

When the flight crew enters a frequency, via the numerical pad, the modifiable frequency appears automatically whatever the current display.

Intentionally left blank

RMP MESSAGES ON THE RMP PAGE AREA

1 Ident.: DSC-23-45-20-00024140.0001001 / 25 MAY 20
Applicable to: MSN 11482-11597

The following messages are displayed on the whole RMP page area.

Message	Condition
HF PAGE NOT AVAIL	This message is displayed in HF page on RMP1 when communication between RMP1 and AMU is failed.
MENU PAGE NOT AVAIL	This message is displayed in MENU page on RMP1 when communication between RMP1 and AMU is failed.
NAV PAGE NOT AVAIL	This message is displayed in NAV page on RMP1 when communication between RMP1 and AMU is failed.
RMP2(3) NOT AVAIL	This message is displayed on RMP2/RMP3 when communication between RMP2/RMP3 and AMU is failed.
TEL PAGE NOT AVAIL	This message is displayed in TEL page (SATCOM) on RMP1 when communication between RMP1 and AMU is failed.
TEST IN PROGRESS	This message is displayed when the aircraft is on ground and RMP is started after a power cut of more than 5 s.
VHF PAGE NOT AVAIL	This message is displayed in VHF page on RMP1 when communication between RMP1 and AMU is failed.

RMP MESSAGES ON THE RMP MESSAGE AREA

2 Ident.: DSC-23-45-20-00022683.0001001 / 25 MAY 20
Applicable to: MSN 11482-11597

The RMP displays messages to inform the flight crew, when:
- An action is not appropriate, or not complete, or
- A connection is failed, or
- Voice or data mode is not available.

L3 An RMP message can be displayed on all RMPs simultaneously (global display), or on one RMP only (local display). However, some local messages can be displayed on more than one RMP, provided that the same page is displayed.
RMP messages are displayed according to their priority levels.
If several messages with different priority levels can be displayed, the message with the highest priority is displayed first.
If several messages with the same priority levels can be displayed, the most recent one is displayed first.
The flight crew must check, and clear the active messages, one by one, in order to cancel the queue.
L1 The various RMP communication messages are listed below:

Message	Priority	Condition
🔈 ADF1(2)	3	On ADF page, the ADF1(2) is activated in reception mode.
ADF1(2) FREQ NOT COMPLETE	1	The flight crew tries to validate a frequency that is not complete.
DATA FIELD NOT MODIFIABLE	1	The flight crew tries to modify a field, that cannot be modified.
DIALING NOT ALLOWED	1	On TEL page, the flight crew enters a telephone number on TEL1(2) Channel Info while connection/disconnection is in progress or TEL1(2) is connected.
GLS CHAN NOT COMPLETE (GLS ◁)	1	The flight crew tries to validate a channel that is not complete.
GLS CRS NOT COMPLETE (GLS ◁)	1	The flight crew tries to validate a course that is not complete.
HF1(2) DATA MODE NOT AVAIL (HF ◁)	1	The flight crew tries to activate the DATA mode on HF1(2) but the data mode is not available.
HF1(2) FREQ NOT COMPLETE (HF ◁)	1	The flight crew tries to validate a frequency that is not complete.
HF1(2) NOT INSTALLED (HF ◁)	1	The flight crew selects the HF Main Page Access key or the HF1(2) transmission key whereas the HF1(2) system is not installed.
HF1(2) RECEPTION NOT SELECTED (HF ◁)	1	The flight crew selects the HF1(2) transmission key whereas the HF2(1) reception knob is selected. No PTT is activated.
HF1(2) RECEPTION NOT SELECTED (HF ◁)	1	The flight crew selects the HF1(2) transmission key whereas the HF2(1) reception knob is selected. One PTT is activated.
HF1(2) STBY REVERTED TO PREV ENTRY (HF ◁)	1	On HF page, the flight crew attempts to manually validate an erroneous or incomplete HF frequency. The entry from the flight crew is replaced by the previous valid HF frequency.
HF1(2) VOICE MODE NOT AVAIL (HF ◁)	1	On HF page, the flight crew tries to activate HF1(2) in voice mode, but the voice mode is not available.
ILS CRS NOT COMPLETE	1	On LS page, the flight crew tries to validate a course that is not complete.
ILS FREQ NOT COMPLETE	1	On LS page, the flight crew tries to validate a frequency that is not complete.
LIST NUMBER NOT VALID	1	On TEL DIRECTORY page, the flight crew enters an invalid Telephone Number item.
LOAD XX.XXXX ON HF	1	On HF page, the flight crew can press the RMP R4 key to load the received CPDLC frequency in the selected STBY frequency. XX.XXXX is replaced by the digits of the received CPDLC frequency.

Continued on the following page

Continued from the previous page

Message	Priority	Condition
LOAD XXXXXX ON TEL	1	On TEL page, the flight crew can press the RMP R4 key to load the received CPDLC telephone number in the selected Telephone Information. XXXXXX is replaced by the digits of the received CPDLC telephone number.
LOAD XXX.XXX ON VHF	1	On VHF page, the flight crew can press the RMP R4 key to load the received CPDLC frequency in the selected STBY frequency. XXX.XXX is replaced by the digits of the received CPDLC frequency.
LOG OFF TO MODIFY SATCOM SETTINGS	1	On SATCOM SETTINGS page, the flight crew tries to modify entries from the SAT zone or from the GES zone while the SATCOM Connection Status is LOGGED (AUTO or MANUAL).
🔈 LS	3	On LS page, the ILS, GLS ◁✱ or MLS ◁✱ is activated in reception mode.
🔈 MKR	3	The MKR is activated in reception mode.
MLS CHAN NOT COMPLETE (MLS ◁✱)	1	The flight crew tries to validate a channel that is not complete.
MLS CRS NOT COMPLETE (MLS ◁✱)	1	The flight crew tries to validate a course that is not complete.
NO NUMBER DIALED	1	On TEL page, the flight crew tries to make a telephone call by This message is displayed when the flight crew triggers a phone connection while no number has been dialed.
PLEASE WAIT	1	The load of the content of a displayed field is progress.
RESET CABIN	1	This message is displayed when a CALL is received.
RESET CALL	1	This message is displayed when a CALL is received.
RESET MECH	1	This message is displayed when a CALL is received.
RESET SELCAL	1	This message is displayed when a SELCAL is received.
SATCOM LOG ON FAILED	2	On the SATCOM Settings page, the flight crew tries to log on the SATCOM, but the log on fails.
SQWK CODE NOT VALID	1	The flight crew enters an erroneous SQWK code.
SQWK REVERTED TO PREV ENTRY	1	The flight crew attempts to manually validate an erroneous or incomplete SQWK code. The flight crew entry is replaced by the previous valid SQWK code.

Continued on the following page

Continued from the previous page

Message	Priority	Condition
TEL1(2) BUSY	1	On TEL page, the flight crew presses the RMP R4 key to load the received CPDLC telephone number while connection/disconnection is in progress or TEL1(2) is already connected.
TEL1(2) CONNECTION FAILED	2	On TEL page, the flight crew tries to make a telephone call, but it cannot be established or it is interrupted due to a failure.
TEL CONTROL THROUGH MCDU	1	The flight crew presses the TEL1(2) transmission key whereas the SATCOM is managed by the MCDU.
TEL NBR NOT IN DIRECTORY	1	On TEL page, the flight crew enters an telephone number which does not belong to the Telephone Number List.
TEL1(2) NOT CONNECTED	1	The flight crew selects the TEL1(2) transmission key whereas no TEL1(2) connection is established.
TEL1(2) NOT INSTALLED	1	The flight crew selects the TEL Main Page Access key or the TEL1(2) transmission key whereas the TEL system is not installed.
TEL1(2) RECEPTION NOT SELECTED	1	The flight crew selects the TEL1(2) transmission key whereas the TEL2(1) reception knob is selected. No PTT is activated.
TEL1(2) RECEPTION NOT SELECTED	1	The flight crew selects the TEL1(2) transmission key whereas the TEL2(1) reception knob is selected. One PTT is activated.
TEL1(2) REVERTED TO PREV ENTRY	1	On TEL page, the flight crew attempts to manually validate an erroneous or incomplete telephone number. The entry from the flight crew is replaced by the previous valid telephone number.
TEL1(2) STILL CONNECTED	1	Within the last 2 min, the flight crew selects the TEL2(1) transmission key whereas TEL1(2) is connected.
TEL1(2) STILL CONNECTED	1	For more than 2 min, the flight crew selects the TEL2(1) transmission key whereas TEL1(2) is connected.
UPDATE MMR ON ALL RMP	1	On LS page, in the case of an RMP synchronization failure, the flight crew must update each modified data on each RMP.
UPDATE ATC ON ALL RMP	1	On ATC page, in the case of an RMP synchronization failure, the flight crew must update each modified data on each RMP.
VHF1(2)(3) DATA MODE NOT AVAIL	1	The flight crew tries to activate the DATA mode on VHF1(2)(3) but the data mode is not available.
VHF1(2)(3) FREQ NOT COMPLETE	1	The flight crew tries to validate a frequency that is not complete.

Continued on the following page

Continued from the previous page

Message	Priority	Condition
VHF1(2)(3) RECEPTION NOT SELECTED	1	The flight crew selects the VHF1(2)(3) transmission key whereas the VHF2(3)(1) reception knob is selected. No PTT is activated.
VHF1(2)(3) RECEPTION NOT SELECTED	1	The flight crew selects the VHF1(2)(3) transmission key whereas the VHF2(3)(1) reception knob is selected. One PTT is activated.
VHF1(2) STBY REVERTED TO PREV ENTRY	1	On VHF page, the flight crew attempts to manually validate an erroneous or incomplete VHF frequency. The entry from the flight crew is replaced by the previous valid VHF frequency.
🔈 VOR1(2)	3	On VOR page, the VOR1(2) is activated in reception mode.
VOR1(2) CRS NOT COMPLETE	1	The flight crew tries to validate a course that is not complete.
VOR1(2) FREQ NOT COMPLETE	1	The flight crew tries to validate a frequency that is not complete.

VHF, HF UTILIZATION

Ident.: DSC-23-60-A-00002211.0001001 / 05 MAR 18

1 **Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321, 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11293**

TUNING

The pilot should normally use his onside RMP to tune any one of the VHF or HF radios.
If a frequency is tuned on the RMP not dedicated to its associated VHF (e.g. VHF 1 tuned on RMP 2), the SEL lights come on (on the 3 RMP) to remind the pilot at least one radio system is not selected on its associated RMP. After each tuning, in order to be able to read VHF 1 and VHF 2 frequencies, the pilot should select the radio system associated with his RMP, this will extinguish the SEL lights.

Note:

1. *If ACARS is installed, do not use VHF 3 for voice communications with ATC, unless VHF 1 and VHF 2 are inoperative.*
2. *If the VHF 3 VOICE DIRECTORY page is customized with user frequencies:*
   - *Use it as a pure directory*
   - *Do not press the key adjacent to the desired frequency for direct tuning*
   - *VHF 3 in VOICE mode should either be tuned using the MANUAL FREQ field, or using the RMP.*
3. *If two frequencies are closer than 2 MHz (between VHF 1 and 2, or between VHF 2 and 3), or closer than 6 MHz (between VHF 1 and 3), some interference may occur.*
4. *If interference occurs, use VHF 2 for voice communication with ATC. The flight crew can also switch VHF 3 to VOICE.*

GENERAL

Ident.: DSC-24-10-10-00017750.0001001 / 21 MAR 16
Applicable to: ALL

The electrical power system consists of a three-phase 115/200 V 400 Hz constant-frequency AC system and a 28 V DC system. Electrical transients are acceptable for equipment. Commercial supply has secondary priority.
In normal configuration, the electrical power system provides AC power. The electrical power system is constituted of 2 engine generators and 1 APU generator. Each generator can provide AC power to all electrical bus bars. A part of this AC power is converted into DC power for certain applications.
In the event that normal AC power is not available, an emergency generator can provide AC power.
In the event that all AC power is not available, the electrical power system can invert DC power from the batteries into AC power.

AC GENERATORS

Ident.: DSC-24-10-20-00017751.0001001 / 21 MAR 16
Applicable to: ALL

ENGINE – DRIVEN GENERATORS

Two AC generators (GEN 1, GEN 2), one driven by each main engine through an integrated drive, supply aircraft electrical power. Each generator can supply up to 90 KVA of three phase 115/200 V 400 Hz power.

Two Generators Control Units (GCU) control the output of their respective generator. The main functions of each GCU are :
- Control the frequency and voltage of the generator output.
- Protect the network by controlling the associated generator line contactor.

APU GENERATOR AND EXTERNAL POWER

A third generator (APU GEN), driven directly by the APU and producing the same output as each main engine generator, can replace either or both main engine generators at any time.
A ground power connector near the nosewheel allows ground power to be supplied to all busbars.

A Ground Power Control Unit (GPCU) :
- Protects the network by controlling the external power contactor, or

A Ground and Auxiliary Power Control Unit (GAPCU) ◁ :
- Regulates, via the APU Electronic Control Box, the frequency and voltage of the APU generator.
- Protects the network by controlling the external power contactor and the APU generator line contactor.

EMERGENCY GENERATOR

The blue hydraulic circuit drives an emergency generator that automatically supplies emergency AC power to the aircraft electrical system, if all main generators fail. This generator supplies 5 KVA of three-phase 115 and 200 V 400 Hz power.

A Generator Control Unit (GCU) :
- Keeps the emergency generator at a constant speed,
- Controls the generator's output voltage,
- Protects the network by the controlling the emergency generator line contactor, and
- Controls the emergency generator start-up.

STATIC INVERTER

A static inverter transforms DC power from Battery 1 into one KVA of single-phase 115 V 400 Hz AC power, which is then supplied to part of the AC essential bus. When the aircraft speed is above

50 kt, the inverter is automatically activated, if only the batteries are supplying electrical power to the aircraft, regardless of the BAT 1 and BAT 2 pushbutton positions.
When the aircraft speed is below 50 kt, the inverter is activated, if only the batteries are supplying electrical power to the aircraft, and both BAT 1 and BAT 2 pushbuttons are on.

DC GENERATION

Ident.: DSC-24-10-20-00017752.0001001 / 21 MAR 16
Applicable to: ALL

TRANSFORMER RECTIFIERS (TRS)

Two main transformer rectifiers, TR 1 and TR 2, supply the aircraft's electrical system, with up to 200 A of DC current.
A third (identical) Transformer Rectifier, the ESS TR, can power the essential DC circuit from the emergency generator, if the engine and APU generators all fail, or if TR 1 or TR 2 fails.
Each TR controls its contactor by internal logic.
A fourth Transformer Rectifier (TR Entertainment ◁) powers the DC Entertainment bus bar dedicated to the In-Flight Entertainment system (IFE) in order to take into account IFE needs.

BATTERIES

Two main batteries, each with a normal capacity of 23 Ah, are permanently connected to the two hot buses.
Each battery has an associated Battery Charge Limiter (BCL).
The BCL monitors battery charging and controls its battery contactor.

CIRCUIT BREAKERS (C/BS)

Ident.: DSC-24-10-20-00000874.0002001 / 15 FEB 11
Applicable to: ALL

The aircraft has two types of C/Bs:
- Monitored (green): When out for more than 1 min, the C/B TRIPPED warning is triggered on the ECAM.
- Non-monitored (black).

The Wing Tip Brake (WTB) C/Bs have red caps on them to prevent them from being reset.
The C/B TRIPPED warning on the ECAM indicates the location of the affected C/B. The following panels are monitored: OVHD PNL, L(R) ELEC BAY, REAR PNL J-M or N-R or S-V or W-Z.

Note: *The flight crew can clear the ECAM C/B TRIPPED caution by pressing:*

- *The EMER CANC pb: When pressed, this pushbutton clears and inhibits the ECAM C/B TRIPPED caution for the remainder of the flight, or*
- *The CLR pb: When pressed, this pushbutton only clears the ECAM C/B TRIPPED caution. If the C/B remains pulled, any additional tripped circuit breakers on the same panel will not be detected, and the ECAM will not trigger the caution. However, if the C/B is pushed, any additional tripped circuit breakers will be detected, and the ECAM will trigger the caution again.*

Intentionally left blank

General

GENERAL

Ident.: DSC-24-10-30-10-00017759.0001001 / 21 MAR 16
Applicable to: ALL

GEN 1 and 2 when operating have priority over the APU generator and over external power.
External power has priority over the APU generator when the EXT PWR pb switch is ON.
The APU generator or external power can supply the entire network.
One engine generator can supply the entire network, except the DC BUS Entertainment.
The generators cannot be connected in parallel.

Note: *Two generators are needed to supply the DC BUS Entertainment* ◁ *, except on ground, where the APU generator (if not overloaded) or the external power is sufficient.*

Intentionally left blank

Normal Configuration

IN FLIGHT

Ident.: DSC-24-10-30-20-00000876.0001001 / 09 OCT 12
Applicable to: MSN 01143-01518, 01593-01628, 01801, 01825-01826, 01832, 01837-01855, 02014-02321

Each engine-driven generator supplies its associated AC BUS (1 and 2) via its generator line contactor (GLC 1 and GLC 2).
AC BUS 1 normally supplies the AC ESS BUS via a contactor.
TR 1 normally supplies DC BUS 1, DC BAT BUS, and DC ESS BUS.
TR 2 normally supplies DC BUS 2.
The two batteries are connected to the DC BAT BUS, if they need charging. When they are fully charged, the battery charge limiter disconnects them.

EMERGENCY GENERATION AFTER LOSS OF ALL MAIN GENERATORS

Ident.: DSC-24-10-30-30-00000882.0002001 / 21 MAR 16
Applicable to: ALL

If both AC BUS 1 and AC BUS 2 are lost and the aircraft speed is above 100 kt, the Ram Air Turbine (RAT) extends automatically. This powers the blue hydraulic system, which drives the emergency generator by means of a hydraulic motor. This generator supplies the AC ESS BUS, and the DC ESS BUS via the ESS TR.
If the RAT stalls, or if the aircraft is on the ground with a speed below 100 kt, the emergency generator has nothing to drive it. The emergency generation network automatically transfers to the batteries and static inverter, and the system automatically sheds the AC SHED ESS and DC SHED ESS buses.

When the aircraft is on ground :
- Below 100 kt, DC BAT BUS is automatically connected to the batteries.
- Below 50 kt, AC ESS BUS is automatically shed, leading to the loss of all display units.

Note: *1. During RAT extension and emergency generator coupling (about 8 s), the batteries power the emergency generation network.*
2. On ground, if only the batteries are powering the emergency generation network, APU start is only available when the speed is below 100 kt.

SMOKE CONFIGURATION

Ident.: DSC-24-10-30-30-00017764.0002001 / 21 MAR 16

6 **Applicable to: MSN 02734-03710, 03733-05987, 06097, 06121, 06139-09324, 10949-11597**

In this configuration the main busbars are shed. The electrical distribution is the same as it is in the emergency electrical configuration (loss of main generators), except the fact that in smoke configuration the fuel pumps are connected upstream of the GEN 1 line connector.

The procedure sheds approximately 75 % of electrical equipment. All equipment that remains powered is supplied via the circuit breakers on the overhead panel (except for equipment supplied by hot buses).

GALLEY pb or GALY & CAB pb

BAT 1(2) IND.

Shows battery voltage.

BAT 1(2) pb-sw

Controls the operation of the corresponding battery charge limiter.

The battery charge limiter controls automatically the connection and the disconnection of the corresponding battery to the DC BAT BUS (3 PP) by closing and opening of the battery line contactor.

- The batteries are connected to the DC BAT BUS in the following cases:
  - APU starting (MASTER SW pb-sw at ON and N less than 95 %)

    Note: The connection is limited to 3 min when the emergency generator is running.

  - Battery voltage below 26.5 V (battery charge). The charging cycle ends when battery charge current goes below 4 A.
    - ■ On ground, immediately
    - ■ In flight, after a time delay of 30 min.
  - Loss of AC BUS 1 and 2 when below 100 kt (EMER GEN not supplying).
- If AC BUS 1 and 2 are not energized and the EMER GEN is not supplying:
  - Battery 1 supplies the AC STAT INV BUS, and, if speed is greater than 50 kt, the AC ESS BUS
  - Battery 2 supplies the DC ESS BUS.

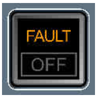
    Note: In normal configuration the batteries are disconnected most of the time.

    Note: A battery automatic cut-off logic prevents the batteries from discharging completely when the aircraft is on the ground (parking).

    Automatic battery contactors open when:
    - *The aircraft is on the ground*
    - *The BAT pb switches are at AUTO*
    - *The main power supply (EXT PWR + GEN) is cut off*
    - *Battery voltage is low.*

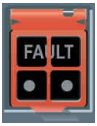
    The flight crew can reset the contactors by switching the BAT pb-sw to OFF then to AUTO.

The battery charge limiter is not operating: the battery line contactor is open. The DC BAT BUS is supplied. Hot buses remain supplied.



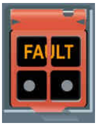
The battery charge limiter is in fault. It is accompanied by an ECAM alert, when the charging current for the corresponding battery is outside limits.
In this case the battery contactor opens.

IDG 1(2) (Integrated Drive Generator) pb-sw (GUARDED)



CAUTION	1. Maintaining the IDG pb-sw during more than 3 s may damage the IDG disconnection mechanism. 2. Disconnect the IDG only when the engine is running or windmilling. If not, the IDG will be damaged when starting the engine.

The IDG switches are normally springloaded out.
Pressing this switch disconnects the IDG from its driveshaft: only maintenance personnel can reconnect it.

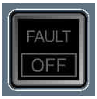


The FAULT light comes on, if:
- IDG oil outlet overheats (above 180 °C), or
- IDG oil pressure is low (inhibited at low engine speed: N2 below 14 %).

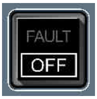
It extinguishes when the IDG is disconnected.

Note: *An automatic thermal disconnection of the IDG will occur if the temperature reaches 200 °C.*

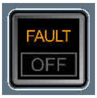
GEN 1 (2) pb-sw



The generator field is energized and the line contactor closes if electrical parameters are normal.



The generator field is de-energized and the line contactors opens.
The fault circuit is reset.

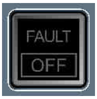


The FAULT light comes on, if:
- The associated generator control unit (GCU) trips it

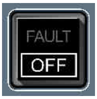
  Note: *If a differential fault trips the protection, reset action has no effect after two attempts.*

- Opening of the line contactor (except if the GEN pb-sw is selected OFF).

APU GEN pb-sw

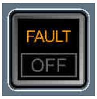


The APU generator field is energized and the line contactor closes if parameters are normal and the EXT PWR line contactor is open.
The bus tie contactor 1(2) closes automatically if GEN 1(2) is not operating.



The generator field is de-energized and the line contactor opens. The fault circuit is reset.

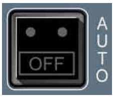
L12



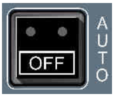
Same as GEN 1 or GEN 2 FAULT.
Associated with the following ECAM alert: ELEC APU GEN FAULT (*Refer to procedure*).
The APU GEN FAULT light is inhibited when:

- APU speed is too low, or
- The APU GEN line contactor opens after EXT PWR or ENG GEN takes over.

BUS TIE pb

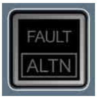


The bus tie contactors (BTCs) automatically open or close to maintain power supply to both AC BUS 1 and 2.
- One contactor is closed, when:
  - One engine generator supplies the associated AC BUS, and
  - The APU generator, or external power supplies the other side.
- Both contactors are closed during single-engine operation, or operation on the APU generator, or external power supply.

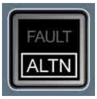


Both bus tie contactors open.

AC ESS FEED pb

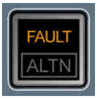


The AC ESS BUS is supplied by AC BUS 1.



The AC ESS BUS is supplied by AC BUS 2. Comes on when manually selected.

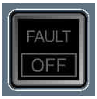
Note: *With the AC ESS FEED Auto Switching ◁, AC BUS 2 will automatically supply AC ESS BUS when AC BUS 1 is lost.*



The FAULT light come on, when the AC ESS BUS is not electrically-supplied.

Note: *In case of a total loss of the main generators, the AC ESS BUS is automatically supplied by the emergency generator, or by the static inverter, if the emergency generator is not available.*

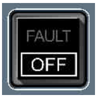
GALLEY pb OR GALY & CAB pb



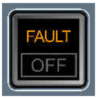
Main galley, secondary galley, in-seat power supply ◁ and IFE ◁ system (prerecorded announcement, telephone system, video/airshow, music…), are supplied.

The main galley, the in-seat power supply ◁ and the IFE ◁ systems are automatically shed:
- In flight: When only one generator is operating
- On ground: When only one engine generator is operating. (All galleys are available when the APU GEN or EXT PWR is supplying power.)

Note: *With the Galley Load Automatic Shedding ◁ the secondary galley is also automatically shed.*

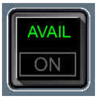


The main galley, secondary galley, in-seat power supply ◁ and IFE ◁ system (prerecorded announcement, telephone system, video/airshow, music ....) are not supplied.
The electrical supply of the heating floor panels is shed.



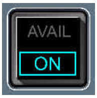
The FAULT light comes on, when the load on any generator is more than 100 % of rated output.

EXT PWR pb

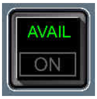


- External power is plugged in, and
- External power parameters are normal.

When pressed:



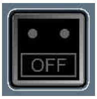
- The external power line contactor closes.



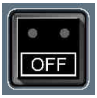
- The external power line contactor opens.

Note: *1. External power has priority over the APU generator. The engine generators have priority over external power.*
2. The ON light stays on, even when the engine generators supply the aircraft.

COMMERCIAL pb ◁✳



All aircraft commercial electrical loads are supplied:
- Cabin and cargo lights
- Water and toilet system
- Drain mast ice protection
- Galley
- Passenger entertainment system
- Semi-automatic cargo loading ◁✳ .



Switches off all aircraft commercial electrical loads.

OVERHEAD PANEL (CONT'D)

OFF
RAT
&
EMER GEN
FAULT
MAN ON
AUTO
3
4
2
1

(1) MAN ON pb (guarded)

AUTO : When the following conditions are met:
- AC BUS 1 is not electrically supplied, and
- AC BUS 2 is not electrically supplied, and
- Aircraft speed is greater than 100 kt.
    - The RAT extends, and
    - The blue hydraulic system drives the emergency generator.

As soon as the emergency generator electrical parameters are within tolerance the emergency generator is connected to the aircraft network.

Pressed : This selects manual RAT extension.
Emergency generator coupling occurs 3 s after the RAT supplies the emergency generator.

(2) FAULT light

This light comes on red if the emergency generator is not supplying power when AC BUS 1 and AC BUS 2 are not powered.

(3) EMER GEN TEST pb (guarded)

Pressed and held:
- If AC NORMAL BUSES are supplied:
    - The EMER GEN is driven hydraulically if the blue electric pump is running.
      The AC ESS BUS and the DC ESS BUS are connected to the emergency generator.
      (The DC ESS SHED and AC ESS SHED buses are not powered.)
    - ECAM displays the ELEC page automatically (only on the ground).
- If only the batteries supply the aircraft:
    - The static inverter powers the AC ESS BUS.

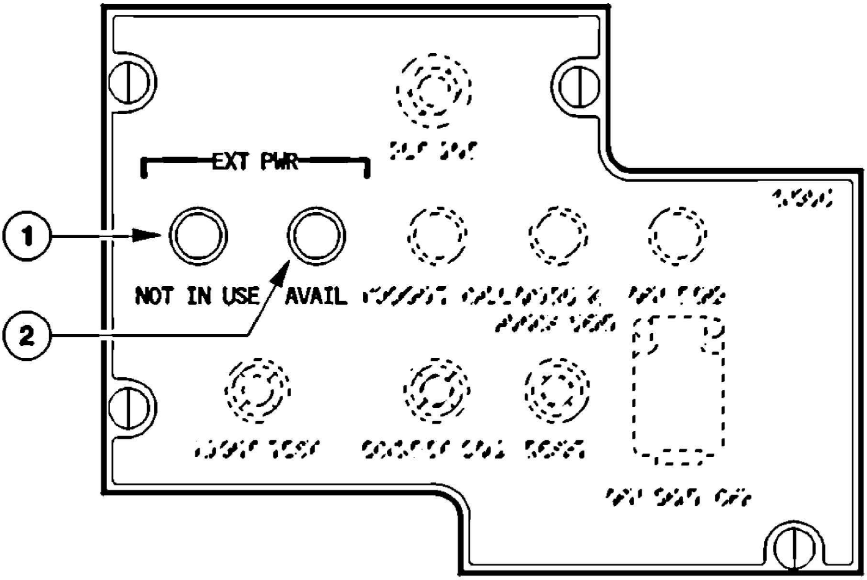
(4) GEN 1 LINE pb-sw

OFF : GEN 1 line contactor opens.
The AC BUS 1 channel is supplied from GEN 2 through bus tie contactors. This is used for smoked drill.

SMOKE light : *Refer to DSC-26-30-20 GEN 1 LINE pb-sw*.

EXTERNAL POWER PANEL

Ident.: DSC-24-20-00000891.0001001 / 21 MAR 16
Applicable to: ALL



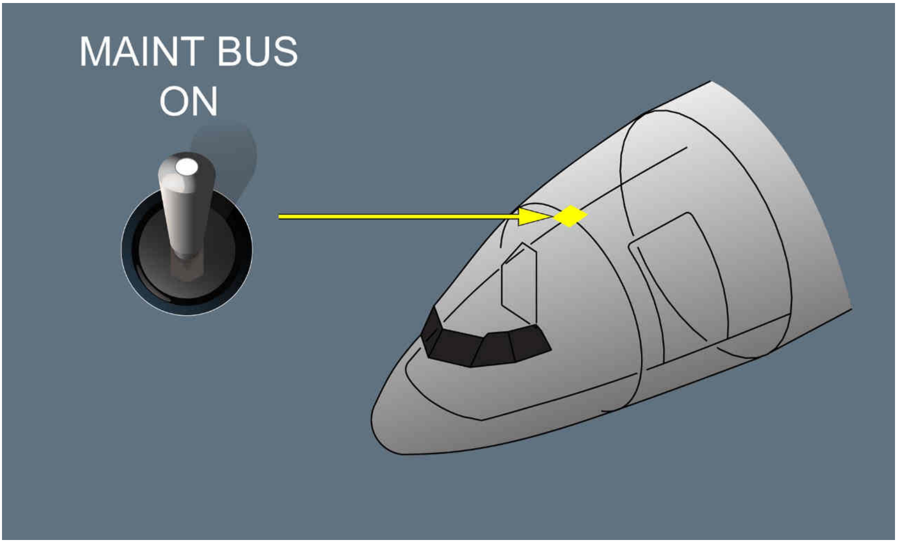
(1) EXT PWR NOT IN USE
This white light comes on to inform ground personnel that the ground power unit is not supplying the aircraft network and can be removed.

(2) EXT PWR AVAIL
This amber light comes on to indicate that external power is available and the voltage is correct.

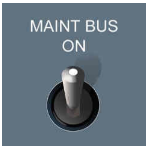
FORWARD CABIN

Ident.: DSC-24-20-00000892.0001001 / 10 MAY 21
Applicable to: ALL

MAINT BUS SW:



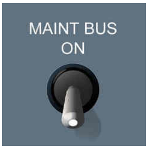
This switch allows personnel to energize electrical circuits for ground servicing without energizing the entire aircraft electrical system.



The switch latches magnetically if external power is connected and normal (AVAIL light on).

The AC and DC GND/FLT buses have power and the following loads can be energized:
- Passenger compartment lighting
- Galley lighting
- Entrance area lights
- Lavatory lighting and service
- Vacuum cleaner sockets
- Flight compartment service outlets
- Hydraulic pump (yellow system)
- Flight compartment flood lighting
- Fuel quantity indications
- Refueling
- Cargo hold lighting
- Main and nose landing gear compartment lighting
- Belly fairing panel service outlets
- Ground call
- Equipment compartment lights and service outlets
- Navigation lights
- Passenger address
- Interphone.

The switch trips when the external source is removed.



The AC and DC GND/FLT buses are connected to AC BUS 2 and DC BUS 2.

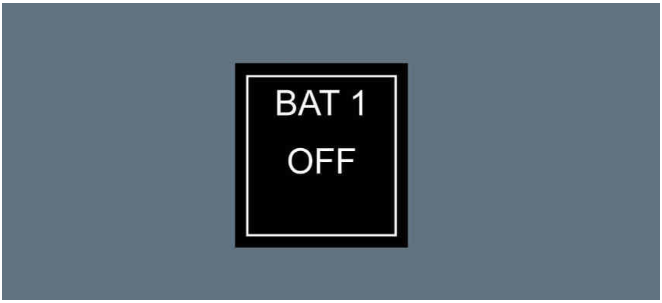
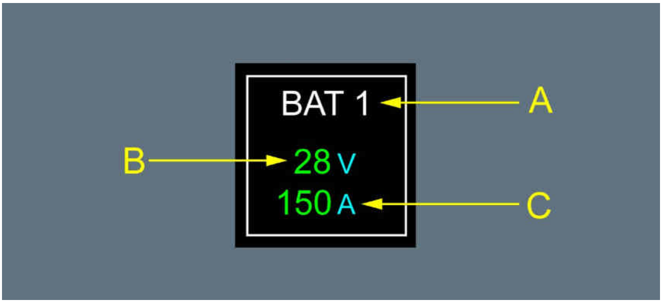
(1) Battery indications
BAT pb-sw at OFF:



BAT pb-sw at Auto:



(A) BAT 1(2) Indication

BAT 1	Normal operation.
BAT 1	This indication is displayed when: - Battery voltage and battery current indications become amber, or - In case of a BAT FAULT alert.

(B) Battery voltage indication

28 V	The battery voltage is normal.
19 V	The battery voltage is below 25 V, or above 31 V.

(C) Battery current indication

1 A	The battery current is normal.

The battery discharge current is above 5 A.

(2) Battery charge/discharge indication

Battery contactor closed. Battery charging current is above 1 A.

Battery contactor closed. Battery discharge current is above 1 A.

Battery contactor closed. Battery current is less than 1 A.

Battery contactor open.

(3) DC BAT indication

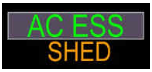
The DC battery is normal.

The DC battery voltage is equal to, or less than 25 V.

(4) Bus bar indication

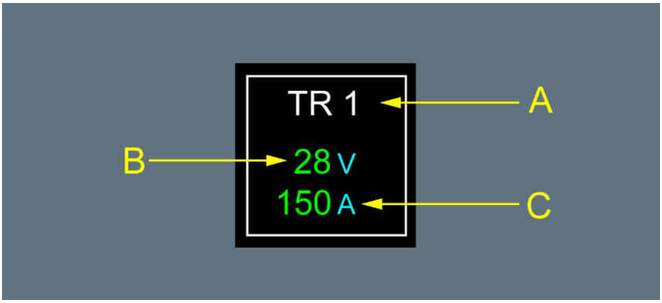
The bus bar is normal.

The corresponding bus bar is not powered.



SHED appears when AC or DC SHED ESS BUS is shed.

(5) TR 1(2) indication



(A) TR legend indication

The TR is powered.

This indication is displayed when:

- The TR voltage indication becomes amber, and
- The TR current indication becomes amber.

(B) TR voltage indication

The TR voltage is normal.

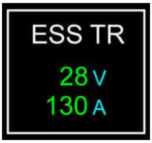
The TR voltage is below 25 V, or above 31 V.

(C) TR current indication

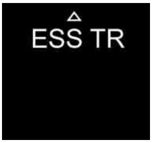
The TR current is normal.

The TR current is equal to, or below 5 A.

(6) ESS TR indication

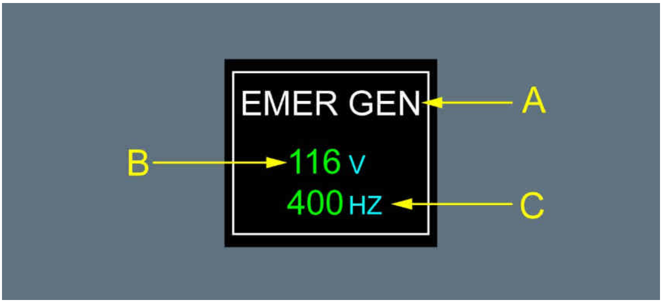


The ESS TR is normal. This legend follows the logic of the above-noted TR 1(2) legend.



The ESS TR contactor is open.

(7) EMER GEN indication



(A) EMER GEN legend indication

EMER GEN	Normal operation.
EMER GEN	This indication is displayed when: - The EMER GEN voltage indication becomes amber, or - The EMER GEN frequency indication becomes amber.

(B) EMER GEN voltage indication

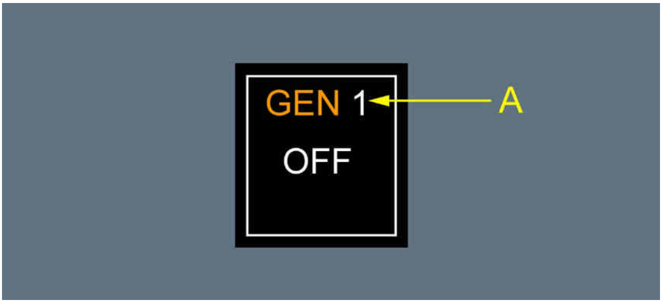
116 V	The EMER GEN voltage is normal.
135 V	The EMER GEN voltage is below 110 V, or above 120 V.

(C) EMER GEN frequency indication

400 HZ	The EMER GEN frequency is normal.
425 HZ	The EMER GEN frequency is below 390 Hz, or above 410 Hz.

Note: The voltage and frequency indications are not displayed, when the EMER GEN line contactor is open.

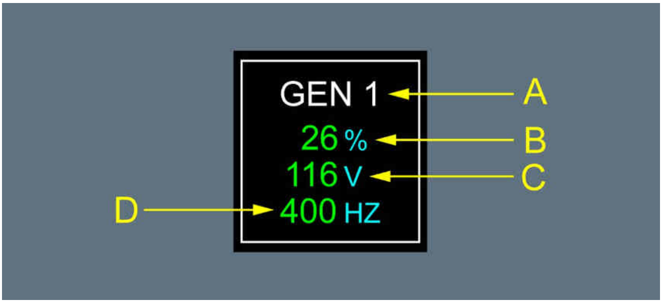
(8) GEN 1(2) indications
When the GEN pb-sw is OFF:



(A) GEN number indication

1	The associated engine is running.
1	The associated engine is not running.

When the GEN pb-sw is ON:



(A) GEN legend indication

GEN 1	Normal operation.
GEN 1	The GEN operation becomes amber, if: - The GEN load indication becomes amber, or - The GEN voltage indication becomes amber, or - The GEN frequency indication becomes amber.

(B) GEN load indication

42 %	Normal operation.

110 %	The engine generator load is above 100 %.

(C) GEN voltage indication

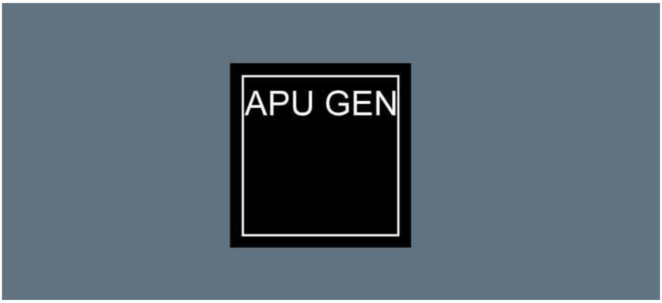
115 V	The engine generator voltage is normal.
125 V	The engine generator voltage is below 110 V, or above 120 V.

(D) GEN frequency indication

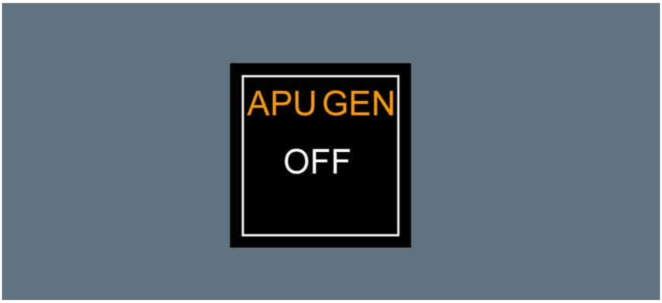
400 HZ	The engine generator frequency is normal.
413 HZ	The engine generator frequency is below 390 Hz, or above 410 Hz.

(9) APU GEN indications

When the APU MASTER SW is OFF regardless of the position of the APU GEN pb-sw:

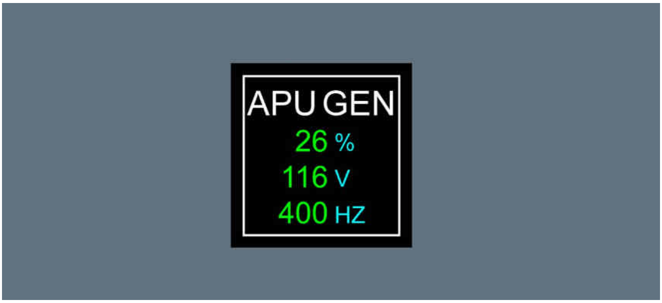


When the APU MASTER SW is ON, and the APU GEN pb-sw is OFF:



When the APU MASTER SW is ON, and the APU GEN pb-sw is ON:

The indications are the same as for GEN 1(2).

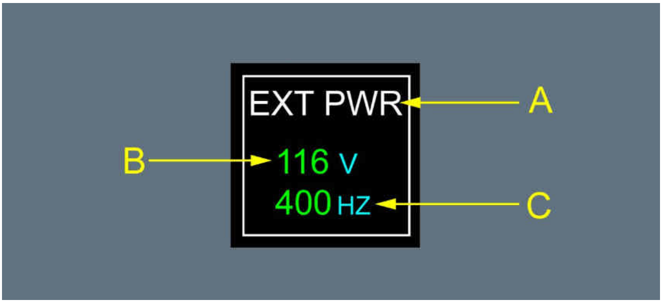


APU GEN
26 %
116 V
400 HZ

(10) EXT PWR indications

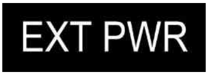
When external power is not available:

When external power is available:

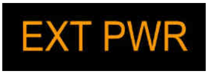


EXT PWR
116 V
400 HZ
A
B
C

(A) EXT PWR legend indication



Normal operation.



The external power operation becomes amber, if:
- The external power voltage indication becomes amber, or
- The external power frequency indication becomes amber.

(B) EXT PWR voltage indication

The external power voltage is normal.

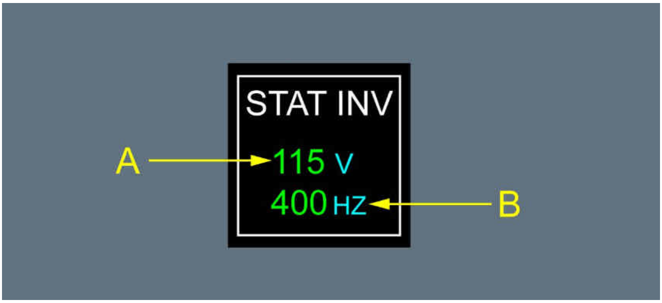
The external power voltage is below 110 V, or above 120 V.

(C) EXT PWR frequency indication

The external power frequency is normal.

The external power frequency is below 390 Hz, or above 410 Hz.

During the static inverter test, and when pressing the ELEC pb on the ECAM control panel while ESS BUSES are supplied by the batteries:



(A) STAT INV voltage indication

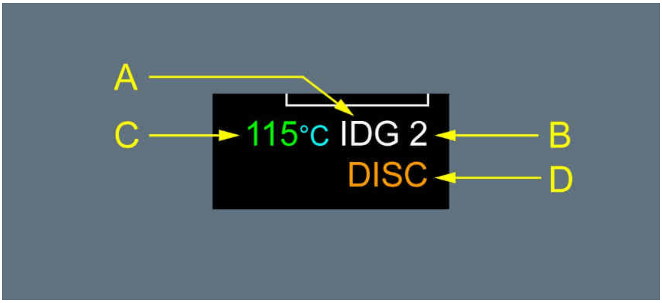
The static inverter voltage is normal.

The static inverter voltage is below 110 V, or above 120 V.

(B) STAT INV frequency indication

400 HZ	The static inverter frequency is normal.
413 HZ	The static inverter frequency is below 390 Hz, or above 410 Hz.

(11) IDG indications



(A) IDG legend indication

IDG	Normal operation.
IDG	This indication is displayed, when: - IDG oil outlet temperature overheat (above 180 °C), or - IDG oil pressure gets too low, or - IDG disconnection.

(B) IDG number indication

2	The associated engine is running.
2	The associated engine is not running and the FADEC is powered.

(C) IDG oil outlet temperature indication

72 °C	Normal operation.
153 °C	It pulses in case of advisory (when the temperature is above 147 °C and when it is at or below 180 °C).
187 °C	There is an overheat on the IDG (above 180 °C).

(D) DISC/LO PR indication

The IDG is disconnected.

This legend appears when IDG low pressure is detected and the associated engine is running.

(12) GALLEY SHED indication

GALLEY
SHED

This legend appears when:
- The GALLEY pb-sw is OFF, or
- The main gelleys are shed, meaning:
  - In flight, only one generator is operating.
  - On ground, the aircraft is being supplied by one engine generator only.

(13) RISE indication ◁

This legend appears when there is a difference between the temperature at the IDG inlet and that at the IDG outlet.

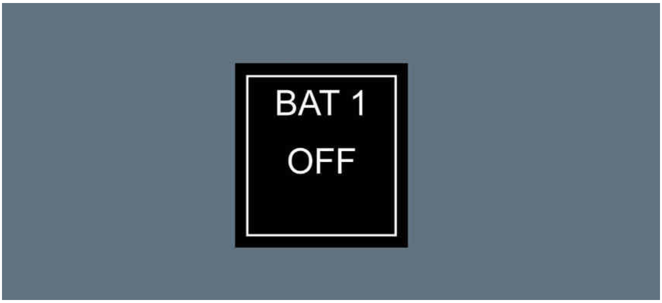
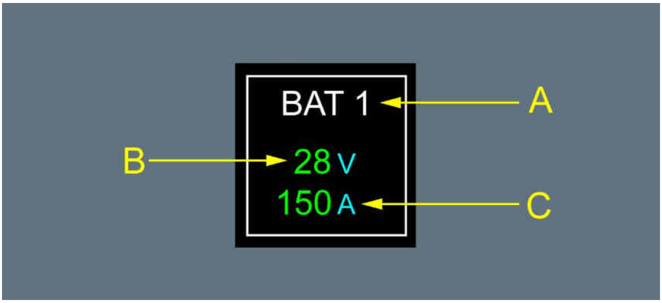
(1) Battery indications
BAT pb-sw at OFF:



BAT pb-sw at Auto:



(A) BAT 1(2) Indication

BAT 1	Normal operation.
BAT 1	This indication is displayed when: - Battery voltage and battery current indications become amber, or - In case of a BAT FAULT alert.

(B) Battery voltage indication

28 V	The battery voltage is normal.
19 V	The battery voltage is below 25 V, or above 31 V.

(C) Battery current indication

1 A	The battery current is normal.

10 A	The battery discharge current is above 5 A.

(2) Battery charge/discharge indication

	Battery contactor closed. Battery charging current is above 1 A.
	Battery contactor closed. Battery discharge current is above 1 A.
	Battery contactor closed. Battery current is less than 1 A.
	Battery contactor open.

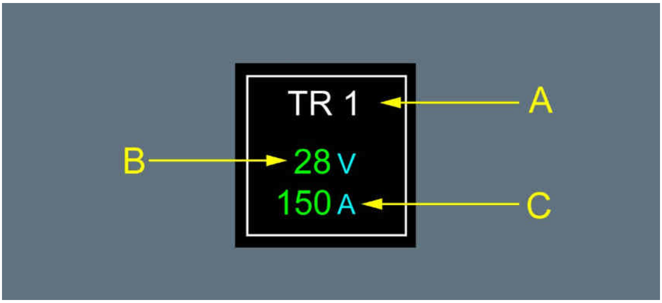
(3) DC BAT indication

DC BAT	The DC battery is normal.
DC BAT	The DC battery voltage is equal to, or less than 25 V.

(4) Bus bar indication

AC 1	The bus bar is normal.
AC 1	The corresponding bus bar is not powered.
AC ESS SHED	SHED appears when AC or DC SHED ESS BUS is shed.

(5) TR 1(2) indication



(A) TR legend indication

The TR is powered.

This indication is displayed when:
- The TR voltage indication becomes amber, and
- The TR current indication becomes amber.

(B) TR voltage indication

The TR voltage is normal.

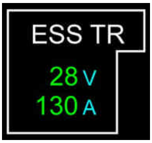
The TR voltage is below 25 V, or above 31 V.

(C) TR current indication

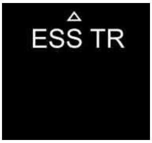
The TR current is normal.

The TR current is equal to, or below 5 A.

(6) ESS TR indication

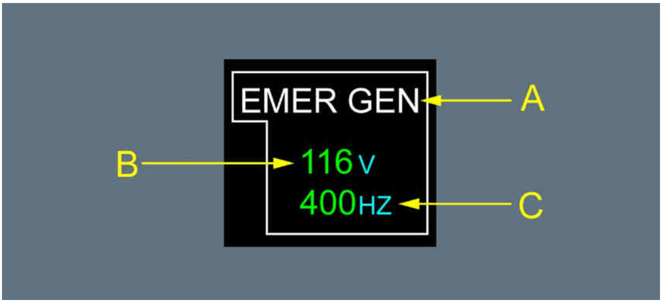


The ESS TR is normal. This legend follows the logic of the above-noted TR 1(2) legend.



The ESS TR contactor is open.

(7) EMER GEN indication



(A) EMER GEN legend indication

EMER GEN	Normal operation.
EMER GEN	This indication is displayed when: - The EMER GEN voltage indication becomes amber, or - The EMER GEN frequency indication becomes amber.

(B) EMER GEN voltage indication

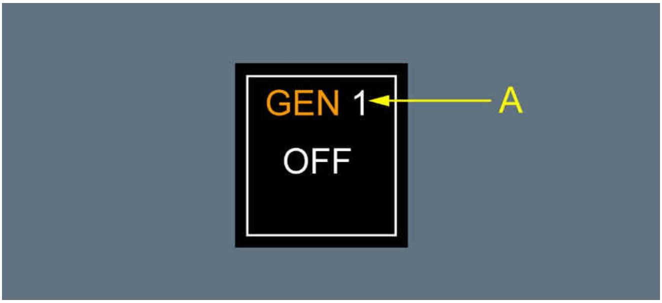
116 V	The EMER GEN voltage is normal.
135 V	The EMER GEN voltage is below 110 V, or above 120 V.

(C) EMER GEN frequency indication

400 HZ	The EMER GEN frequency is normal.
425 HZ	The EMER GEN frequency is below 390 Hz, or above 410 Hz.

Note: The voltage and frequency indications are not displayed, when the EMER GEN line contactor is open.

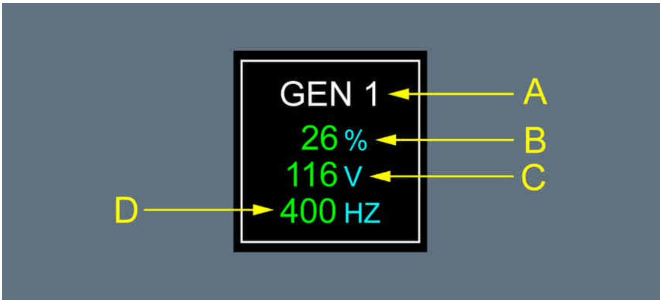
(8) GEN 1(2) indications
When the GEN pb-sw is OFF:



(A) GEN number indication

1	The associated engine is running.
1	The associated engine is not running.

When the GEN pb-sw is ON:



(A) GEN legend indication

GEN 1	Normal operation.
GEN 1	The GEN operation becomes amber, if: - The GEN load indication becomes amber, or - The GEN voltage indication becomes amber, or - The GEN frequency indication becomes amber.

(B) GEN load indication

42 %	Normal operation.

110 %	The engine generator load is above 100 %.

(C) GEN voltage indication

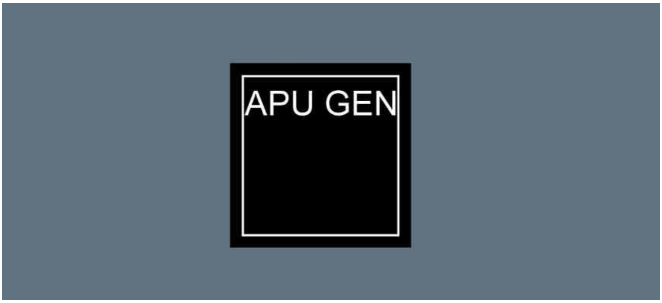
115 V	The engine generator voltage is normal.
125 V	The engine generator voltage is below 110 V, or above 120 V.

(D) GEN frequency indication

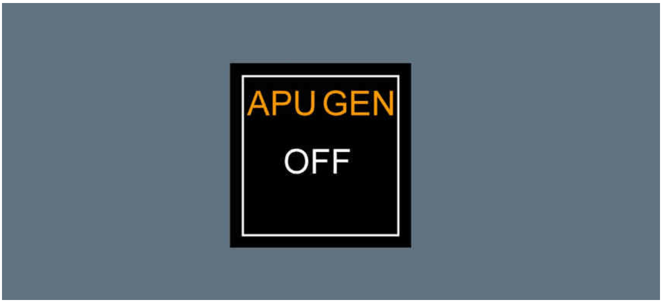
400 HZ	The engine generator frequency is normal.
413 HZ	The engine generator frequency is below 390 Hz, or above 410 Hz.

(9) APU GEN indications

When the APU MASTER SW is OFF regardless of the position of the APU GEN pb-sw:

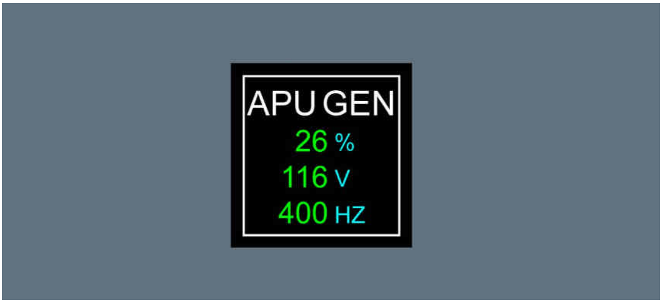


When the APU MASTER SW is ON, and the APU GEN pb-sw is OFF:



When the APU MASTER SW is ON, and the APU GEN pb-sw is ON:

The indications are the same as for GEN 1(2).

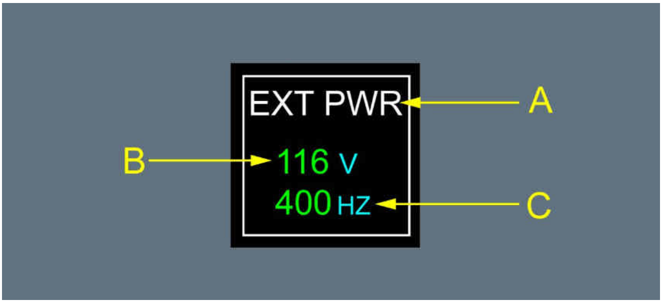


APU GEN
26 %
116 V
400 HZ

(10) EXT PWR indications

When external power is not available:

When external power is available:



EXT PWR
116 V
400 HZ
A
B
C

(A) EXT PWR legend indication

EXT PWR	Normal operation.
EXT PWR	The external power operation becomes amber, if: - The external power voltage indication becomes amber, or - The external power frequency indication becomes amber.

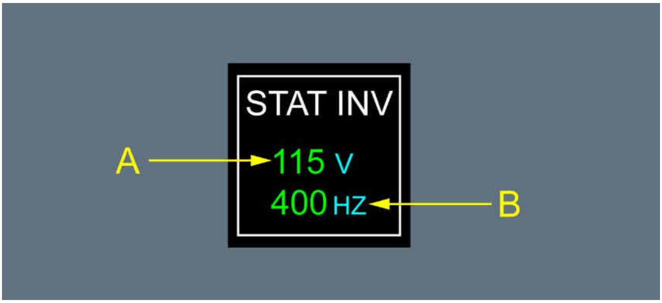
(B) EXT PWR voltage indication

115 V	The external power voltage is normal.
125 V	The external power voltage is below 110 V, or above 120 V.

(C) EXT PWR frequency indication

400 HZ	The external power frequency is normal.
413 HZ	The external power frequency is below 390 Hz, or above 410 Hz.

During the static inverter test, and when pressing the ELEC pb on the ECAM control panel while ESS BUSES are supplied by the batteries:



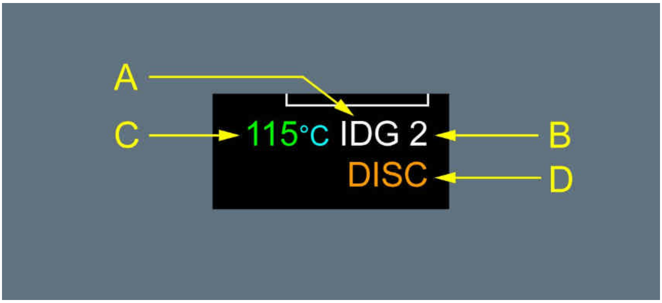
(A) STAT INV voltage indication

115 V	The static inverter voltage is normal.
125 V	The static inverter voltage is below 110 V, or above 120 V.

(B) STAT INV frequency indication

400 HZ	The static inverter frequency is normal.
413 HZ	The static inverter frequency is below 390 Hz, or above 410 Hz.

(11) IDG indications



(A) IDG legend indication

IDG	Normal operation.
IDG	This indication is displayed, when: - IDG oil outlet temperature overheat (above 180 °C), or - IDG oil pressure gets too low, or - IDG disconnection.

(B) IDG number indication

2	The associated engine is running.
2	The associated engine is not running and the FADEC is powered.

(C) IDG oil outlet temperature indication

72 °C	Normal operation.
153 °C	It pulses in case of advisory (when the temperature is above 147 °C and when it is at or below 180 °C).
187 °C	There is an overheat on the IDG (above 180 °C).

(D) DISC/LO PR indication

DISC	The IDG is disconnected.
LO PR	This legend appears when IDG low pressure is detected and the associated engine is running.

(12) GALLEY SHED indication

GALLEY SHED

This legend appears when:
- The GALLEY pb-sw is OFF, or
- The main gelleys are shed, meaning:
  - In flight, only one generator is operating.
  - On ground, the aircraft is being supplied by one engine generator only.

(13) RISE indication

22 RISE	This legend appears when there is a difference between the temperature at the IDG inlet and that at the IDG outlet.

MEMO DISPLAY

Ident.: DSC-24-20-00016808.0001001 / 21 MAR 16
Applicable to: ALL

EMER GEN : This memo appears in green, when the emergency generator is running.

GENERAL

Ident.: DSC-25-10-10-00020853.0001001 / 17 MAR 17
Applicable to: ALL

The aircraft and system controls, required for piloting the aircraft, are arranged in such a way that the crew faces forward and all crewmembers can monitor instruments and systems.
The designers concentrated system controls on the overhead panel by making extensive use of pushbuttons, directly installed in the system synoptic.

Note: *This chapter describes the panels and equipment of the basic aircraft configuration, and may not correspond to the customized configuration of a specific aircraft.*
For more information on the installed equipment or panels, refer to the relevant chapter's system description.

PRINCIPLES FOR PUSHBUTTONS WITH INTEGRATED INDICATIONS

Ident.: DSC-25-10-10-00000983.0001001 / 21 MAR 16
Applicable to: ALL

Whenever possible, pushbuttons used for corrective actions, have integrated status and failure indications.

The pushbutton positions, and their illuminated indications, follow the "lights out" principle.

- While corresponding to particular aircraft configurations, indications also have the following color codes :
  - Warnings
    RED : A failure requiring immediate action.
  - Cautions
    AMBER : A failure, of which the flight crew should be aware, but does not call for immediate action.
  - Indications
    GREEN : For normal system operation.
    BLUE : For normal operation of a system used temporarily
    WHITE :
      - For an abnormal pushbutton position.
      - For a test result or maintenance information.

  When the aircraft is in a normal configuration, only green lights can be permanently lit, whereas blue lights can be intermittently.
- Pushbutton positions :

POSITION	**BASIC FUNCTION**
Pressed In	ON, AUTO, OVRD, OPEN
Released Out	OFF, MAN, ALTN, SHUT

Note: *1. Certain pushbutton lights have two dots, indicating that the corresponding part of the pushbutton is not used.*
2. Certain pushbuttons do not remain pressed in. These are referred to as “Momentary Action” pushbuttons.

PILOT SEAT MECHANICAL ADJUSTMENT

Ident.: DSC-25-10-30-00000989.0001001 / 26 NOV 19
Applicable to: ALL

To mechanically adjust a seat, the occupant must lift the appropriate control handle. This unlocks the seat so that it may be moved. To return the seat to its spring-loaded locked position, release the control handle. On electrically-powered seats, the mechanical adjustment is a backup: Electrically adjust the seat.

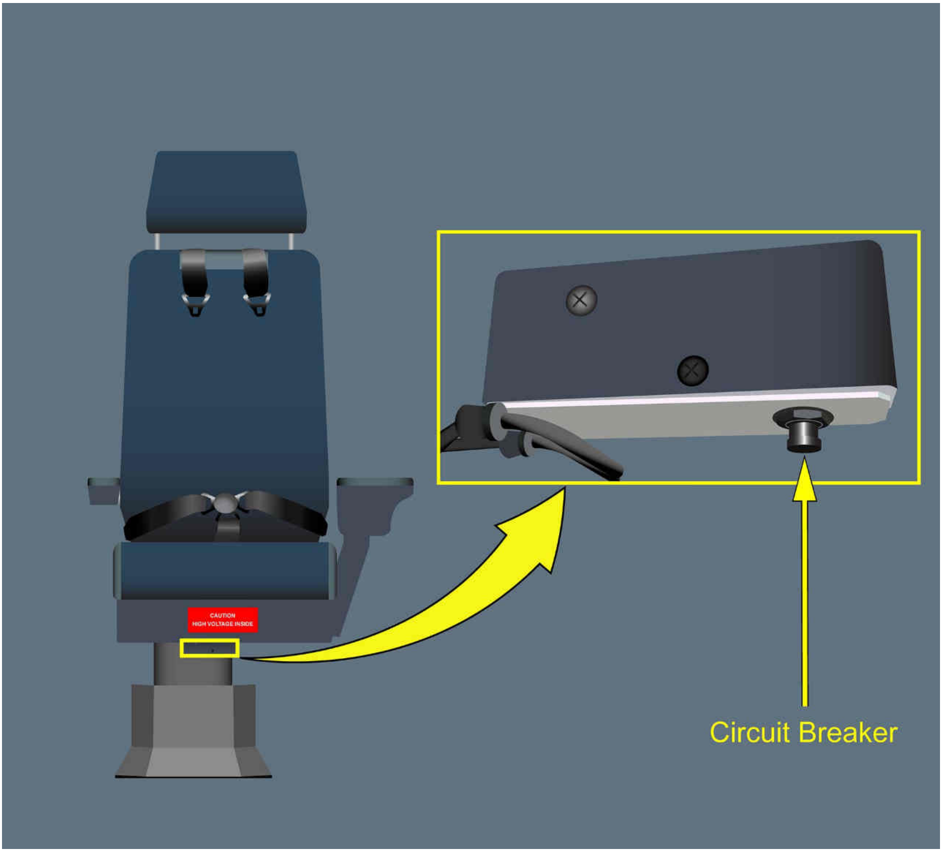
To adjust the vertical position of the lumbar cushion, the occupant must perform all of the following:
- Pull the control handle to the unlocked position
- Turn the control handle, in order to adjust the position of the cushion
- Push the control handle to the locked position.

PILOT SEAT ELECTRICAL ADJUSTMENT

Ident.: DSC-25-10-30-00018405.0001001 / 26 NOV 19
Applicable to: ALL

To electrically adjust a seat, the occupant must press the appropriate control switch in the desired direction. When the seat reaches the desired position, the occupant must release the control switch. The control switch then returns to the spring-loaded neutral position.

L2 Note: *A circuit breaker is under the seat. When this circuit breaker is pulled, it stops the electrical power to the seat.*



HEAD REST ADJUSTMENT

Ident.: DSC-25-10-30-00018406.0001001 / 17 MAR 17
Applicable to: ALL

To adjust the headrest in inclination, the occupant presses the inclination control button, and releases it to lock the position.
To control the height of the headrest, the occupant must push it horizontally, adjust the height, and release it to lock the position.

ARMREST ADJUSTMENT

Ident.: DSC-25-10-30-00000993.0001001 / 21 MAR 17
Applicable to: ALL

To adjust the inboard armrest, the occupant must turn the knurled knob, located on the bottom surface of the armrest.

OBSERVER SEAT

OBSERVER SEAT ADJUSTMENT

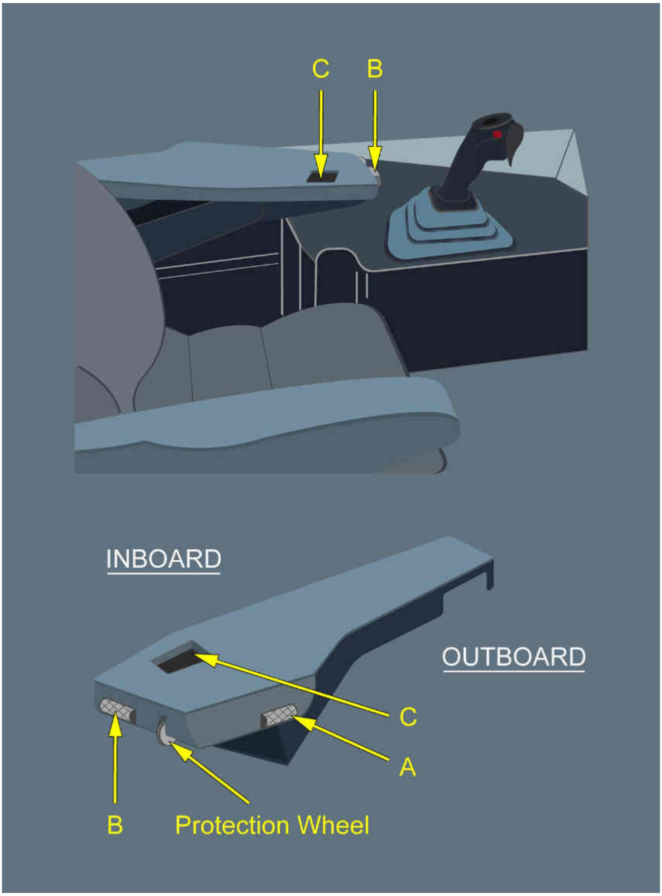
Ident.: DSC-25-10-30-00000995.0001001 / 21 MAR 17
Applicable to: ALL

This seat has three positions :

- Normal : Centered on aircraft axis.
- Intermediate : Clear of the cockpit entrance.
- Stowed : Seat vertical and headrest folded back. The seat is usable in this position, and does not impede access to the documents and equipment on the right side of the cockpit.

PILOT SEAT OUTBOARD ARMREST ADJUSTMENT

Ident.: DSC-25-10-30-00018431.0001001 / 26 NOV 19
Applicable to: ALL



The position of the armrest adjusts as follows:
A. Height adjustment
B. Pitch adjustment

The armrest also has a memory display (C) that displays pitch and height.

DESCRIPTION

Ident.: DSC-26-10-00021387.0006001 / 17 MAR 17
Applicable to: ALL

The fire and smoke protection system includes:
- Fire and overheat detection for the engines and APU
- Smoke detection for the cargo compartments, the lavatories, and the avionics bay
- Fire extinguishing for the cargo compartments, the engines, the APU, and the lavatories.

In addition, the aircraft includes portable fire extinguishers in the cockpit and in the cabin areas.

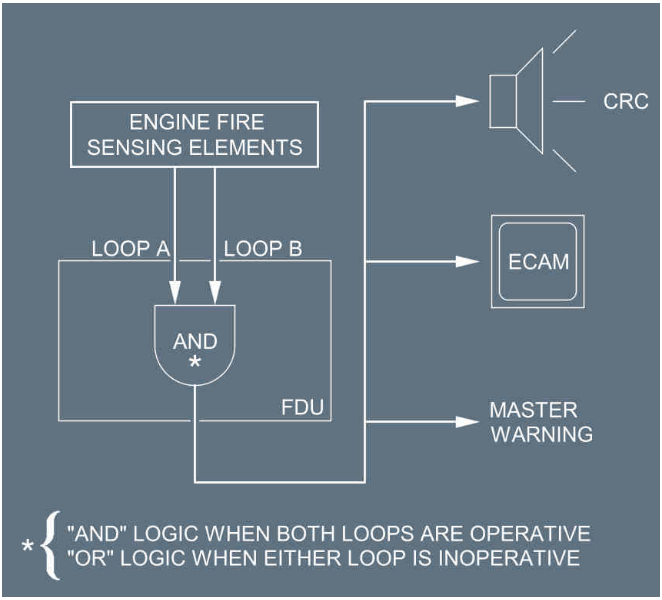
Intentionally left blank

FIRE DETECTION

Ident.: DSC-26-20-10-00021393.0001001 / 17 MAR 17
Applicable to: ALL

The engines and the APU each have a fire and overheat detection system consisting of:
- Two identical detection loops (A and B) mounted in parallel
- A Fire Detection Unit (FDU).

The fire detection loops consist of:
- Three or four (as installed) engine fire sensing elements, in the pylon nacelle, in the engine core, and in the engine fan section
- One fire sensing element in the APU compartment.



ENGINE FIRE SENSING ELEMENTS
LOOP A
LOOP B
AND *
FDU
CRC
ECAM
MASTER WARNING
* "AND" LOGIC WHEN BOTH LOOPS ARE OPERATIVE
"OR" LOGIC WHEN EITHER LOOP IS INOPERATIVE

When a sensing element is subjected to heat, it sends a signal to the FDU. As soon as loops A and B detect temperature above a preset level, the fire warning system is triggered.
A fault in one loop (break or loss of electrical supply) does not affect the warning system and the unaffected loop still protects the aircraft.

EXTINGUISHING

Ident.: DSC-26-20-10-00021395.0001001 / 04 JUL 17
Applicable to: ALL

ENGINES

Each engine has two fire extinguisher bottles, with electrically-operated squibs to discharge their agents. Each squib has a dual electric supply. The flight crew controls the discharge of the fire extinguisher bottles from the FIRE panel in the cockpit.

APU

The APU has one fire extinguisher bottle, with two electrically-operated squibs to discharge its agent. The flight crew controls the discharge of the fire extinguisher bottle from the FIRE panel in the cockpit. When an APU fire is detected on the ground, the APU automatically shuts down, and the extinguisher bottle discharges automatically.

FIRE DETECTION AND DETECTION FAULT LOGIC

Ident.: DSC-26-20-10-00021394.0001001 / 26 OCT 22
Applicable to: ALL

The FDUs process all the warnings and cautions originating in the sensing elements.

A fire warning appears, if:
- Both loops A and B send a fire signal, or
- One loop sends a fire signal and the other one is failed, or
- Breaks occur in both loops within 5 s of each other (flame effect), or
- A test is performed on the FIRE panel

A loop-fault caution appears, if the associated loop is failed.

ENG 1(2) FIRE PB-SW

The PB-SW normal position is in, and guarded. When the flight crew pushes it, the PB-SW is released and sends an electrical signal that performs the following for the corresponding engine:

- Silences the aural fire warning
- Arms the fire extinguisher squibs
- Closes the low-pressure fuel valve
- Closes the hydraulic fire shut off valve
- Closes the engine bleed valve
- Closes the pack flow control valve
- Cuts off the FADEC power supply
- Deactivates the IDG.

The red lights come on, regardless of the PB-SW position, whenever the fire warning for the corresponding engine is activated.

Ident.: DSC-26-20-20-10-00021420.0001001 / 10 MAY 22

AGENT 1(2) PB

Both AGENT pbs of an affected engine become active when the flight crew releases the ENG 1(2) FIRE pb-sw.
A brief push on the PB discharges the corresponding fire agent.

- “SQUIB” comes on white when the flight crew releases the ENG 1(2) FIRE pb-sw to help the flight crew identify the AGENT pb to be activated.
- “DISCH” comes on amber when the corresponding fire extinguisher bottle has lost pressure.

Ident.: DSC-26-20-20-10-00021421.0001001 / 10 MAY 22

ENG 1(2) FIRE TEST PB

This PB tests the operation of the fire detection and extinguishing system for ENG 1(2).

When pressed:
- A CRC sounds
- The MASTER WARNING lights flash
- ENG FIRE warning appears on ECAM.
- On the FIRE panel:
  - The ENG 1(2) FIRE pb-sw lights up red
  - The SQUIB lights come on white if discharge supplies are available
  - The DISCH lights come on amber.
- On the ENG MASTER panel (pedestal):
  - The FIRE lights come on red.

Note: *The FIRE lights do not illuminate in case of Engine Fire Detection Loop A fault on the Engine 1 or Engine Fire Detection Loop B fault on the Engine 2.*

Ident.: DSC-26-20-20-10-00021423.0001001 / 10 MAY 22

APU FIRE PB-SW

The PB-SW normal position is in, and guarded. When the flight crew pushes it, the PB-SW is released and sends an electrical signal that performs the following for the APU:
- Shuts down the APU
- Silences the aural warning
- Arms the squib on the APU fire extinguisher
- Closes the low-pressure fuel valve
- Shuts off the APU fuel pump
- Closes the APU bleed valve and X bleed valve and deactivates the APU generator.

The red lights come on, regardless of the PB-SW position, whenever an APU fire warning is activated.

Ident.: DSC-26-20-20-10-00021424.0001001 / 10 MAY 22

AGENT PB

The APU AGENT pb becomes active when the flight crew releases the APU FIRE pb-sw.
A brief push on the pushbutton discharges the corresponding fire agent.

- “SQUIB” comes on white when the pilot releases the APU FIRE pb-sw.
- “DISCH” comes on amber when the fire extinguisher bottle has lost pressure.

Note: *A red disk, which is outside at the rear of the fuselage, signals that the agent is not discharged overboard due to bottle overpressure.*

Ident.: DSC-26-20-20-10-00021425.0001001 / 10 MAY 22

APU FIRE TEST PB

This PB tests the operation of the APU fire detection and extinguishing system.

When pressed:
- A CRC sounds
- The MASTER WARN light flash
- APU FIRE warning appears on ECAM.
- On the FIRE panel:
  - The APU FIRE pb-sw lights up red
  - The SQUIB light comes on white if discharge supplies are available
  - The DISCH light comes on amber.

Note: *The automatic shutdown of the APU on ground may occur if the flight crew performs this test for more than 3 seconds.*

Note: *If the fire test is performed on ground with only batteries to supply the electrical network, both of the following apply:*

- *The SQUIB light and DISCH light come on, without ECAM warnings*
- *The red APU FIRE pb-sw light partially comes on, as one of the sets of bulbs is not electrically available.*

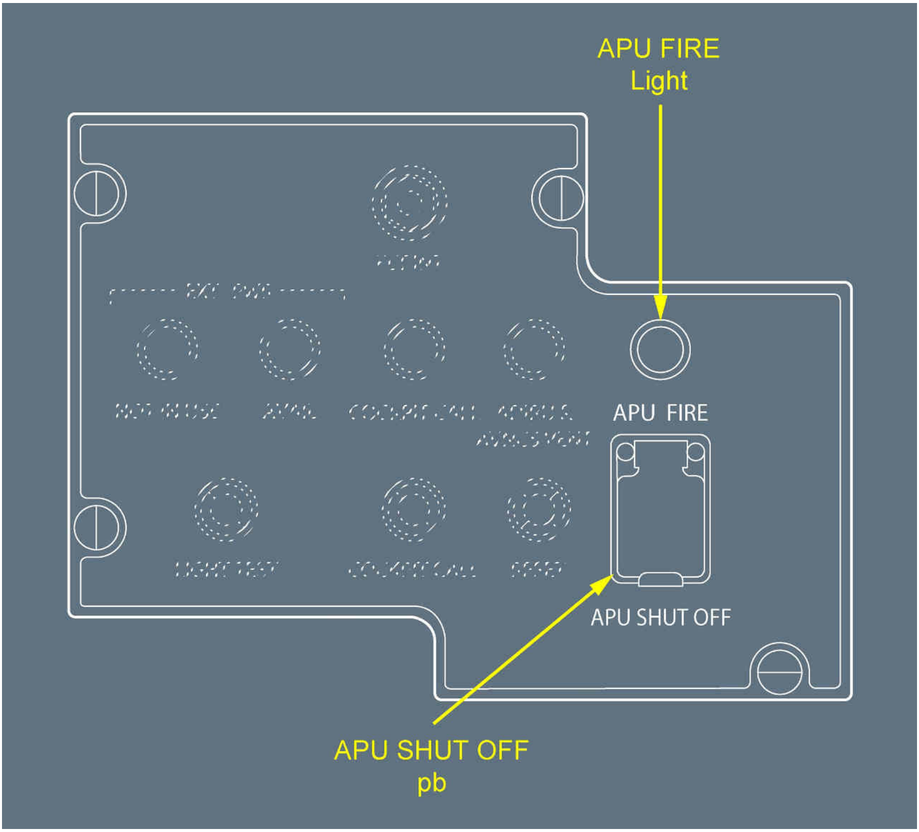
ENG 1(2) FIRE LIGHT

This light identifies the engine to be shutdown in the case of fire.
The light comes on red when an engine fire warning is triggered.

EXTERNAL POWER PANEL

Applicable to: ALL

Ident.: DSC-26-20-20-30-00021429.0001001 / 17 MAR 17



Ident.: DSC-26-20-20-30-00021430.0001001 / 17 MAR 17

APU FIRE LIGHT

The red APU FIRE light comes on and an external warning horn sounds when the system detects an APU fire.
The APU fire extinguisher discharges automatically 3 s after the appearance of the fire warning.
The light goes out when the fire has been extinguished.

Ident.: DSC-26-20-20-30-00021431.0001001 / 17 MAR 17

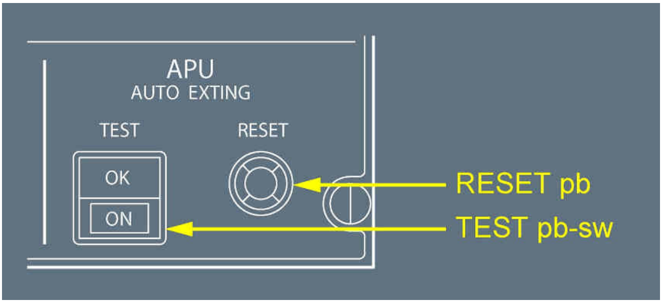
APU SHUT OFF PB

This pushbutton is used for manual APU emergency shutdown, if an emergency situation is detected on ground by the ground crew. When this pushbutton is pressed, the APU low pressure fuel shutoff valve closes, and the ECB receives a signal that starts the shutdown sequence. The shutdown sequence is the same as the APU automatic shutdown sequence, except that there is no cool down cycle. Pressing this pushbutton also silences the external warning horn.

MAINTENANCE PANEL

Applicable to: ALL

Ident.: DSC-26-20-20-40-00021432.0001001 / 17 MAR 17



Ident.: DSC-26-20-20-40-00021435.0001001 / 17 MAR 17

TEST PB-SW

When pressed, tests the following APU circuits:
- Fire warning
- Auto extinguishing
- Shutdown.

During the test sequence, the APU MASTER sw must be ON.
If all circuits are operating correctly, the OK light comes on.

Note: *If the APU was running, it shuts down.*

Ident.: DSC-26-20-20-40-00021436.0001001 / 17 MAR 17

RESET PB

When pressed, resets the test circuit.

SMOKE DETECTION

Ident.: DSC-26-30-10-00021401.0001001 / 17 MAR 17
Applicable to: ALL

The air extraction duct of the avionics ventilation system has one smoke detector.

When smoke is detected for more than 5 s:
- The Single Chime (SC) sounds
- The MASTER CAUTION lights flash
- The ECAM AVIONICS SMOKE alert triggers
- On the EMER ELEC PWR panel, the SMOKE light of the GEN 1 LINE pb-sw comes on
- On the VENTILATION panel, the FAULT lights of the BLOWER pb-sw and the EXTRACT pb-sw come on.
